Introduction

Medieval Iberia: An Encyclopedia is conceived as a single-volume, English-language reference work for scholars, students, and the general public seeking reliable information on subjects concerning the Iberian Peninsula, the geographic area comprised by present-day Spain and Portugal, from the period from approximately 470 to 1500. It consists of over eight hundred alphabetically arranged entries that deal with persons, events, works, institutions, and topics that have a particular relevance to all of medieval Iberia—Muslim, Jewish, and Christian alike. Ranging in length from 250 to 3,000 words, the articles that comprise the book are written by expert contributors, and seek to provide a basic orientation on the various subjects for ready reference. In addition, each entry supplies a selected bibliography of between two and ten items, whenever possible mostly in English. The scope of the work is broad but not comprehensive, with an emphasis on history, literature, language, religion, science, folklore, and the arts, including selected Jewish and Muslim topics. To complement its content and facilitate its use, the book offers a comprehensive index.

Given its broad, multidisciplinary sweep, *Medieval Iberia* is directed at a diverse readership and provides a wide variety of information on a great number of subjects. Literary scholars, for example, will be able to readily consult dates and events of historical importance, while historians will be able to clarify questions dealing with literature. Similarly, someone seeking information on folklore—for example, the Sephardic ballad tradition—may consult an authoritative entry on the latter providing a basic orientation and a selected list of readings that will serve as an introduction to the topic. The undergraduate wishing to write a research paper on scientific, philosophical, and literary translations completed in medieval Iberia, as well as the grade school teacher in need of basic facts about Prince Henry the Navigator and the Portuguese voyages of discovery, will also find this encyclopedia useful. In short, though the majority of its users will doubtless consist of individuals with some prior knowledge of medieval Iberia, and though its principal purpose is to facilitate scholarly access to information not readily available in standard reference sources on the Middle Ages, this volume will also be consulted by members of the general public who simply wish to obtain a succinct summary of a subject along with basic facts about it. On the one hand, then, *Medieval Iberia* serves as a

reference tool for scholars seeking to undertake advanced research in areas of the humanities with which they are unfamiliar; on the other, it functions as a medium for the dissemination of knowledge about medieval Iberian culture and civilization throughout the English-speaking world.

Several criteria govern the scope and the determination of the entries:

1. Entries are generally restricted to the years 470–1500. Hence, Bartolomé de Torres Naharro, whose major literary work was published in 1517, is not included, while Juan del Encina, who completed his first opus in 1493, has an entry. Exceptions to the chronology are made for overlapping subjects that continue to bear significance as well as exercise their influence. Hence, Gil Vicente, the bilingual Portuguese author whose work first appears in 1502 merits coverage based on the close relationship of his theater to that of his predecessor, Encina.
2. Because of the availability of good reference sources on certain well-known entries, coverage has been designed to emphasize the lesser-known aspects of the subject. Thus, for example, the entry on Castilian explorations devotes greater attention to the Canary Islands and the western Atlantic than to Christopher Columbus and America, for which there are useful essays in standard encyclopedias like the *Britannica* and the *Americana*. Similarly, subjects that recent research has reevaluated and whose entries in other sources are now outdated merit attention.
3. Topics are of broad significance. Those that had a wide influence in their own time; those that initiated change; and those that are relevant today outside narrow areas of specialization are all included here. Thus, in the area of literature, key authors, works, concepts, and movements are covered, while more specialized topics in prosody, bibliography, and the like, are not.
4. In general, the shorter entries (250–500 words) are more factually oriented and seek to lead the user to authoritative sources. The longer entries (500–3,000 words), without prejudicing essential facts, tend to be more interpretive and strive to synthesize and place the topic within medieval Iberia as a whole.

INTRODUCTION

Medieval Iberia thus places less emphasis on subjects fully treated in standard reference works and strives to address those areas not adequately covered in the latter. The material is distributed approximately in the following proportions:

- twenty-five percent history (includes biographies, events, politics, law, economics, and the like).
- twenty-five percent literature, language, and culture (includes Arabic, Hebrew, and peninsular Romance languages; oral culture, and folklore).
- twenty-five percent life and society (includes religion, education, agriculture, popular causes, and so on).
- fifteen percent philosophy and science (includes Christian, Moslem, and Jewish topics).
- ten percent arts (architecture, music, painting).

Since *Medieval Iberia* provides information about subjects not easily located in reference works addressing all of the Middle Ages or medieval history exclusively, sources like the *Dictionary of the Middle Ages*, and *The Middle Ages: A Concise Encyclopedia*, though they cover only some Iberian themes, may be viewed as complements to this volume.

The entries are arranged according to several criteria. In listing literary works, preference is given to the names of authors, whenever known, rather than to titles; thus, *Milagros de Nuestra Señora* will be found under Gonzalo de Berceo and *Proverbios morales* will appear under Shem Tov of Carrión. Anonymous works generally appear under the commonly used form of the title; thus the *Libro de Alexandre* will appear under *Libro* but at the same time has a cross-reference from Alexander of Macedonia. In cases where titles are significantly ambivalent, as in *Cantar* vs. *Poema de Mio Cid*, the placement for the entry was left to the author of the entry to decide, vouchsafed by a cross-reference from the form of the entry not chosen. The form used to alphabetize individual names has often proved problematical. Strictly speaking, Gil Alvarez Carrillo de Albornoz should appear under Alvarez Carrillo de Albornoz, yet he is generally known as Gil de Albornoz. He will thus be located under Albornoz, which we have chosen in order to respect general usage and avoid confusion. The Spanish forms of the names of kings and nobles most currently in use in historical and literary research has also been given preference over English. Hence, rather than Henry IV and Isabella I of Castile, and Alfonso V of Portugal, we use Enrique IV and Isabel I of Castile, and Afonso V of Portugal. The same is true of certain place- and saints' names. Thus, Zaragoza and Mallorca are preferred to the English Saragossa and Majorca, although Seville and Lisbon are used in place of Sevilla and Lisboa; and St.

Dominic, the founder of the Order of Preachers, can be found under Domingo de Guzmán as opposed to Dominic of Guzman, or St. Dominic. Loconymns have proved especially difficult and we have tried to resolve confusion in the following fashion: In the case of individual nobles and royals, listing can be found under their first name. Thus, Constanza de Mallorca may be found under Constanza and not Mallorca or de Mallorca. Others, whose loconymns are currently used in research as if they were last names, appear under their loconymns. Hence the fifteenth-century *converso* (Christian convert) poet Antón de Montoro is located under Montoro and not Antón, and Alonso Fernández de Madrigal may be found under Madrigal, and not Fernández de Madrigal. Finally, to facilitate the book's use by a broad range of individuals, all dates are given according to the familiar Gregorian calendar. The norms for the transliteration of Arabic into the Latin alphabet are placed at the end of this introduction.

This volume includes illustrations, maps, genealogies, and lines of succession that seek visually to complement or clarify the subjects they accompany. The index at the end is intended to guide users to topics that are frequently cited in the volume but lack their own entries. The bibliographies accompanying the entries are organized alphabetically first by author and, in the case of edited works or numerous works by a single author, then by title. They are composed of selected items and are intended only to provide reference materials to enable the student or scholar to move confidently into the subject.

Given the substantial academic interest in medieval studies, the recognition of Iberia's increasing importance within medieval culture, and an increased general interest in Iberia and in Hispanic culture in the United States and Britain, this encyclopedia seems not only desirable but timely and necessary. It should be welcomed by Hispanists of all disciplines, academics interested in learning more about Spain's and Portugal's crucial contributions to one of the formative periods of Western civilization, and the lay reader wishing to find information concerning Iberia's fundamental role in the creation of world culture. There is no equivalent reference source to *Medieval Iberia* in either English or Spanish.

Under the direction of general editor E. Michael Gerli and the board of associate editors, *Medieval Iberia* has been completed with the advice and direction provided by of a group of internationally distinguished scholars: the historians Robert I. Burns, S.J., Joseph F. O'Callaghan, and Norman Roth; the musicologist Robert Stevenson; the literary and intellectual historians Alan D. Deyermond, Pedro M. Cátedra, and Harold

V. Livermore; the folklorist, medievalist, and ballad expert Samuel G. Armistead; and the art historian Ana Domínguez Rodríguez. In consultation with the associate editors, the general editor has been responsible for proposing and establishing the list of entries as well

as identifying potential contributors with the necessary expertise to produce authoritative articles on each of the topics selected for inclusion. He and an expert team of reference editors at Routledge have overseen the final editing and production of the manuscript.

Acknowledgments

A volume like this could not have been produced without the cooperation of literally hundreds of individuals, who gave of their time, enthusiasm, energy, and good will over a number of years to see it to completion. The editors are especially grateful to the indefatigable Gary Kuris, who originally proposed the work more than a decade ago, when he was editor at Garland; to numerous graduate students at both Georgetown University and the University of Virginia—Mary Zampini, Christopher McDonald, Laura Labauve, Pedro Pérez Leal, Matthew Bentley, and others—who helped with correspondence, filing, translation, and in the day-to-day organization of the myriad tasks involved in gathering, compiling, and sorting the entries; and to the editorial team at Routledge Reference in New York, who saved the project from oblivion and supplied their astonishing professional acumen to see it

to its final publication. Among the latter group, special credit is reserved for Marie-Claire Antoine, who provided the basic impetus for the work's resurrection after five years of uncertainty; for Mark O'Malley, who with good humor, a deep sense of duty, and a youthful, sturdy constitution literally ran up and down the spiral staircase in the last weeks of its production; and for Kate Aker, who with austere reminders and stern words kept an unbending schedule and unraveling sensibilities always intact. Finally, the greatest credit is due to the associate editors and the scholars on two continents who gave of their time, good will, deep knowledge, and profound love of Hispanism to compose, read, edit, and check the entries and the accompanying bibliographies that comprise this work. *Jubilate! Fortuna favet fortibus.*

Publisher's Note

The Routledge Encyclopedias of the Middle Ages

Formerly the Garland Encyclopedias of the Middle Ages, this comprehensive series began in 1993 with the publication of *Medieval Scandinavia*. A major enterprise in medieval scholarship, the series brings the expertise of scholars specializing in myriad aspects of the medieval world together in a reference source accessible to students and the general public as well as to historians and scholars in related fields. Each volume focuses on a geographical area or theme important to medieval studies and is edited by a specialist in that field, who has called upon a board of consulting editors to establish the article list and review the articles. Each article is contributed by a scholar and followed by a bibliography and cross-references to guide further research.

Routledge is proud to carry on the tradition established by the first volumes in this important series. As the series continues to grow, we hope that it will provide the most comprehensive and detailed view of the

medieval world in all its aspects ever presented in encyclopedia form.

Vol. 1 *Medieval Scandinavia: An Encyclopedia*. Edited by Phillip Pulsiano.

Vol. 2 *Medieval France: An Encyclopedia*. Edited by William W. Kibler and Grover A. Zinn.

Vol. 3 *Medieval England: An Encyclopedia*. Edited by Paul E. Szarmach, M. Teresa Tavormin, and Joel T. Rosenthal.

Vol. 4 *Medieval Archaeology: An Encyclopedia*. Edited by Pamela Crabtree.

Vol. 5 *Trade, Travel, and Exploration in the Middle Ages*. Edited by John Block Friedman and Kristen Mossler Figg.

Vol. 6 *Medieval Germany: An Encyclopedia*. Edited by John M. Jeep.

Vol. 7 *Medieval Jewish Civilization: An Encyclopedia*. Edited by Norman Roth

The present volume, *Medieval Iberia: An Encyclopedia*, edited by Michael Gerli, is Volume 8 in the series.

ABBADIDS See BANU ABBAD

ABBEY OF POBLET

Royal abbey and the premier Cistercian house in the Iberian Peninsula. Ramón Berenguer IV, Count of Barcelona (1131–1162) and Prince of Aragón (1137–1162) in 1149, founded Poblet twenty miles northeast of Tarragona with monks from Fontfroide (near Narbonne), a daughter-house of Clairvaux. Royal and noble gifts of vast lands acquired from the reconquest; the strategy of using loans and tax exemptions to attract peasant tenants for the exploitation of these estates; sheep farming on a vast scale; the early-adopted policy of accepting mortgaged land protected by royal privilege from the claims of creditors; the acquisition of a monopoly of the milling industry along the upper Francal River; and the expectation of landed or cash dowries—these economic practices yielded prodigious wealth. By 1297 the abbey possessed 55,000 acres divided into granges, twenty-nine villages, thirty-eight castles, and other properties.

Much of this wealth was spent on the construction of the abbey church and conventual buildings. The classic expression of Cistercian architecture in Spain and sometimes called the “Escorial of Aragón,” though an austere Romanesque enriched by Gothic ogive vaulting, the church extends 85 meters long, with the vaulting over the nave rising 28 meters. Because the monastery held a strategic position in a frontier region commanding the Tarragona-Lérida highway and successive princes considered it of major military importance, heavily fortified walls and bastions surround the church and domestic buildings; the massive royal palace to the east of the church bears comparison with the palace of the popes at Avignon. In 1194, Alfonso II (1162–1196) held his court at Poblet and was later buried there; Pedro IV (1336–1387) conceived of Poblet as a dynastic mausoleum.

Poblet further exploited its wealth by serving as banker to the crown and nobility of Aragón. The abbey

financed wars against the Muslims, the expeditions of Jaime I (1213–1276) against Mallorca and Valencia; the defense of Pedro III (1276–1285) against French invasion. Because the abbey exercised a stabilizing influence in a frontier region, and because it had pastoral responsibilities over a steadily expanding rural population, Poblet sought, and Pope Honorius granted, the abbot episcopal status. In 1336–1337, the Cistercian Pope Benedict XII granted the abbot the right to wear full pontificalia—mitre, ring, and sandals. If these liturgical practices, these economic and political activities blatantly violated the Cistercian constitutions, they were justified on the grounds of service to the crown, especially in its struggle against the Muslims.

Throughout the Middle Ages the recruits of choir monks came primarily from the nobility. Although badly hit by the Black Death—in 1348 alone, 2 abbots, 59 choir monks, and 30 lay brothers succumbed—numbers remained stable through the fourteenth and fifteenth centuries, with about ninety choir monks, while the number of lay brothers grew from eighty-five in 1311 to 135 in 1493. Poblet made four foundations of sister houses in the late Middle Ages. In 1531–1533, numbers stood at 60 choir monks and 30 lay brothers.

The abbey underwent continual remodeling until the late eighteenth century. Although the Cistercian order was suppressed in Spain in 1835, the monastic buildings remained in such excellent condition that when Poblet was restored in 1940, a community soon flourished. Unlike most monastic houses in the late twentieth century, Poblet has suffered no dearth of recruits, and in 1967 it made a foundation, Solius, in the province of Girona.

ABBEYS, ROYAL

In the twelfth and thirteenth centuries, the period of the expansion of Latin Christendom into frontier regions such as the Iberian Peninsula, first the Cistercian monks, and later the military orders and the mendicant friars proved highly effective agents in the spread of a common culture. The Cistercians and the new orders, rather than the Benedictines, acquired lands and ecclesiastical powers; they were the great beneficiaries of the *reconquista* (Reconquest).

A distinctive feature of Iberian monasticism in this period of expansion was the conjunction or union of the monastery and the royal palace. Leaders of the Reconquest, the count-princes pushed back Islam and established monasteries for the military, as well as the religious and cultural security and integrity of conquered areas. Kings built their residences at some monasteries and formed close associations with them during their lifetimes; the construction of royal tombs in the monastic churches represented monastic support for royal power. While not totally unique to the Iberian Peninsula—the histories of the imperial abbey of Farfa in central Italy; of the abbey of Saint Denis near Paris and the Capetian dynasty; of the abbey of Saint Peter at Westminster near London and the English monarchy; and of the German *Reichsabteien*—all bear comparison to Iberian counterparts. But in contrast to other parts of Europe, where the inspiration for a monastic foundation came from individuals considered outstanding for their piety, in Iberia the impulse for a new foundation came from princes who built and endowed abbeys as spiritual supports for their power, resided in them, and were buried in tombs attached to them. As agents of princely power, royal abbeys lacked the political and religious independence characteristic of monasticism in England and Germany. Probably the most famous royal abbeys in Iberia, all of them Cistercian, were Poblet (1149) and Santas Creus (1150) in Catalanian Aragón; Las Huelgas (1187) in Castile, the only house of women among the royal abbeys, whose abbess was always a royal princess and all the nuns recruited from the highest aristocracy; and Alcobaça (1158) located between Lisbon and Coimbra, the “mother house” of all twelve Cistercian abbeys in Portugal, a center of rich cultural activity, and sometimes described as “one of the greatest monastic establishments in Europe.”

By the seventh century and throughout the Middle Ages, Spanish monasteries, like those in other parts of western Europe and on the basis of scriptural precedent (1 Sam. 1 and Luke 1:63–80) and conciliar decrees (Fourth Council of Toledo, 633), accepted boys or girls as oblates, offerings given to the house by their parents. These children, overwhelmingly descended from the

nobility since a dowry was required or at least expected, raised and educated by the monastic community, made monastic profession (public statement of the vows of obedience, stability in the house of profession, and conversion of life) at about age sixteen and were thereafter denied a return to lay society. In Castile and elsewhere the nobility, wishing to preserve family estates intact, entailed them on the eldest son. Apart from the knightly life, careers in monasteries or dioceses represented virtually the only socially acceptable profession. Although the twelfth and thirteenth centuries witnessed the highpoint of child oblation, perhaps the most economically viable and humane way of divesting a family of superfluous or awkward children, the practice continued at least into the seventeenth century.

As in observant houses everywhere, the *Opus Dei* (Work of God, the monastic office to which St. Benedict had said nothing should be preferred) constituted the major work of the royal abbeys. The proximity of the royal court meant that chanceries drew on the monks for clerks, secretaries, treasurers, diplomats, and other officials. As monasteries acquired properties, some monks were assigned the supervision of them and of the revenues they yielded. The schools and libraries of some houses, such as Alcobaça, enjoyed considerable reputations for scholarship. The bulk of the wealth of the royal abbeys seems to have been spent on the decoration and expansion of the abbey church and buildings, and on charitable services to the local poor.

In 1562, King Felipe II decided to build a monastery to memorialize the Spanish victory over the French at Saint Quentin (1557). The vast granite buildings of the abbey of Saint Lawrence in the village of El Escorial near Madrid (constructed 1563–1584) was intended to combine the functions of a Hieronymite monastery for 250 monks in which the king had his own cell, a royal residence, and center of imperial administration, and a mausoleum for the dynasty. The idea for the Escorial rested on a long tradition.

‘ABD AL-‘AZĪZ IBN MŪṢĀ

The son of Mūṣā Ibn Nusayr, who in 711 had sent Tāriq across the Straits of Gibraltar to conquer Iberia, ‘Abd al-‘Azīz Ibn Mūṣā governed al-Andalus from 714

to 716. During his tenure, he proved a capable and imaginative administrator who established Seville as his capital, and from there directed the Muslim conquest of the Iberian Peninsula toward the east, west, and south, consolidating and extending his power to Portugal, Málaga, Granada, Orihuela, Girona, and Barcelona. He was the first Muslim governor to organize the financial and administrative affairs of the newly conquered territories of Iberia, and he sought to eliminate the ethnic distinctions in government service between Berbers and Arabs. ‘Abd al-‘Aziz encouraged intermarriage between the Islamic conquerors and the native Iberian population. While his political and administrative program for the period immediately after the Conquest was generally successful, as a result of his marriage to Egilona, who was either the sister or the widow of Rodrigo, the last Visigothic king, he was accused by both Arabs and Berbers alike of favoring the native Christian population and of having monarchical ambitions. ‘Abd al-‘Aziz was said to have been urged by Egilona to wear a crown on his head and to adopt the manner of a western monarch. Tensions grew within the army just as his father, Mūsā Ibn Nusayr, had been recalled from North Africa and was disgraced by the Caliph in Damascus. ‘Abd al-‘Aziz Ibn Mūsā was executed in 716 on the grounds that he was seeking to separate himself and al-Andalus from Damascus.

‘ABD ALLĀH, EMIR OF CÓRDOBA

‘Abd Allāh Ibn Muḥammad I was the grandson of ‘Abd al-Raḥmān II and grandfather of ‘Abd al-Raḥmān III. He succeeded his brother, al-Mundhir, as emir of al-Andalus in 888 and ruled until 912.

‘Abd Allāh, born in 844, was forty-four years old when his brother died fighting the rebel Ibn Hafṣūn (some have accused ‘Abd Allāh of Hafṣūn fratricide). ‘Abd Allāh’s reign was characterized by violence and upheaval—at times, he controlled only the city of Córdoba, which itself was full of tensions between “old” and “new” (*muwallad*) Muslims.

Arab biographers describe ‘Abd Allāh as being particularly pious, yet they also note his cruelty in dealing with enemies. ‘Abd Allāh quickly alienated most segments of the population, especially his own family. He is said to have encouraged the stabbing death of his son Muḥammad at the hands of his other son, al-

Muṭarrif. Al-Muṭarrif, in turn, was killed after being accused of conspiring with the leaders of Seville. Two of ‘Abd Allāh’s brothers were killed when they became too powerful. These harsh measures only served to further weaken the prestige of the Umayyad family as a whole and reflected the disintegration of centralized power at this time.

With a weak and paranoid-reclusive authority in Córdoba, the administrative and tax structure established by ‘Abd al-Raḥmān II completely fell apart. Strong local families quickly removed any remaining Umayyad-appointed governors and kept the taxes for themselves to maintain standing armies. Of the many provincial revolts that took place during ‘Abd Allāh’s reign, the most significant was the revolt of the *muwallad* Ibn Hafṣūn in Bobastro, in a mountain valley outside Córdoba. He had begun his revolt in 881 during the reign of Muḥammad I, and under ‘Abd Allāh’s nose, Ibn Hafṣūn began conducting raids right up to the walls of Córdoba itself with impunity. Until he announced his conversion to Christianity in 899, Ibn Hafṣūn was the unofficial leader of the *muwallad* factions of the lower Guadalquivir valley; after 899, he slowly lost most of his Muslim supporters. Other strong *muwallad* rebels at this time were Daysam Ibn Ishāq of Murcia and Ibrāhīm Ibn al-Ḥajjāj of Seville.

Without doubt the best decision ‘Abd Allāh made during his reign was selecting and training his grandson ‘Abd al-Raḥmān as heir. When ‘Abd Allāh died in 912, ‘Abd al-Raḥmān III peacefully ascended to the throne and began a reign that ultimately proved to be the high point of Umayyad power in Spain.

‘ABDALLĀH IBN BULLUGIN, KING OF GRANADA

The last Zīrid king of Granada. He reigned from 1073 to 1090. His memoirs, written after being exiled to Morocco, were discovered in the last century in a mosque and have been translated into Spanish under the title *El siglo XI en primera persona*. They reveal precious information concerning the interaction of the members of his family and other *tawā’if* (party) kingdoms as well as the internal political administration of Granada shortly before the advent of the Almoravid invasion. Of particular interest are the details concerning the rise to power of his kinsman and predecessor,

Badis, who was helped by the Jewish magnate Samuel Ibn Nagrillah, who was generously compensated by being named vizier and put in charge of the finances of the kingdom.

‘Abdallāh was a minor when he acceded to the throne in 1073. During his minority his tutor, Sīmacha, an astute and able individual, grasped the power of the monarchy for himself and continued to exercise it well after his pupil had come of age. Pressed during his reign by incursions into Granadan territory by the ‘Ab-bādis of Seville and Alfonso VI of Castile, ‘Abdallāh’s time on the throne of Granada was made even more difficult by rivalries among his lieutenants and dissent in the army. When Sīmacha was expelled from court, he fled the kingdom and sowed conflict from afar between ‘Abdallāh and his brother, Tamīm of Málaga. In his memoirs, ‘Abdallāh vividly recalls how Alfonso VI took advantage of this situation by extorting huge sums from him in order to guarantee his protection.

Faced with a deteriorating situation in the Iberian Peninsula, aggravated by mutual competition and conquest between Muslims, ‘Abdallāh finally joined other tawā’if kings in seeking protection against Alfonso from Muslims abroad. In the end, Yūsuf Ibn Tashfin, the emperor of the Almoravids who had been called in by his coreligionists from North Africa to save them from the Castilians and from themselves, arrogated all power in al-Andalus to himself, deposing ‘Abdallāh and exiling him across the straits, from where he wrote his illuminating memoirs.

‘ABD AL-RAḤMĀN I, EMIR OF CÓRDOBA

‘Abd al-Raḥmān I Ibn Mu‘āwiya Ibn Hishām Ibn ‘Abd al-Mālīk Ibn Marwān was the founder of the Muslim Umayyad dynasty that ruled Spain from 756 to 1031. He was born in Damascus in 731 and is purported to be the only member of the Umayyad family who survived their overthrow in 750 by the ‘Abbasids. ‘Abd al-Raḥmān escaped first to Palestine, then to Egypt, and then on to Morocco, where he took refuge with the Nafza Berber tribe, of which his mother was a member. When his efforts to gain power among the Moroccan Berbers failed, he looked to Spain, where

the lack of unity among the Muslim conquerors—Yemeni Arabs, Syrian Arabs, and recently converted Berbers and Iberians—made for an easy conquest. Because of this successful entry and establishment of a dynasty, ‘Abd al-Raḥmān is known as *al-Dākhil*, or “the Immigrant.”

At the time of ‘Abd al-Raḥmān I’s entry into Spain in 756, Yūsuf Ibn ‘Abd al-Raḥmān al-Fihri was the local governor appointed by the Umayyad regional governor in Qayrawān (in Tunisia). Like the many provincial governors who had preceded him since the Muslim conquest of Spain in 711, Yūsuf struggled to manage the infighting between the Arabs and Berbers. The Berbers formed a vast majority and resented the pretension of racial and cultural superiority of the Arabs despite Islam’s injunction of equality. Yūsuf also had to deal with the perennial feuding (which dated back to pre-Islamic Arabia) between the Yemeni and Syrian Arab tribes. A large Syrian army contingent had entered Spain in 742 after being defeated by the Berbers in North Africa, several years after the original Yemeni conquerors, and there were power struggles between the “new” and “old” invaders. ‘Abd al-Raḥmān I took advantage of this rivalry and the support of Umayyad clients already in the peninsula. He arrived in Seville in 756 and, gathering forces along the way, defeated Yūsuf al-Fihri on the outskirts of Córdoba. ‘Abd al-Raḥmān I proclaimed himself emir of al-Andalus (the Arabic name for the portion of Iberia controlled by the Muslims), refusing allegiance to the ‘Abbasids but recognizing their caliphal claim.

‘Abd al-Raḥmān I ruled al-Andalus for over thirty-three years and spent most of that time struggling with the same problems of unity that the governors before him had faced: Berbers who had been settled in the geographically familiar mountainous north and northwest regularly rebelled against the central Córdoba authority; the Arabs, who had settled along tribal lines in various towns in the south and southeast, continued to feud; the local converts, or muwallads, felt as unjustly treated as the Berbers and often rebelled; and in the east, a coalition of Arab tribal leaders went so far as to encourage Charlemagne to lay siege to Zaragoza in 778 (he withdrew when recalled to the Rhineland and from this episode emerged *The Song of Roland*). Any group that had established themselves in the provinces prior to 756 resented the Umayyad efforts at administrative and financial control.

However, through a relatively lengthy reign and with the prestige and legitimacy attached to the Umayyad name, ‘Abd al-Raḥmān I was able to slowly consolidate power in the province of Córdoba and at least keep most of the localized rebellions in check. As for the outlying provinces, if the provincial leaders were

willing to recognize his nominal right to rule and to send Córdoba a percentage of their taxes, ‘Abd al-Raḥmān I permitted them to continue in relative autonomy. He established an administrative and military structure similar to the one he had known in Damascus, and when news of his accession spread, Umayyad supporters throughout the Islamic world began coming to Spain, which increased his power base but further antagonized the earlier invaders, who resented having to share the spoils.

With so many internal concerns, ‘Abd al-Raḥmān I was unable to make much headway against the Christians in the north and failed to regain many of the towns lost to them under the governors. A border system of “marches” had been established to maintain the fluid frontiers with the Christians, but by the time ‘Abd al-Raḥmān I gained control internally, the marches had receded to the following positions: the eastern march became centered in Zaragoza, the central march in Toledo, and the western march in Badajoz. Berbers often occupied these unstable, agriculturally less-productive areas, and it was not until the reign of ‘Abd al-Raḥmān III in the early tenth century that these areas came firmly under Muslim control.

In the last two years of his reign ‘Abd al-Raḥmān I built, on the site of the Church of St. Vincent, the Great Mosque of Córdoba, which his successors expanded in stages and which still stands today. ‘Abd al-Raḥmān I died in 788 without a clearly designated successor. His son Hishām I, who had been ruling as governor of Mérida, declared himself emir two months later after defeating another of ‘Abd al-Raḥmān’s sons, Sulaymān.

‘ABD AL-RAḤMĀN II, EMIR OF CÓRDOBA

‘Abd al-Raḥmān II Ibn al-Ḥakam I was the great-grandson and namesake of the emir ‘Abd al-Raḥmān I, and ruled Muslim Spain from 822 to 852. ‘Abd al-Raḥmān II was born in 792 in Toledo and his father, al-Ḥakam I, clearly designated him successor before his own death. Like his predecessors, ‘Abd al-Raḥmān II had to face both internal and external threats to his power. His father had been quite heavy-handed in his reign, and ‘Abd al-Raḥmān II’s first challenges were to put down the subsequent and continuing internal rebellions.

One of ‘Abd al-Raḥmān II’s first steps was to give more official support to Islam—for example, he executed the chief of the palace guard, who was a Christian, and began building several mosques in Córdoba. The cooperation and legitimation provided by the Muslim scholarly class was essential to maintaining power in the capital. ‘Abd al-Raḥmān II’s next concern was to regain control in the Levantine territories and in Toledo. Other sources of internal rebellion were the muwallads (converts to Islam) and the Berbers (Muslim converts from North Africa). In the Ebro valley the muwallad Banū Qasī family regularly rebelled against ‘Abd al-Raḥmān II’s central authority. In Mérida, the Berber leader Maḥmūd Ibn ‘Abd al-Djabbār revolted. By the end of his reign, ‘Abd al-Raḥmān II succeeded in placing Umayyad-loyal governors in the three frontier capitals of Mérida, Toledo, and Zaragoza.

What has come to be known as the “Córdoba martyrs movement” began in 850 and finally came to a close with the death of the priest Eulogius in 869. Eulogius was chronicler of the movement, along with Paulus Alvarus, and their Latin accounts are the only sources available. This movement involved the voluntary martyrdoms of Christians who, distressed at the increasing cultural, linguistic, and religious weakness of the Christian community, publicly denounced Islam and the prophet Muḥammad, a crime punishable by death. For the most part these men and women came from monasteries on the outskirts of Córdoba, but some were offspring of religiously mixed (one parent Muslim, the other Christian) families in the city. The martyrs’ deaths did not stem the tide of Islamization that continued well into the tenth century; rather, they caused increased tension between the Christians and Muslims and within the Christian community itself.

On a somewhat irregular basis ‘Abd al-Raḥmān II sent summer military expeditions to fight the Christians in the north, particularly in the eastern march region of Asturias-León. The primary purpose does not seem to be the conquest of territory; the collection of booty, the punishment of impertinent Christian and Muslim vassals, the legitimation of the emir’s role as defender of the faith and thus his right to rule, and the chance to conduct military exercises appear to be the reasons for such expeditions. In 844 ‘Abd al-Raḥmān II faced a very real external threat in the form of Norsemen who landed at Lisbon and followed the Guadalquivir River all the way to Seville, which they sacked. ‘Abd al-Raḥmān II did rally to recapture Seville and drove the Norsemen out in the same year, but the threat always remained. As a result, ‘Abd al-Raḥmān II reinforced the navy and built shipyards at Seville and a naval base at Almería.

‘Abd al-Raḥmān II was the first ruler of al-Andalus strong enough to pursue wide-ranging diplomacy. He maintained ties with several coastal kingdoms in Morocco but shunned the Aghlabids of Qayrawān, who were loyal to the ‘Abbasids of Baghdad. He opened diplomatic relations with Byzantium and received an embassy from Theophilus; in return, ‘Abd al-Raḥmān II sent a delegation to Constantinople headed by the poet Ghazāl.

Known to be a great poet himself, ‘Abd al-Raḥmān II was a patron of arts and letters and brought learned men from all over the Islamic world to Córdoba. One of these, Ziryāb, was a renowned musician and singer from Baghdad who also knew astronomy and geography. The increasingly large and cosmopolitan population of Córdoba was developing a taste for luxury and ostentation under the prosperous reign of ‘Abd al-Raḥmān II, and Ziryāb quickly became the dictator of fashion and culture along ‘Abbasid lines. Ziryāb apparently introduced a new hairstyle; the vegetable asparagus; and the use of underarm deodorant, among other things.

‘Abd al-Raḥmān II was also known as a great builder and organizer. With the increase in the population of Córdoba, he enlarged the Great Mosque twice, in 833 and 848. He built many public works in Córdoba, but like virtually all his Umayyad predecessors and successors, did little of such things outside Córdoba. Following the ‘Abbasid administrative style, the focus was on the capital, with the various provinces enjoying a large measure of autonomy.

‘Abd al-Raḥmān II died in Córdoba in 852 and was succeeded by his son, Muḥammad I.

‘ABD AL-RAḤMĀN III, CALIPH OF CÓRDOBA

‘Abd al-Raḥmān Ibn Muḥammad was the grandson and successor of the emir ‘Abd Allāh and was known as ‘Abd al-Raḥmān III. He ruled al-Andalus from 912 to 966 and achieved a measure of prosperity and success unparalleled by those who came before or after him.

‘Abd al-Raḥmān III was born in 891. It is said that he had blue eyes and fair hair because of his Christian grandmother from Pamplona, and that he dyed that fair

hair black to better fit the physical ideal of an Arab Muslim ruler. Although he was relatively young when he succeeded his grandfather, ‘Abd al-Raḥmān III was already well-known at court for his intelligence, political common sense, and leadership abilities. He came to power at a time when the control of the Umayyad emirs did not extend much beyond Córdoba. When his reign ended almost fifty years later, ‘Abd al-Raḥmān III could count on allegiance from Toledo on the north to Ceuta in the south; he received annual tribute payments from the Christian kingdoms to the north; and he regularly welcomed embassies from Constantinople, Baghdad, and beyond.

The first thing ‘Abd al-Raḥmān III did when he came to the throne in 912 was to systematically consolidate power within al-Andalus and quell the internal revolts. The most pressing and long lasting of these was led by the muwallad rebel Ibn Hafṣūn in Bobastro, a mountain fortress outside Córdoba, where he had been ruling virtually autonomously since 888. ‘Abd al-Raḥmān III put pressure on Ibn Hafṣūn until his death in 917, and after him on his sons until they surrendered in 928. The emir attacked the rebel provincial leaders of large cities like Seville, Badajoz, and Toledo, laying siege for years if necessary. Once a city or castle capitulated, ‘Abd al-Raḥmān III either left his own deputy in charge or demolished the fortifications. He acted consistently and powerfully, but also shrewdly: if the rebel leaders submitted to his authority, he often appointed them as Umayyad military leaders in regions far from their own. In this way, by the year 933, ‘Abd al-Raḥmān III had achieved the full unification of al-Andalus.

The second task ‘Abd al-Raḥmān III set for himself involved securing the borders against the increasingly powerful Christian kings to the north. This he pursued simultaneously with his efforts at internal control: his summer campaigns (*ṣāi’fa*) to secure Andalusian allegiance all included forays and shows of force deep into the territory of the Christians. ‘Abd al-Raḥmān III led campaigns in 920 and 924 against the Basques and Leonese—not necessarily to conquer new territory, but to demonstrate his power to both Muslims and non-Muslims. In 920 he stopped the advance of Ordoño III of Asturias-León at the Battle of Junquera. In 924, to revenge the raids made by Sancho García of Navarre, he sacked and burned Pamplona. This was the farthest north he ever ventured. The only significant defeat ‘Abd al-Raḥmān III suffered was in 939 at the hands of Ramiro II of León at the Battle of Alhandega (in Arabic, *al-khandāq*, or “the trench”) near Simancas. This defeat was apparently due to resentment within the Muslim army toward ‘Abd al-Raḥmān III’s increasing appointment of foreign slave soldiers (*ṣaqāli-*

bah) to leadership positions and resentment of the rebellious Muslim vassals of the Upper March, who were forced to join the campaign. ‘Abd al-Raḥmān III never campaigned in the north again.

The third item on the political agenda of ‘Abd al-Raḥmān III was checking the progress of the Shiite Fāṭimids in North Africa. The Fāṭimids had come to power in 909 and built a new capital on the coast of Tunisia called al-Mahdīyya. From there Fāṭimid power spread west and soon threatened the coastal towns that faced al-Andalus. ‘Abd al-Raḥmān III responded by strengthening his own coastal fortifications and establishing bases on the Moroccan coast at Melilla (927), Ceuta (931), and Tangier (951). From there he forged alliances with Berber chiefs and continued to recruit Berbers into his army. A year after a Fāṭimid force from Sicily burned the Andalusian city of Almería in 955, the caliph built a new fleet. ‘Abd al-Raḥmān III’s position throughout this period was primarily defensive. When the Fāṭimids could make no further progress in the west, they turned east, and in 969 they conquered Egypt.

It was in the year 929 that the emir ‘Abd al-Raḥmān III declared himself caliph of al-Andalus, *amīr al-mu’mamīn* (Commander of the Faithful), and adopted the throne name al-Nāṣir (the Victorious One). It cannot be a coincidence that the declaration took place within a year of the conquest of Bobastro and defeat of the sons of Ibn Hafṣūn. Nor is it coincidental that the Fāṭimids, who were Shiites, had already proclaimed themselves caliphs in 909. ‘Abd al-Raḥmān III appears to have been persuaded that the decadence of the ‘Abbasid caliphs in Baghdad and their inability to defend the holy sites of Mecca and Medina disqualified them from the title, which he believed should be held by a Sunni Muslim leader. Calling himself a caliph was a way to enhance his power and prestige in and outside of al-Andalus. Al-Nāṣir quickly appropriated the two traditional symbols of caliphal power: he had his name invoked as caliph instead of the ‘Abbasid al-Qāhir during the Friday congregational prayers (*khutba*), and he began a new issue of coinage (*ṣikka*), including gold coins with his name and new titles.

Córdoba grew and flourished under the reign of ‘Abd al-Raḥmān III. He enlarged the Great Mosque and built a large, square minaret in the Syrian style. But his court and political administration increasingly imitated the ‘Abbasid and Persian styles, a process that had begun under the rule of his namesake, ‘Abd al-Raḥmān II. One of the things the Persian style entailed was increasing the distance between the ruler and his subjects. The building of a new palace complex on the foothills southwest of Córdoba was ‘Abd al-Raḥmān

III’s logical next step toward enhancing Umayyad prestige, further distancing himself physically and psychologically from his subjects along ‘Abbasid lines. He named the new palace Madīnat al-Zahrā after his favorite concubine, al-Zahrā. Construction began in 936 and continued throughout the reign of al-Ḥakam II. The complex contained a mosque, luxurious gardens, baths, housing for courtiers, a garrison for his personal guard, and an impressive audience hall. To impress and intimidate his visitors, ‘Abd al-Raḥmān III had a large bowl of mercury placed in the audience hall which could be made to cast lightning bolts across the ceiling. Although he was not particularly interested in the arts himself, ‘Abd al-Raḥmān III created a court at Madīnat al-Zahrā that attracted poets, scholars, and artisans from all over the Islamic world. Cosmopolitan Córdoba began to rival Constantinople in terms of population, and no other western European capital came close to Córdoba on any terms.

Another measure that contributed to the distance between the caliph and the people he ruled was ‘Abd al-Raḥmān III’s practice of importing slave soldiers (*ṣaqālibah*) from the north to staff the army and his palace guard. This is often cited as the source of resentment and division within the Umayyad forces that led to the debacle of Alhandega. But this was not a new practice—al-Ḥakam I had begun buying eastern European slaves from Jewish traders a hundred years earlier. What occurred during ‘Abd al-Raḥmān III’s reign was that the numbers of *ṣaqālibah* grew exponentially, as did their presence in military and political leadership positions. Ghalib, the general who fought the Fāṭimids for al-Nāṣir, was from their ranks and became al-Ḥakam II’s most trusted adviser. Many *ṣaqālibah* were castrated and served as officials of the harem, but others were not and established dynasties that within a few generations rivaled Arab and muwallad families for power and prestige. The Andalusian elite were understandably resentful, and the unification and loyalty ‘Abd al-Raḥmān III had worked so hard to achieve began to unravel.

But it took almost a century for things to completely come apart. ‘Abd al-Raḥmān III had begun with a splintered and anarchic state in 912 and within twenty-five years had forged unity, loyalty, and territorial integrity. He did this by going out on campaign himself, bringing rivals and discontents into his Córdoba circles, and cultivating loyalty to his person and dynasty. As his power grew, however, he began distancing himself from the people—he never went on a military campaign after 939 and in fact hardly left the Córdoba area; he spent increasing amounts of state revenue on displays of opulence and luxury; and, as mentioned above, he imported huge numbers of for-

eign soldiers. ‘Abd al-Raḥmān III died in 961 at Madīnat al-Zahrā, leaving his clearly designated successor, his son al-Ḥakam II, a strong and powerful state to rule but with the seeds of decline planted and growing.

ABNER OF BURGOS See VALLADOLID, ALFONSO DE

ABRAHAM BAR ḤIYYA (ḤAYYA)

Mathematician, astronomer, surveyor, philosopher, astrologer and translator Abraham bar Ḥiyya (ca. 1070–1136) lived in Barcelona. He was known by the honorific titles Ha-Nasi (Hebrew: “the prince”) and Savasorda (Latin corruption of the Arabic: *ṣāhib al-shurṭa*, “master of the guard”), which indicate that he held high offices in both the Jewish and the Catalan communities.

Nine works by him are known, all written in Hebrew. He was the first medieval author to write major philosophic and scientific works in Hebrew, and many of his *termina technica* are still used in modern Hebrew (e.g., *qeshet* = arc, *ma‘alah* = degree, *merkaz* = center, *shoq* = side of an isocles triangle). His works:

- (1) *Ḥibbur ha-meshihah ve-ha-tishboret* (*On Measuring*), a comprehensive introduction to surveying. Translated into Latin (1145?) by Plato of Tivoli, it played an important role in transmitting Arabic geometry and trigonometry to the West. Hebrew text, ed. M. Guttmann, 1912–13, Catalan translation, J. M. Millás Vallicrosa, 1931.
- (2) *Yesode ha-tebunah u-migdal ha-emunah* (*The Foundations of Reason and the Tower of Faith*), an encyclopedia of science; parts are lost. Hebrew text and Spanish translation, J. M. Millás Vallicrosa, 1952.
- (3) *Sod ha-‘ibbur* (*The Secret of Intercalation*), a study of the Hebrew calendar, written in 1123. Maimonides praised it as by far the best book on the subject (Commentary on Mishnah, ‘Arakhin 2:2). Hebrew text, ed. H. Filipowski, 1851.
- (4) *Megillat ha-megalleh* (*Scroll of the Revealer*), an eschatological and astrological work, written dur-

ing the 1120s. According to it, the messianic era might begin by 1136, and the resurrection would take place in 1448 or 1493. Hebrew text, ed. A. Poznanski, 1924; Catalan translation, J. M. Millás Vallicrosa, 1929.

- (5) *Epistle to Rabbi Judah ben Barzillai*, a defense of astrology, written ca. 1120. Abraham bar Ḥiyya had advised a student to delay his wedding for one hour in order to avoid the unpropitious influence of Mars. Judah ben Barzillai, the eminent talmudist, protested that such deference to astrology would amount to sorcery and idolatry. The wedding was not delayed, but Abraham wrote this epistle in defense of his view, arguing that astrological considerations are analogous to medical ones. Hebrew text, ed. A. Z. Schwarz, 1917.
- (6) *Hegyon ha-nefesh ha-‘ashubah* (*The Meditation of the Sad Soul*), a philosophic study of human nature, discussing the place of human beings in the creation, the good life, repentance (including an analysis of *Jonah*), and the future world. While often described as neo-Platonic, it also reflects Aristotelian, Kalamitic, and other influences. Hebrew text, ed. E. Freimann, 1860; G. Wigoder, 1971. English translation, G. Wigoder, 1969.
- (7) *Ṣurat ha-areṣ ve-tabnit ha-shamavim* (*The Form of the Earth and the Figure of the Heavens*), a work on cosmography, written in 1132; part 1 of *Ḥokhmat ha-ḥizzavon* (*Science of Astronomy*). Hebrew text, Basel 1546 (abridged), Offenbach 1720; Spanish translation, J. M. Millás Vallicrosa, 1956.
- (8) *Ḥeshbon mahalekhot ha-kokhabim* (*The Calculation of Astral Motions*), a textbook on Ptolemaic astronomy, written in 1136; part 2 of *Ḥokhmat ha-ḥizzavon*. Hebrew text and Spanish translation, J. M. Millás Vallicrosa, 1959; this edition includes Abraham bar Ḥiyya’s astronomical tables, *Luhot ha-Nasi* (*The Prince’s Tables*).

In addition, Abraham bar Ḥiyya was active in translating scientific works from Arabic into Latin, mostly in collaboration with Plato of Tivoli.

ABRAHAM EL-BARCHILON (AL-BARJILUNI)

A member of a prominent ancient Jewish family of Toledo, Abraham el-Barchilon (or, more correctly, al-Barjiluni) is undoubtedly identified with Abu Ishaq (*sic*) Ibn Abu'l-Hasan Binyamin in the Arabic documents of Mozarabic Toledo (1269, 1273, and 1294, the latter date by which he was already deceased).

He was *arrendador* (collector) of taxes for Sancho IV, who in June of 1287, following the advice of Don Lope Díaz, count of Haro, and of the *infante* Juan, placed Abraham in charge of all the taxes of the entire kingdom, including those of the Mesta. Like most Jewish officials, he was not a mere tax officer. For example, in August of 1287 he was with the king in Haro and signed (in Hebrew) a royal reprimand to the prior of a monastery, and later yet another to a monastery of Segovia; the following year he signed a letter to the cathedral of Burgos, and to that of Zamora. In 1292, as a result of the peace treaty between Jaime II and Sancho IV, Abraham and another Jew were mentioned as having been captured and held for ransom by Aragónese nobles, and Jaime II ordered their release.

From at least 1288 on he was in fact in charge of the royal chancellery, and thus it is no exaggeration that for at least two years he “administered almost the totality of the Castilian royal domain.” We last hear of him in 1294, as administrator of taxes together with Todros Abulafia.

ABRAVANEL, ISAAC

Isaac Abravanel (1437–1508) was one of the most important Jewish writers and statesmen of his age. His grandfather Samuel was already prominent in the reign of Juan I, and was *contador mayor* of Enrique III and treasurer of the queen. He converted to Christianity, however (long before the pogroms of 1491), before attaining these high posts, and took the name Juan Sánchez de Sevilla. Eventually, he determined to return

to Judaism, and in order to accomplish this had to flee to Portugal with some of his sons, while others remained as Christians in Castile. Isaac Abravanel thus grew up in Portugal, where he eventually became a wealthy merchant in Lisbon (together with his father), at least from 1463 on. Ultimately he became a confidant and financier of the Duke of Braganza (ca. 1480) and banker to the king of Portugal, Afonso V. The death of that king brought a change in attitude toward the Jews under his successor, and in 1483 Abravanel fled to Castile.

He was able to obtain a minor role as tax farmer, but in 1485 his position and influence increased greatly when he was placed in charge of all the taxes of Cardinal Pedro González de Mendoza, prelate of Spain and *canciller mayor* of the kingdom. Later, Abravanel became *contador mayor* of the powerful Íñigo López de Mendoza (it should be mentioned that the Mendoza family, many of whom were themselves of *converso* origin, were always intimately involved with Jews). He was able to make substantial loans to the Catholic Monarchs, and on one occasion (1491) acted as financial agent for the queen.

When the edict of expulsion of the Jews came in 1492, Abravanel apparently used his influence to annul or at least delay it, but to no avail. He chose to be among the minority of Jews who left the land, and like all the other exiles, he was permitted to collect outstanding debts and take with him money and personal property.

From Spain he went to Italy, where he again attained important political prominence, and where he did most of his writing. His son Judah (known as León Hebreo) was the author of the famous *Dialoghi d'amore*.

Never a rabbi, Abravanel was a deeply religious person, with a “fundamentalist” zeal for Jewish tradition. He wrote various treatises, including important commentaries on the Bible, all in Hebrew. In these, and even more in what may be called his “theological” treatises, he displayed his opposition to Aristotelian and Muslim philosophy, more than to Maimonides, whom he greatly revered while still disagreeing cautiously with some of his views. Contrary to the teachings, rather, of the more rationalist followers of Maimonides (Gerson and others), Abravanel believed literally in creation *ex nihilo*, and in a literal understanding of miracles. Though he showed himself ultimately opposed to any attempt to establish “fundamental principles” of faith in the Bible, since all of it is divine, these two ideas were bound up with his understanding of God as omnipotent. Unlike Maimonides, he believed that man is the “final cause,” or purpose, of the Creation, and that man’s purpose is the contem-

plation of God (perhaps under scholastic influence). Again unlike Maimonides, he was also a believer in astrology.

His political attitudes, while not systematic enough to be called (as they have been) a “political philosophy,” are of interest.

Abravanel played an important role in the messianic expectations of the generation of the exiles, and had a lasting influence on Jewish thought, and no less on later Christian thinkers.

It is believed that the *Panels of St. Vincent* of the Portuguese artist Nuño Gonçalves (ca. 1481) present an actual portrait of Abravanel, one of only two known portraits of a medieval Spanish Jew.

ABŪ ZAYD, GOVERNOR OF VALENCIA

Abū Zayd ‘Abd al-Rahmān, *sayyid* (Çeit Aboçeyt, to the Christians), was the great grandson of the caliph ‘Abd al-Mu’min, the founder of the Almohad caliphate. As *wālī* or governor of the Sharq al-Andalus (eastern Islamic Spain) during the general collapse of the Almohad empire in the early thirteenth century, he found himself effectively sovereign of the Valencian regions, or “king of Valencia” to the Christians, but challenged by the rise of the anti-Almohad Ibn Hūd. Allying first with Fernando III of Castile as “vassal” in 1225, in violation of the zones of reconquest agreements between Arago-Catalonia and Castile, and then with Jaime I of Arago-Catalonia in 1226, he lost his capital and kingdom to a local revolt by Zayyān Ibn Mardanīsh in 1229, falling back on the remnant Segorbe region. In desperation he had signaled the pope his willingness to convert and had conducted overtures with the cardinal legate Jean d’Abbeville in 1228. He had previously executed the Franciscan missionary “Martyrs of Teruel” at Valencia. A series of treaties with Jaime I in 1229, 1232, and 1236 progressively surrendered his income and sovereignty, until he became a puppet collaborator in the Christian conquest of the Valencian “kingdom.”

By 1236 he had converted, taking the name Vicente and the status of amply landed baron. He married the Aragónese lady María Ferrándiz, not Zurita’s Dominga López of Zaragoza, who gave him a son, Ferran Péreç (who died childless in 1262) and a daughter Alda Ferrándiz whose progeny became the Arenós noble dynasty. The number of his previous Muslim

sons and their conversions (perhaps four) is disputed, but Ibn Khaldūn testifies to Jaime’s patronage of his Muslim sons “on account of the conversion of their father.” Abū Zayd rarely used his baptismal name Vicente, and only late in life a noble surname, Belvis, keeping his attested conversion a secret for reasons of state from at least 1236 until 1264 when a bull of Pope Urban IV hailed the occasion. His latter years are identified with the military order of Santiago, of which he was a devout patron. Abū Zayd called himself King of Valencia in Latin documents until 1238, though Jaime I also took that title from 1236. His eagle seal survives, along with sufficient documentation both in Islamic and Christian sources to follow the trajectory of his full career. He died between 1264 and 1268; his body is entombed in the Franciscans’ Puritat convent at Valencia.

ABULAFIA, MEIR

Meir ben Todros ha-Levy Abulafia (ca. 1165–1244) was an important talmudic scholar and rabbi (though hardly “chief rabbi,” as sometimes claimed) of Castile, and a member of a distinguished family. His father, Todros ha-Nasi (“prince, leader”) was head of the Burgos Jewish community, and Meir’s brothers were also distinguished scholars. Todros, the son of Meir’s brother Joseph, was an important rabbi and cabalist of Toledo, and related to him was the renowned poet Todros ben Judah. Meir’s other brother, Samuel, produced a long line of descendants that included Samuel ha-Levy, the *tesorero mayor* of Pedro I. This family flourished at least to the end of the fourteenth century in Toledo.

Abulafia was a student of the renowned Moses ben Nahman (Nahmanides), and by 1204 he was already a member of an important Jewish court (*bet din*) in Toledo, together with Joseph Ibn Megash and Abraham ben Natan ha-Yarhi, two of the most important scholars of the age. We possess from his pen a number of legal responsa, as well as commentaries on portions of the Talmud. However, Abulafia is most famous (or infamous) for his crucial role in the “Maimonidean controversy.” Moses ben Maimon (Maimonides) had expressed certain ideas both in his legal code, *Mishneh Torah*, and in his earlier commentary on the *mishnah*,

which were concepts of Aristotelian rationalism and were viewed by the young rabbi as extremely dangerous to traditional Jewish views. He, as well as his colleague Abraham ha-Yarhi, correctly concluded that Maimonides did not accept the traditional Abulafia views about resurrection, for example. According to Maimonides, this is entirely allegorical and to be explained in accord with Aristotelian and Muslim philosophical interpretation. Abulafia penned a sharp critique of Maimonides, which he sent to rabbinical scholars in Provence. These scholars, however, sided completely with the great Maimonides and sharply rebuked the “young upstart” of Castile who dared to challenge his authority. He was similarly severely criticized by Sheshet Benvenist, lay leader of the Jewish community of Barcelona. Undaunted, Abulafia wrote a series of letters farther north, to the rabbis of France. Completely unfamiliar as they were with philosophy, much less with Maimonides’ views (which they little knew or understood), they took Abulafia’s side. Abulafia finally collected all this correspondence, which he issued with an Arabic introduction intended for Jewish readers in Andalucía. Although the controversy soon died down, it may well have resulted in the forged “Treatise on Resurrection” (*Ma’amar tehiyat ha-metim*) long attributed to Maimonides; as well, perhaps, as a treatise on this subject introduced into Abulafia’s commentary on Sanhedrin.

The Maimonidean controversy was to continue for centuries, along different lines. Abulafia’s importance today remains his responsa and talmudic commentary.

ABULAFIA, TODROS

Todros b. Judah ha-Levi Abulafia (1247–1298?) was a Hebrew poet who also served at the court of Alfonso X. Born in Toledo to an illustrious family of apparently modest means, Abulafia was steeped in Arabic and Romance cultures as well as in Jewish tradition. After being drawn into the entourage of a royal official named Solomon Ibn Sadoq, Todros traveled widely in Spain at the side of Ibn Sadoq’s son Isaac, singing his patron’s praises and otherwise entertaining him. Abulafia was apparently among the dignitaries swept

into prison in 1280–1281 during the second round of royal attacks upon Jewish economic and political influence at Alfonso X’s court. During his incarceration Abulafia’s literary tastes and cultural sensibilities seem to have undergone a radical transformation. The imprisoned poet appears to make amends for his hedonistic lifestyle and licentious behavior by producing a cycle of confessional poems in which he bemoans his fate and renounces his previously profligate ways. Following his release, Abulafia wandered in exile until he made his way to Barcelona, where he studied with that city’s leading sages and devoted himself to devotional verse and the poetry of spiritual love. In 1289 and for sometime thereafter, Abulafia served in the financial administration of Sancho IV and used his various offices to pursue lucrative business ventures.

Abulafia’s poetry freely combines the prosodic forms, manneristic tendencies, and genres characteristic of Andalusian Hebrew poetry with themes, motifs, and voices drawn from contemporary Romance. A large part of Abulafia’s *dīwān* (poetic corpus) consists of manneristic exercises and highly conventional poems designed to flatter the rich and famous.

Todros’s love poetry, by contrast, cultivates the persona of the dissolute poet in the tradition of Abū Nuwās and Ibn Quzmān; yet his poetry also shares the trend toward a more personal and “realistic” poetry evident in thirteenth-century Romance lyrics.

Abulafia seems to have composed little liturgical poetry, but his secular verse—especially the lyrics composed during and after his confinement—includes many poems in which the poet speaks directly to God about matters of personal significance. Although Abulafia is frequently referred to as a gifted epigone of the Andalusian school of Hebrew poets, an image the poet himself may have sought to cultivate, his poetry should be viewed as evidence of the vitality and innovative spirit of Hebrew poetry in Christian Spain.

ABULCASIS See ABŪ-L-QĀSIM

ABŪ-L-QĀSIM

Abū-l-Qāsim Khalaf ibn ‘Abbās al-Zahrq was well-known as Abulcasis in Latin translations (d. 1013). The *nisba* (nickname) al-Zahrq seems to refer to his

birthplace Madīnat al-Zahrq, the city-palace built by ‘Abd al-Rahmān III near Córdoba in 936 (a *terminus post quem* for his birthdate). No details about his life are known. His only extant work is the *al-Tarf li-man ‘ajiza ‘an al-taq-lif* (*How to Practice [Medicine] for Those Who Wish to Avoid the Use of [Other] Compilations*), written, after fifty years of medical practice, for his “sons” (probably his students). Divided into thirty books, it is the greatest medical encyclopedia ever written in al-Andalus. Although he had a thorough knowledge of both Greek and Eastern Arab medical works, the *Tarf* is often based on his own personal experience. Books 1–2 and 28 were translated into Latin via Hebrew and, the latter, dealing with pharmacology, was well-known in Europe under the title *Liber servitoris*. Book 30, on surgery, was translated in the twelfth century by Gerard of Cremona (*Liber Alsah-ravi de cirurgia*) and it established the reputation of Abulcasis as the greatest surgeon of the Middle Ages. It contains useful descriptions and drawings of surgical instruments, among which we find a vaginal speculum and an obstetric forceps that anticipates that of Chamberlen. We can read in the *Tarf* of one of the first known descriptions of hemophilia and leprosy, as well as new techniques for suturing including the use of catgut, and formulas for different kinds of plaster casings used to repair broken limbs.

ACUÑA, LUIS DE

Acuña was one of the most prominent personalities of ecclesiastic life in Burgos during the latter half of the fifteenth century. He belonged to a well-known noble family, not only as the son of Juan Alvarez Osorio and María Manuel, but also because of his family ties to Archbishop Alfonso Carrillo and to the marquis of Villena. After the death of his wife, Aldonza de Guzmán, he entered the clergy. He was the archdeacon of Valpuesta (Burgos) and bishop of Segovia, after which he acceded to the bishopric of Burgos in 1456. He participated actively in various political happenings of

the time: he helped organize Prince Alfonso's revolt against Enrique IV and also supported Juana la Beltraneja against the Catholic monarchs. Faced with Queen Isabel's arrival to the city, Acuña abandoned the diocese until a reconciliation was achieved. His leadership of the diocese was characterized by his active role in religious matters, often with intentions of reform. He attended the Council of Aranda in 1473 and the Synod of 1474.

Acuña was a notable patron of the arts during a period in which Burgos stood out as one of the most active hubs for accomplished artists such as Simón de Colonia and Gil de Siloé. During his term as bishop, the pinnacles of the cathedral towers were completed and construction on the chapel of the Condestables de Castilla was started. Acuña himself funded what would later be his funeral chapel, the Capilla de la Concepción, or Santa Ana, which he adorned with an exceptional tableau of the Tree of Jesse, made of multicolored wood by Gil de Siloé. Later, Acuña's tomb (sculpted by Diego de Siloé) was added to the chapel. Upon his death in 1495, Acuña left a fascinating library that attests to his humanist spirit.

ADELANTADO

First documented in the eleventh century, the term seems to have referred to an officer in charge of a frontier zone who also had judicial powers. As a royal office, the *adelantamiento mayor* was institutionalized no later than the reign of Alfonso X who, in royal charters of privilege, listed an *adelantado mayor* of the frontier (1253) and others to the same office in León, Castile, and Murcia (1258; at this time charters no longer list *merinos mayores* in Castile and Murcia). Early in 1261, contemporaneous with the war against Niebla, the *adelantamiento* of Andalusia was formed from the merger of Murcia and the frontier. Two years later Alfonso appointed an *adelantado mayor* in Galicia. Later (1268–1272), in circumstances most likely related to reaction against Alfonsine legislation, the *adelantados mayores* in León, Castile, and Galicia ceased to be listed; the merger in the south was dissolved; and only the *adelantamiento mayor* of Murcia and the newly created *adelantamiento* (*mayor* is not mentioned) in Alava and Guipúzcoa continued to ap-

pear during the final, troubled years of Alfonso's reign. Succeeding kings reestablished the lost *adelantamientos*, all of which continued to exist (some sporadically) through the rest of the Middle Ages. The Alfonsoine *Espéculo* describes two types of *adelantado mayor*: the one whose jurisdiction covered a major territory, and the one serving as chief justice of the royal tribunal, who judged certain types of cases and heard appeals from the decisions made in all inferior courts. Each *adelantado* was a lay *ricohombre* whose authority derived directly and exclusively from his royal appointment and whose powers, aside from specified limitations, were equivalent to those of the king.

The *adelantado mayor* of a kingdom or *tierra* administered justice conducive to the maintenance of law and order, at times exercising military and economic, especially financial, authority, and enjoying supreme judicial powers. The administration of justice especially gave rise to conflict with other authorities, notably with constituencies under foral law, until lines of jurisdiction became more finely drawn. Lords also named *adelantados*, analogous in function to those appointed by the king, in their respective spheres; a well-known ecclesiastical example is the *adelantado* named (1332) by the archbishop of Toledo to his fief of Cazorla (Jaén). Fernando and Isabel replaced the *adelantados mayores* of Castile, León, Andalusia, Murcia, and Granada with *alcaldes mayores*.

ADMINISTRATION, CENTRAL, ARAGÓN-CATALONIA

As one of most deeply acculturated sections of the Roman Empire, Spain retained the imprint of imperial government long after it was conquered by the Visigoths in the fifth century. To maintain control over the ruined Iberian political landscape, Visigothic kings adapted Roman political norms to their own rule. Though Toledo emerged as the core of the Visigothic kingdom, the administration that ruled Spain was less territorial than it was personal. With the influence of the Church through its councils, the Visigothic monarch seems in some ways only a first among equals. The center of this rule was the royal court (*aula regia*), comprised of the personal servants as well as the clerical and lay retainers of the king. The evolving nature of the Visigothic court and the administration that ema-

nated from it often transformed such servants into officials, and officials into servants. While the realm retained the bare outlines of the Roman provincial system, civil government of the periphery was entrusted to nobles who, bearing the titles of duke (*dux*) or count (*comes*), stood as guarantors of public peace and justice in their districts. Since their jurisdictions were far too large for one man to rule, these local governors delegated authority to a number of vicars (*vicarii*, *veguers*), who carried out much the same duties as their ducal or comital superiors but on a more local level. This loose mesh of regional and local government established an administrative blueprint followed with few emendations in all realms of Christian Spain until the twelfth century.

Despite its weaknesses, the Visigothic government was a centralized state in comparison with the tenuous political existence of the Christian realms of the Iberian Peninsula that came into being after the Muslim conquest in the eighth century. Along a ragged and ever-fluctuating frontier with Islam, Christian rulers were forced to think of military defense more than political dominance. As a result, landscapes as varied as Catalonia and León came to be covered with castles built by sovereigns and other great lords (*seniores*) and garrisoned by their vassals (*homines*, *milites*, *fideles*). In this regime of feudal relations royal power—and with it, royal administration—withered. The same fortresses, which stood as bulwarks against Islamic invasion, also blocked the full operation of royal government. Thus, judicial and fiscal functions once carried out by royal agents were now routinely, though intermittently, exercised by great lords (*principes*) and churchmen. With the disappearance of public structures of administration and adjudication, the Church fashioned such institutions as the peace and truce of God (*pax et treuga Dei*) to serve the public functions of the king and his officials. The *pax et treuga* formally came to Catalonia by 1027 and came to be utilized by civil ruler from 1064.

With the rebirth of central power in the eleventh century, the old Visigothic model of administration was adapted to the realities of the feudal world. With the reigns of Sancho III the Great, king of Navarre (1000–1035), and Ramón Berenguer I, count of Barcelona (1035–1076), the royal court (*curia regis*) and the comital court (*curia comitis*) reemerged as the center of an administration that grew more powerful, as did the office of sovereign itself. At the center of the *curia* was a corps of palatine servants that included the steward (*majordomo*), seneschal (*senescalus*), chamberlain (*cubicularii*), constable (*comes stabuli*), standard-bearer (*armiger*, *alférez*), butler (*botellerius*, *repostero*), treasurer (*thesaurarius*), cupbearer (*scanti-*

arius), carver (*taliator*), and schoolmaster (*caput schole, doctor*). Besides these servitors, a number of curial officials carried out regnal administration. The most important of these were the scribes (*scriptores, notarii*) and the judge of the palace (*judex palatii*). Owing to the decentralized nature of eastern Spain, territorial administration had to be shared with great lords in Aragón and counts in Catalonia who maintained their own courts and were served by their own officials. While eleventh- and twelfth-century sovereigns used such palatine officials as the seneschal and steward to administer their realms, they also depended on such agents as the *merino* and *sayón* in Aragón and the vicar in Catalonia to judge local suits, carry out judicial verdicts, collect taxes, and summon the royal host. In addition to such salaried royal officials, Catalan and Aragónese clergy were used as judges, overseers, and administrators. With the growth of towns in eastern Spain, the same hybrid clerical and lay administration shared power within urban limits with emerging municipal councils (*universitates*).

With the marriage of Ramón Berenguer IV to Petronella in 1137, the realms of Catalonia and Aragón were linked under the same ruler. Such an event could not help but complicate the administration of two states. With two different peoples to serve and three different languages to deal with—Latin, Aragónese, and Catalan—the chancery was divided into two departments, one serving the government of Aragón and the other the government of Catalonia. Though some calligraphical differences remained between the documents that emanated from the two divisions, these began to fade in the thirteenth century as the Catalan style attained dominance when the notarial organization came under the supervision of a single head, the chancellor (*cancellarius, canceller*). The birth of the Crown of Aragón (*Corona de Aragón*)—as the new federated state came to be called—was accompanied by other administrative changes, most especially in the training and status of the men entering royal service. Far from being drawn only from the region's monasteries and cathedral canons, royal administration from the twelfth century onward also began to attract laymen. Many of this new class of officials had received training in the two laws, Roman and canon, in such universities as Bologna and Montpellier. With this background in mind, it is not unusual that the officialdom of Ramón Berenguer IV and his son Alfonso II (1162–1196) became proponents of a regalist philosophy that sought to extend the crown's power at the expense of feudal privilege. One of the great curials of this era was Renallus, a poet, historian, and theologian who served as

the head of the Catalan-Aragónese chancery in the mid-twelfth century. Significant juridical outgrowths of the activist administrative philosophy in eastern Spanish administration were the Catalan legal compilations of the last half of the twelfth century, the *Usatges de Barchinona* and *Liber Feudorum Maior*.

With the long and eventful reign of Jaime I (1213–1276), the old forms of Aragónese and Catalan administration were tested, and this largely redefined the pretension of expanded royal power. Older classes of officials, such as the Catalan vicar, still held sway in their traditional jurisdictional units, but as Jaime I expanded political control over his older realms and conquered new ones, he increasingly used old bureaucrats in novel ways. The vicar was thus given an expanded role in carrying out the statutes of the peace and truce, a legal norm that Jaime I and his predecessors used as the base for all legitimate royal legislation. Unlike the vicars of the twelfth century, those of the thirteenth often worked in partnership with “peacekeepers” (*paciarii*) from the town councils who acted as guarantors of public tranquillity as well as municipal rulers. Locked in a life-and-death struggle with his baronies, the sovereign increasingly found the old functionaries ineffective in extending his power over the great men. To counter baronial interference in Aragón, the king established such new officers as the *sobrejuntero* and *justicia*. The first began as liaison with the defensive leagues (*juntas*) of the Aragónese towns but eventually became a governor of a district centered on one of the realm's largest towns. The second began as an urban judge but also attained a broader official mandate.

Jaime I took an even bolder step in administrative reshuffling by asserting more personal control over the bureaucracies of his realms. With the great conquests of Mallorca and Valencia (1229–1244), the Conqueror was away from his realms for long periods and increasingly relied on his son Pedro and the other crown princes as lieutenants (*locum tenentes*) who represented the crown in all official matters. Jaime I argued that he and his sons in their representative capacity were “one conjoint [royal] person.” In addition to this “family government,” Jaime I promoted bureaucratic loyalty by rewarding talent even when displayed by men of other faiths. The most important of these, the Jewish brothers Jehuda and Solomon de Cavallería, served as bailiff (*bailulus, batlle*) for much of Jaime I's later life. Under their tenure, the office became the centerpiece of a much more efficient management of royal lands and local revenues. This utilization of Jewish servitors avoided royal dependence on Christian nobles for administration and thus brought firm baro-

nial opposition. This dissent among the eastern Spanish baronies was deepened when Jaime I eschewed the use of nobles in most royal offices in favor of such professional advocates and jurists as Pere Albert in Catalonia and Vidal de Canyellas in Aragón, who left their Romanist mark on the important legislation of both realms.

To the nobilities of Aragón and Catalonia, Jaime I's administrative adaptations were dangerous "innovations" that had to be rolled back at all costs. In Catalonia, Roman law and lawyers learned in it were outlawed from court use on several occasions. In Aragón, the baronial revolt of the *Unión* (1265–1266) not only attacked the governmental changes that the king had put in place but attempted to co-opt them with the establishment of the *justicia mayor*—a "middle judge" who theoretically was to stand as an impartial mediator and justice between the crown and the Aragónese people. In time, this official was used by the Union to hamstring the expansion of royal government. During the reign of Jaime I's immediate predecessors down to that of his great-great-grandson Pedro IV (1336–1387), the Union increased its power at the expense of the crown by the establishment of a baronial council that oversaw royal domestic and foreign policies, using the Aragónese parliament (*Cortes*) to legitimize these private actions as national law. Even after the Union's demise in 1348, an expanded governmental role for the parliaments of both realms remained with the establishment of permanent agencies—the *Generalitat* in Catalonia and the *Diputación* in Aragón—that aided the sovereign in such matters as taxation and emergency military funding.

The trends of royal administration were altered in the sixty years after Jaime I by these waves of baronial unrest that attempted to redraw the official lines between ruler and ruled in a way reminiscent of the tenth and eleventh centuries. Nowhere was the Union's anachronistic view of royal power better expressed than in the spurious *Fuero de Sobrarbe*, which attempted to hem in not only the king but the royal administration with an impenetrable hedge of custom. With the reign of Jaime II (1291–1337), the crown began to reclaim power lost to the rebellious baronies of Aragón and Catalonia. Spending his youth as the sovereign of Sicily, Jaime II brought a more centralized view of administration to the Crown of Aragón. The supreme post in Jaime II's government, which had its roots in twelfth-century Sicily, was the *maestre racional*. This servitor, initially an overseer of palace accounts, emerged as the most important member in the eastern Spanish government, subsuming a number of the functions of the Aragónese steward and Catalan

bailiff in the process. Despite such bureaucratic importations, Jaime I did not destroy the offices of his predecessors but assigned to them a more restricted agenda. In one case, however, the king experimented with the older offices, creating an "overvicar" (*supravicar*, *sobreveguer*) to oversee blocks of Catalan vicarates. In regard to the chancery, Jaime II and his successors continued its development as a professional entity. A chancellor oversaw the operation and was assisted by a vice chancellor. The royal seals were maintained by the *protonotario* while the everyday functioning of the chancery came under the authority of a "manager" (*regente*) who was also responsible for document production and sealing as well as their reproduction in registers. All of the realms of the Crown of Aragón had similar chancery offices headed by a vice chancellor.

The most far-reaching trend that Jaime II continued was the use of his sons as procurators or lieutenants in his Iberian realms even when he was present in them. This office, which had originally been a temporary one, now became permanent, eventually overriding the bureaucratic dominance of the *maestre racional*. The office of procurator, which came to be called governor general (*gubernator general*) by the late fourteenth century, eventually came to be called viceroy (*virei*) in the fifteenth century. Though royal princes (*infantes*) initially held such lieutenancies, other family members, including queens, occasionally served in such posts. This power delegation was absolutely necessary during the reigns of such sovereigns as Alfonso V (1416–1458) who spent most of his life away from his Iberian realms in search of new Italian ones, routinely leaving Catalonia under the rule of his queen and lieutenant María of Castile. In the viceregal office of the crown of Aragón, then, we see one of the strands that would culminate in the sixteenth century with the office of viceroy. With the emergence of Spain as great international power, the viceroy would take his place at the head of an administration that would link places as distant as Sicily, the Netherlands, Mexico, and Peru to Madrid and its royal master. For eastern Spain, however, such power delegation had ominous overtones. It pointed forward to an era after 1516 when Aragón and Catalonia were not ruled by a native dynasty but instead received their government from Madrid. In the marriage to Castile, then, the old administrative ways of Catalonia were undermined and then discarded, eventually to be replaced with such foreign governmental norms as Felipe V's Decreto de Nueva Planta (1716). Catalonia would not regain even a measure of administrative autonomy until 1931 with the Catalan Statute. With Francisco Franco's victory in 1939, this short-lived freedom abruptly ceased, not to return until

the 1970s when Catalan home rule became one of the cornerstones of the new Spanish Republic.

ADMINISTRATION, CENTRAL, CASTILE

The central administration of Castile-León was based on the Visigothic court, which in turn was modeled on the Roman imperial court. A body of officials (*officium palatinum*) attended the Visigothic king on a daily basis. Several counts were responsible for the administration of the patrimony and the treasury, and the supervision of notaries, chamberlains, and the royal guard. Magnates (*seniores* or *maiores palatii*) specially commended to the king's service, together with bishops and territorial officials constituted a council (*aula regia*) assisting the king in executing his duties.

Emphasizing the continuity between the Visigothic and Asturian monarchies, Alfonso II (791–842) tried to restore in Oviedo the Visigothic order as it had once functioned at Toledo. Visigothic terms for the royal council reappeared. The chief officials were the standard-bearer (*armiger*), the *maiordomus* or superintendent of the household, the notary, treasurer, and chamberlains. The king occasionally gathered bishops, magnates, and palace officials in an extraordinary *concilium*, such as the council of León held by Alfonso V in 1017 to restore the kingdom after the destruction wrought by al-Manṣūr. In twelfth-century Castile and León the term *curia regis* came into use to designate the royal court or council, whether meeting in ordinary or extraordinary sessions. The duties of the standard-bearer, now called *alférez*, the *mayordomo*, and lesser officials remained essentially the same. Supervision of the royal writing office was assigned to the chancellor, ordinarily a cleric. The council advised the king in matters of legislation, justice, finance, diplomacy, and war. The king often stated that he acted “with the counsel of the chief men of my *curia*.” The great men of the realm participated in extraordinary sessions (*curia plena*, *curia generalis*, *curia solemnis*), as on the occasion of Alfonso VII's coronation as emperor of Spain at León in 1135. The curia of León held in 1188 by Alfonso IX was significant because he summoned to participate not only prelates and nobles but also the “elected citizens of each city.” That event heralded the future development of the *cortes*.

By the thirteenth century the business of government had become so complex that the responsibilities

of those daily attending the king were differentiated and administrative departments emerged. Legists (*letrados*) trained in Roman and canon law gave a professional cast to the court. Still there was no administrative capital, as the court continued to travel with the king. Alfonso X described the organization of the court (*corte*, *casa del rey*) in the *Siete Partidas*. The council (*consejo del rey*) was composed of clerics and laymen sworn to give good and loyal advice, to guard the king's secrets, and to obey his commands. The *alférez*, a noble of high rank, carried the king's standard and served as his advocate in matters of justice. Next in rank was the *mayordomo mayor*, a noble charged with oversight of the household and especially of financial accounts. The *almojarife* (usually a Jew) was responsible for collecting revenues and paying stipends to the nobility and to others. The admiral (*almirante de la mar*) was the commander of the fleet.

The chancery, composed mainly of clerics, handled much of the secretarial work, but the title of chancellor was now an honorific one shared by the archbishops of Toledo (for Castile) and Compostela (for León). The chief notaries (*notarios mayores*) of Castile, León, and Andalucía directed the scribes to draft documents, checked their form and content, ordered copies inscribed in registers, and seals of wax or lead to be affixed to the originals. Royal documents, ranging from the most solemn *privilegio rodado* to a simple mandate, now became more stereotyped.

An army of domestic servants, including chaplains and physicians, also accompanied the king. The chamberlain (*camarero mayor*) had custody of the bedchamber and the king's personal effects; the butler (*reposero mayor*) was in charge of service at table; the steward (*despensero mayor*) purchased food supplies and other necessities; the lodging master (*posadero mayor*) arranged suitable housing for the king and the court. The *portero mayor* directed heralds or ushers, who admitted visitors to the king's presence and served as messengers. The bodyguard (*caballero de la mesnada del rey*) completed the royal entourage.

This structure remained more or less intact until the Trastámaran era in the late fourteenth and fifteenth centuries. Then the main innovation was the clear separation of the royal household (*casa real*), whose responsibilities were essentially domestic, from the royal council (*consejo real*), the chancery, and the judicial tribunal. Every aspect of administration came within the purview of the council, which now became the principal organ of government. In response to the petitions of the *cortes* Juan I in 1385 created a council including four persons representing each of the three estates. The towns hoped that this would give them a permanent voice in the council, but the king quickly

replaced the municipal representatives with four legists who could be counted on to uphold royal authority. Thereafter membership constantly fluctuated. Perceiving that control of the council would ultimately mean greater power over all the instruments of government, the nobility strove to secure places in that body so that they could dominate it.

Fernando and Isabel transformed the council from a battleground of conflicting nobiliary factions into an instrument of the royal will, reorganizing it in 1480. The council now consisted of a prelate, three knights, and eight or nine legists. The royal secretary served as the intermediary between the ruler and the council and began to assume something of the character of a prime minister. As required, other specialized councils were created for the administration of the Military Orders (*Consejo de las Ordenes*, established in 1495), the Inquisition (*Consejo de la Suprema y General Inquisición*, 1483), and the Hermandad (*Consejo de la Santa Hermandad*), dissolved in 1498 after order had been restored to the kingdom. This medieval legacy underwent subsequent evolution and alteration as the needs of the modern era demanded.

ADMINISTRATION, CENTRAL, LEÓN

From the repopulation of the city of León by Ordoño I (850–866) to the incorporation of the kingdom of León into that of Castile on the death of Alfonso IX (1188–1230), the chief constant of its administration was the king in his *curia*. Throughout those four centuries kingship remained a peripatetic institution that brought its government to the various corners of the realm by visiting them periodically and personally. Its central method of operation was to bring the charisma of the crown to bear on political, religious, and judicial problems where they originated. Though the city of León itself always remained the *civitas regia* it was primarily a cult center in which the court took up residence for the celebration of the greatest feasts of the Christian and royal year, such as Christmas and Easter. It was in no sense a permanent administrative center.

The king never functioned simply by himself, but always with and in his *curia*, which was at once the essential advisory body and the executive instrument of the crown. Though no one individual or officer was

indispensable to the makeup of the curia except for the king himself, its constituent parts were fairly stable. First and foremost among them was the royal dynasty. That is, the prime advisers of the king were the other living adult members of the royal house, from queen mother, uncles, and aunts to sisters and younger brothers, the *infantes* or the generation to come, present in the court.

Second to the dynasts of the curia were the great churchmen of the realm. Usually that meant the bishop of León above all, closely followed by the bishops of Astorga and Zamora, who traveled with the court for long periods of the year. The bishops of Galicia, especially of Santiago de Compostela, became curial figures when the court was actually in Galicia itself but the very geography of the kingdom usually relegated them to minor participation. During the great period of union with Castile between 1037 and 1157, the bishops of Palencia, Burgos, and Toledo rivaled in importance even those of León proper. As the Reconquest of the twelfth and thirteenth centuries progressed, the bishops of Salamanca became curial figures, too.

The third constant element was composed of members of the great magnate families of the realm. These had not the institutional regularity or permanence of the episcopacy, and their identity at any given time is harder to specify. Nevertheless, some members of some such families were always present at court, though their composition would change from month to month. Ordinarily, those of the district through which the court was then progressing were most heavily represented.

A delicate and dynamic mix of the influence and advice of members of all three of these powerful groups lay behind every royal decision whether that latter had to do with matters dynastic, military, legislative, administrative, or judicial. Distinct organs to treat these areas had not evolved, and the curia dealt with all of them. In that work it was assisted by a number of officers of the crown who began to appear, as such, in the eleventh century although the functions themselves had doubtless existed earlier. We are not sufficiently informed as to the day-to-day functioning of the curia to determine in what measure they were actually regarded as members of it or simply as important royal servants. Probably such a distinction was not regularly made, for institutional categories were largely foreign to the age.

These offices were three. One was the *mayordomo*, responsible for the order and supply of the court on its travels and of its principal residences. A second was the *armiger*, or *alférez*, who was the commander of the royal bodyguard, the nucleus of the army, and the bearer of the royal standard in battle. The third was

the royal notary, called chancellor from the reign of Alfonso VII (1126–1157). The first two offices were held by nobles drawn from one or another of the great magnate families of the realm ordinarily and the relative frequency of the latter's appearances in them is a good gauge of their contemporary influence at court and in the kingdom. Since the third required literacy, it was held by ecclesiastics. From the reign of Fernando II (1157–1188) the chancellorship was titularly held by the archbishop of Santiago de Compostela but usually exercised through a delegate.

None of these offices were held for a fixed term, and there is no good evidence of a hierarchical staff to support them, except in the case of the chancellor, though all doubtless had assistants of some sort. In the case of the notary or chancellor we can see already in the reign of Alfonso VI (1065–1109) a function vested in a group of four or five clerics arranged in a rough hierarchy, some being known simply as *scriptor*, others *notarius*, and finally as chief officer or *cancellarius*. Also from the time of Alfonso VI there seemed to be a rough sort of *cursus honorum* that operated in relation to all three offices. Some clerics, at any rate, appear to have moved from *scriptor*, to *notarius*, and even to *cancellarius*, and then go on to appointment to an episcopal office. In the lay offices, some male children of the nobility seem to have been raised at court, as adults are entrusted first with the office of *alférez*, move on to become *mayordomus*, and subsequently appear as count in an area where their father or an uncle had preceded them.

At least from the time of Alfonso V (999–1028), the ordinary curia was purposely swollen from time to time for functions of special importance. These "general curias" to which people were especially summoned and to which contemporaries referred by a variety of terms, decided questions of royal succession, war, peace, and church reform. One such, summoned to León in April of 1188 by Alfonso IX to ratify his own succession, is the first known to have included representatives selected by some of the towns of the realm. Therefore, it is ordinarily thought of by modern historians as the first *cortes*—the first parliament in Iberia as well as in the medieval west. Burghers are known also to have been summoned to other, later curias of Alfonso IX but it would be too much to say that their attendance had already become customary.

ADMINISTRATION, CENTRAL, NAVARRE

It is only at the end of the medieval era that a real administration came about in the kingdom of Navarre. During the epochs of Sancho the Great (1005–1035), of the kings of "Aragón and Pamplona" (eleventh and twelfth centuries), and then of the last sovereigns of the native dynasty (the thirteenth century), one chancellor alone seemed sufficient to the whole of affairs, at the side of the king, head of his troops and master of his castles. As the kingdom became a real state such as the great neighboring kingdoms, Navarre asked for an administration and a specialized staff. The kings of the French dynasties have seen, in these appointments and this management, an element of their sovereignty; the political and economical necessities required it. The examination of this administration is therefore the most fruitful in the last centuries of the Middle Ages. The king had a palace and a court, from where everything was issued and everything ended up. The king of Navarre, like his contemporaries, only acted with the advice of a council. Within its ranks appeared the princes of the family and all those that the king wanted to summon according to his own will. On several occasions, as the kings of Navarre lived in France as much as in their kingdom, a governor replaced the king. In the thirteenth and fourteenth centuries the governors were French noblemen, treating Navarre as a bailiwick of the Capetian lands. But Charles II (1349–1387), definitively and truly setting down his kingdom, no longer appointed governors. His brother Louis, then his son Charles and also queen Jeanne, periodically replaced him, each bearing the title "king's lieutenant" (this was especially true of Louis, until 1361).

Beside this high officer, the members of the council were the Navarrese noblemen or the sovereign's personal secretaries whose social backgrounds were various. The chancellor of Navarre played one of the first parts, but he was not always appointed and could be replaced by the keeper of the seals or even by a college of solicitors and *alcaldes*—the judges of the court—who often took charge of the administration. But under Charles III (1387–1425), the chancellor Francés de Villaspesa was one of the greatest actors in the life of the kingdom. The chancellery's seal and the king's seal alternated in diplomatic acts, according to their object and according to their author.

Lastly, at the king's side, the palace sometimes grouped together several hundred people. To manage this king's house, this king's hotel, "masters" and

chambriers had officers, servants, equeries, and clerks, who were gathered in the departments of the stable, kitchen, *fruiterie*, *echansonnerie*, pound, *paneterie*, and chapel. Each department had its budget, each officer his wages.

The supplying of the court lay on the management of the province as the efficiency of the royal government. Since the thirteenth century the kingdom of Navarre was divided into *merindades* of the mountains, Estella, Sanguesa, the Ribera, and the Châtellenie of Saint-Jean for northern Navarre. Each county town of a merindad had its bayle, sitting in Pamplona, Estella, Sanguesa, Tudela, and Saint-Jean-Pied-de-Port. Divisions according to the valleys, walled towns, and enclaves still separated these merindades. Then, in the fifteenth century, the merindad of Olite was created. The *merinos* were the king's representatives, judges, and administrators, especially in charge of the castles (which had *alcaytes* filled by the king) and the raising of the troops; they were generally French noblemen, or Navarrese in the fourteenth and fifteenth centuries, often simultaneously holding duties in the court and in the council. At their side, a collector and a judge were indispensable experts.

Another way of controlling the province was to make it take part in the central government. Following the usual custom of occidental kingdoms, the king of Navarre convened representative meetings, the very Iberian *cortes*. Members of the clergy, nobility, and the delegates of the "good towns" therefore sat on the royal request, in order to grant fiscal aid and to support the great acts of politics (the raising of an army, the legal recognition of an heir to the throne). But the management of the merinos and of their tax collectors had to be controlled by investigators—reformers created by the French kings in imitation of the *Capetian's* investigators, who supervised the whole of judicial and fiscal life, and provincial as well as treasury officers.

Everything indeed ended up in a treasury. The general treasurer of the kingdom, a cleric or French or Navarrian bourgeois, supervised all the provincial collectors, domestic officers, and the military or miscellaneous expenses of the life of the state. Besides this very great official, a chamber of accounts was created in 1365. This was a special court that dissected all financial initiatives and expenses with clerks, solicitors, and auditors, most of the time Navarrese bourgeois. Finally, a court tribunal, entrusted to four *alcaldes* and four solicitors, a lawyer, an inland revenue prosecutor, and a crown prosecutor, represented a breeding ground of councillors and high-ranking officers and played both political and juridical roles. The staff of these administration charges, with its solidarity, its careers, its remunerations, its efficiency, and

also its abuse and faults, reflected the whole political life of the kings of Navarre.

ADMINISTRATION, CENTRAL, PORTUGAL

The central administration of the kingdom of Portugal was initially patterned on that of the neighboring kingdom of León-Castile, from which Portugal separated in the twelfth century. The *curia regis* consisted of prelates and nobles who counseled the king on major affairs and a body of functionaries who accompanied the king on his travels. The royal court at that time had no fixed residence, nor were the responsibilities of royal officials clearly differentiated. The principal officials were the *signifer* (later called *alferes-mor*), a high-ranking noble who bore the royal standard and commanded the king's armies. Next in rank was the *maiordomus curie* or *mordomo mor da corte* who supervised the affairs of the royal household and the public administration. Under Sancho II (1223–1248) the *mordomo* was known as the *maiorinus maior* (*meirinho mor*) of Portugal, but Afonso III (1248–1279) restored the older title. Assisting the *maiordomus* was the *dapifer curie*, but this office soon disappeared. A notarius or notary originally acted as a royal secretary, but Afonso I (1128–1185) established the office of chancellor. The *cancellarius* or *chanceler* was a cleric whose task was to draft and publish charters and diplomas and to guard the royal seal used to authenticate them, notaries and scribes assisted him. From the time of Afonso II (1211–1223) royal documents were recorded in registers for future reference. The office of *superiudex* (*sobrejuiz*) or superior judge was created by Sancho II to adjudicate litigation brought before the king.

From the time of Afonso III the central administration became more complex and required greater organization and differentiation of functions. Whereas Coimbra had been a favorite residence of his predecessors, Afonso III opted in favor of Lisbon, which was more centrally located. There the royal archives were deposited, but the chancellor and much of the rest of the court continued to accompany the king as he trav-

eled extensively about his realm. In 1258, Afonso III published a *Regimento da Casa Real* that described the duties of palatine officials. Besides the mordomo mor, the alteres mor, the chancellor, and the sobrejuiz there were numerous other officials whose functions were often of a private nature. They included the *reposteiro mor* or butler, the *porteiro mor* or chief usher and messenger, the chaplain, the royal physicians, and other subordinates. A royal council (*conselho d'el-rei*) composed of the mordomo mor, alferes mor, the chancellor, the sobrejuiz, and other counselors chosen by the king assumed a more permanent character and was consulted regularly by the king on matters of great importance.

After the conclusion of the Reconquest the chancellor assumed the dominant role in the court, supervising an ever-growing bureaucracy of clerks, notaries, scribes, and other professionals or legists educated in the universities in civil and canon law. The functions of diverse groups of officials now became more specialized. In the reign of Pedro I (1357–1367) the chancellor was gradually supplanted as the most influential person in the royal court by the *escrivão da puridade*, the king's private secretary, who used the king's personal seal (*anel de camafeu*) to handle business much more expeditiously than the cumbersome machinery of the chancery. Also playing a role of the utmost importance were the *livradores de desembargos* or deliverers of dispatches. These legists received petitions and requests for royal action; after reviewing them and determining how these matters should be handled, they presented their recommendations to the chancellor or to the king.

During this time as the administration of justice became more complex, requiring highly specialized knowledge, the royal tribunal was separated from other elements of the central administration. The sobrejuizes of earlier times were replaced by *ouvidores* or auditors, men usually trained in Roman and canon law, who constituted a tribunal or *audiência* to adjudicate suits in the king's name. Under Afonso IV (1325–1357) one group of auditors sat in a fixed place while another accompanied the king. This eventually gave way to the establishment of two principal royal courts. The Casa do Cível, settled first in Santarém and then in Lisbon by João I (1385–1433), was constituted by sobrejuizes and two *ouvidores do crime* to hear both civil and criminal cases. The two *ouvidores do civil* and two *ouvidores do crime* who formed the Casa da Justiça da Corte traveling with the king also dealt with civil and criminal matters. A third group of judges, the *vededores da fazenda*, handled litigation concerning the king's revenues and financial administration. The *cor-*

regedor da corte, exercising police functions, maintained order in the court.

Recognizing the importance of the royal council in the initiation and development of royal policy, the municipal procurators in the courts of 1385 hoped to secure permanent representation in the council along with prelates, nobles, and legists. In the fifteenth century the council consisted of twenty-seven members, divided into three groups each consisting of six councillors, a prelate, a noble, and a townsman, chosen every three years; each group would serve for four months. While service in this body was largely honorific, the chancellor, the *escrivão da puridade*, another royal secretary (*secretario d'el-rei*), two *corregedores da corte*, and the *meirinho mor* overseeing the administration of justice in noble estates constituted a small council that met regularly to advise the king.

ADMINISTRATION, FINANCIAL, CROWN OF ARAGÓN

The resources available to the kings of Aragón depended upon a wide array of patrimonial assets, customary exactions, and subsidies that varied in importance according to historical circumstances and regional tradition. Each component of the dynastic federation known as the Crown of Aragón possessed fiscal assets and prerogatives providing the ruler with support but also limiting his prerogatives. In the upland kingdom of Aragón and the counties of Old Catalonia, the foundation stones of the dynastic confederation, rulers originally lived and governed from their domain and traditional fiscal exactions. The impulse for new territorial conquests in al-Andalus and ambitions in the Mediterranean created heavy new demands that outstripped traditional resources by the late twelfth century. As a result, the early count-kings instituted fiscal initiatives to improve the management and collection of their older resources and turned to new forms of taxation. The forcible addition of the new realms of Valencia, Mallorca, and Sicily in the thirteenth century and the later conquests of Sardinia and the kingdom of Naples each presented new challenges to fiscal control, not to mention the heavy expense of maintaining such far-flung interests. New forms of central financial control were instituted, but the monarchy also had to

recognize the financial and political concerns of the individual regional components. The tensions between central and local fiscal supervision, delegated and direct fiscal management, and traditional and novel forms of revenue created the dynamic behind the administrative and political actions of the kings of Aragón.

Early Fiscal Initiatives

The surviving fiscal accounts in Catalonia, whose administrative records are far fuller than those of Aragón, provide a window on the nature of early fiscal supervision. From the mid-twelfth century the records of account demonstrate that scribes and clerks provided a literate professionalism essential to the development of government. While vicars and bailiffs, the local agents in charge of the fisc, no doubt had traditionally been subject to irregular review, the spread of militant lordship in Catalonia from the early eleventh century had made the count's men look upon their charges as patrimonial assets rather than as delegated responsibilities. To rein in his officials and gain firmer control of his assets, Ramón Berenguer IV commanded an ambitious survey of comital domains, executed by Ramón de Caldes and Guillem de Bassa in 1151. Although a traditional form of memorializing assets, the "Little Domesday" for Catalonia provided a basis for erecting a more ambitious structure of fiscal control. Under Ramón Berenguer IV's successor, Alfonso I (Alfonso II of Aragón, 1162–1196), court accountants began to update inventories and supervise periodic fiscal reviews of officials. Copies of audits were kept in a new fiscal archive and professional literacy began to overshadow personal loyalty as the foundation of patrimonial control. Because of growing indebtedness in the later years of Alfonso I and especially during the reign of his son, Pedro I (1196–1213), the assignation of revenues from bailiwicks and vicariates as pledges to meet financial demands became increasingly common. Credit long remained a critical feature of local Catalan administration. Royal finance was still dependent on supervision by courtiers, without budget or treasury. One must not overemphasize the effectiveness of these reforms, but they did point the way to firmer fiscal control. A handful of accountants and scribes helped organize and supervise local financial administration, but firm central institutions were still lacking.

Expanded political ambitions in the thirteenth century severally strained traditional sources of revenue. King Pedro I incurred massive debts to barons and court financiers; his death at the Battle of Muret provoked a financial crisis during the early years of his

son Jaime I (1213–1276). Large parts of the royal domain were given over to barons in order to recover their loans, but under the financial supervision of the Knights Templar, the crown gradually regained direct administration of its domains. The conquests of Mallorca (1229) and Valencia (1238) provided important new sources of revenues that offered immediate relief for the financial pressures on the old heartlands of Catalonia and Aragón, yet other sources of revenue would also be required to support even more ambitious military and political designs. Close supervision of commercial tolls and urban utilities provided important supplements to traditional patrimonial assets as towns grew. In addition, King Jaime I asked for more tallages from individual cities and regions, imposed taxes on Jewish communities, exploited the newly subjected Muslim communities in Valencia, and requested general levies. In Catalonia, the *bovatge*, distantly related to a peace tax in Cerdanya, was levied throughout the land in 1173. Although it became a customary accession tax, thirteenth-century kings came to impose it in emergencies. In Aragón, a tax levied for the redemption of the coinage, the *monedatge*, served a similar function. Territorially based and levied by paid collectors, the *bovatge* and *monedatge* became the first public subsidies in the Crown of Aragón and prompted the kings to ask the *cortes* (general assemblies) for the aid.

The reign of Jaime I was marked by growing institutional maturity and expanding bureaucracies. Bailiffs continued to supervise fiscal administration locally in Catalonia and Valencia while *merinos* served the same function in Aragón, only both increasingly employed subordinates or farmed out parts of their charge to investor-administrators. Substantial elements of older patrimonial assets were assigned to creditors, whose advances were critical in keeping local administration running smoothly. The kings kept tighter control of their rights in their newly conquered territories of Valencia and the Balearic Islands. Until the 1280s Jews served frequently in the principal urban bailiwicks, and major parts of the domain were pledged to barons and urban financiers. Fiscal supervision, once charged to the Templars, became connected with the chancery, for the early royal registers, dating from the 1250s, contain accounts and audits. Because of baronial revolts and the conquest of Sicily in 1282, the later years of Jaime I and the reign of his son Pedro II (III of Aragón, 1276–1285) were again marked by mounting financial pressure. To help organize his scattered assets for urgent military needs, in 1283 Pedro II experimented with a new, centralized fiscal supervisor for the Crown of Aragón, the *mestre racional*.

Central Fiscal Control (1283–1419)

The creation of the *mestre racional* was part of a general movement toward administrative specialization and maturation throughout the Crown of Aragón. Mediterranean conquests and the political repercussions they brought strained the financial resources of the Aragónese kings as a long series of confrontations with France, Castile, Genoa, and Naples, as well as the difficulty of subduing Sardinia, required substantial military and naval expenditures throughout the fourteenth century. To meet these demands, the monarchy needed to tap its widely dispersed resources and turn to new forms of revenue. As the fiscal overseer of accounts throughout the Crown of Aragón, the *mestre racional* became the principal fiscal official with responsibility over the federation.

Pedro II instituted the office after a Sicilian model in 1283, the year after the Catalan conquest of the island. At first, the *mestre racional* served with three other court officials to supervise accounts from the realms directly subject to the king of Aragón with the exception of Sicily, where the office originated. Without clearly circumscribed functions among his three peers, the *mestre racional* was not able to consolidate his position at first and encountered opposition from local administrators, particularly in Aragón. The office was briefly abolished from 1288 to 1293. Jaime II (1291–1326), however, reinstituted it and now gave the supervision of fiscal audit to the *mestre racional* alone, assisted by his scribes and a lieutenant. Later administrative ordinances in 1344 and 1358 further clarified and strengthened the nature of the office. The *mestre racional* oversaw a complex network of fiscal administrators and creditors to the crown. He received and audited accounts from the three general bailiffs, instituted in 1282 in Catalonia, Aragón, and Valencia to supervise local vicars, bailiffs, and merinos. Accounts kept by royal creditors, collectors of extraordinary revenues, and members of the royal family also fell under his jurisdiction. With increased central control of finance, the king could now total and compare revenues from various peninsular realms in order to determine the degree to which his resources could support his policies.

Besides the *mestre racional* and his assistants, two other officials also participated in central financial administration: the treasurer and the *escrivá de ració*, with attendant scribes. The treasurer was of course responsible for the receipts and disbursements from the royal treasury, which remained itinerant. Associated with the treasurer was the *escrivá de ració*, who dealt with the royal household, including jewelry, clothing, and other valuables, and occasionally with royal am-

bassadors or procurators. The central financial administration thus involved fifteen or twenty individuals, with the *mestre racional* at its summit.

The centralization and stability of fiscal audit produced a splendid series of financial records from the end of the thirteenth century. Together with the accounts of the general bailiffs in Aragón, Catalonia, and Valencia, the records kept by the *mestre racional* provide a detailed account of the state of finance throughout the Crown of Aragón, with the exception of the kingdoms of Sicily and Mallorca (which had its own *mestre racional* during its period of independence). These records reveal a substantial growth in the revenues available to the king since the early thirteenth century. The increases, however, came principally from commercial tolls and extraordinary taxation rather than from the older lands and revenues of the fisc. These traditional sources of income had been assigned to meet the expenses of local administration and debt or alienated either for long periods or in perpetuity. In the early fourteenth century only 10 percent of income that came from the traditional royal patrimony in Catalonia made its way into the coffers of the treasurer, and the state of the fisc was surely little better in Aragón. King Jaime II already complained that debt was forcing him to alienate parts of the royal patrimony, and the problem worsened during the second half of the fourteenth century. Owing to the erosion of the fisc, Martín I (1396–1410) attempted to recover portions of the lost patrimony and further alienations were prohibited. In Catalonia, royal officials concentrated on the recovery of jurisdictional rights, while in Aragón the cortes were in charge of recovering royal rents. Although not completely successful, these reforms did help slow the hemorrhaging of traditional sources of revenue and rights to the crown. The attempts at recuperation, however, above all demonstrate the financial difficulties facing the monarchy in the fourteenth century and the need to look for new sources of revenue.

Although the kings of Aragón had sought and received general levies such as the *monedatge* and *bovatge* as well as local tallages from the twelfth century onward, customary limitations on their assessment did not allow these revenues to meet the expenses of the crown. In the early fourteenth century, nondomainal revenues constituted the lion's share of income to the royal treasury. Regular tribute and irregular subsidies demanded from Mudéjar and especially Jewish communities grew in importance. In the treasury receipts of 1335, for which one of the few detailed studies exists, Jews contributed 21 percent of the total; the *aljamas* of Catalonia paid almost twice as much as those of Aragón. In the same year 58 percent of income to

the crown came from irregular subsidies, of which only 4 percent derived from the traditional sources of *talage*, *monedatge*, and *bovatge*. In that year the primary source of income to the crown as a whole came from an *imposició* (subsidy) voted by the *cortes* of Valencia. In Catalonia and Aragón as well irregular aids and impositions granted by the *cortes* of the individual realms provided important new means of war subsidies that far exceeded renders from customary domains and revenues. With larger and increasingly regular subsidies came greater demands on the part of representative bodies for fiscal supervision. Permanent standing deputations of the *cortes* in the three realms supervised and audited the collectors of the revenues they approved. The autonomous powers of the Diputación del General in Aragón, Catalonia (where it was called the Generalitat), and Valencia, each a permanent commission voted by their respective *cortes*, were fully recognized by the early fifteenth century. As representative institutions consolidated their power and provided substantial revenues to supplement the income from the royal domain, regional concerns in each of the three realms heightened the practical difficulties of managing financial affairs centrally.

By the turn of the fifteenth century Valencia, jealous of Catalan domination of the federation, had attained a new financial and economic importance. In addition, the installation in 1412 of a new dynasty the Trastámaras, had come at the price of strengthening the constitutional prerogatives of each of the realms. These new circumstances induced Alfonso IV (Alfonso V in Aragón), who would spend most of his long reign in southern Italy, to establish a separate *mestre racional* in Valencia in 1419.

Debt, Regionalism, and Reform (1419–1516)

With the foundation of separate *mestres racionales*, the treasury remained the only central financial institution after 1419. Yet the movement toward decentralization also eroded the traditional responsibilities of the office. From the 1420s onward the general bailiffs in each realm and local bailiffs and merinos authorized expenditures directly from the revenues they collected without receiving specific letters of payment from the general treasurer. As a result, specialized local treasuries formed and kept separate registers of account. The general treasurer's receipts therefore no longer reflected the balance of income from throughout the crown since large portions of patrimonial revenues and expenditure were handled at a local or regional level. His duties became limited to supervising the reduced amounts that actually arrived at the coffers traveling with the king.

During the fifteenth century the kings of Aragón continued to face the same financial difficulties that had plagued their predecessors in the fourteenth. We still know little about the effects that heavy military expenditure had on the royal fisc and local officials. The majority of revenues from traditional patrimonial resources continued to be consumed in local administration, and parts of the fisc were pledged to meet expenses. Owing to the persecution of Jews and declining number of Mudéjars, taxes from religious minorities declined. Contributions to the king administered by the diputaciones of the three regional *cortes*, however, continued to be substantial, as did subsidies and loans from the towns. In Catalonia, private banks also provided substantial amounts. Unable to meet the immediate demands of their sovereign from their ordinary revenues, the diputaciones and towns came to rely on the sale of annual and life annuities (*censals* and *violaris*) to investors, secured upon their taxes and other rights. The amount of public debt grew substantially in Aragón and Valencia during the fifteenth century, but the crisis was deepest in Catalonia, which was wracked by civil war and economic hardship from 1462 to 1472. The advent of Fernando I in 1474 marked an important turning point in the financial well-being of the Crown of Aragón for he set out with urgency and determination to reduce public debt, decrease the interest paid on annuities, and recover alienated portions of the royal patrimony. His reign witnessed an amelioration in the finances of the Crown of Aragón, but the amounts his territories could provide seemed meager in comparison to the resources Isabel possessed in the expansive Crown of Castile.

ADMINISTRATION, FINANCIAL, CASTILE

The rudiments of the financial administration of the Roman Empire survived in the Visigothic era. Recesvinth, at the Eighth Council of Toledo in 653, confirmed the distinction between state property and the personal holdings of the king, which were transmissible to his heirs. Nevertheless, the distinction between

public property and the private estates of the king tended to blur very easily. Officials such as the count of the patrimony and the count of the treasury appear to have had responsibility for the royal domain and revenues and expenditures. Revenues, including a land tax, poll tax, tolls, and fines, tended to be customary and of fixed amounts and were collected by local officials.

The data for the kingdoms of Asturias-León-Castile prior to the thirteenth century is so scant as to make it difficult to speak of financial administration. The distinction between public and royal property disappeared altogether. No attempt at a budget seems to have been made, and revenues, whatever their source, were used by the king as he saw fit. The *maiordomus* apparently took charge of the collection and expenditure of royal revenues, while the treasurer (*thesaurarius*) guarded the king's jewels and other valuables. Local officials (*merinos*) were responsible for the collection of tributes and other moneys owed to the king. Royal revenue continued to be derived from the tribute payable by tenants on the land, labor services, tolls, fines, hospitality, and transportation.

As royal needs and responsibilities became more complex in the thirteenth century so did the financial administration. The *mayordomo mayor* had general charge of the king's accounts, but the *almojarife mayor*, often a Jew, directed the collection of taxes and the payment of stipends to the nobility, one of the major expenses of the crown. Ordinarily the king contracted with tax farmers who were authorized to collect specific taxes in return for payment of a fixed amount into the treasury every year; for example, in 1276–1277 several Jewish tax farmers contracted to pay 1,670,000 *maravedís* from the collection of taxes due since 1261. In 1280 Alfonso X executed Zag de la Maleha, the *almojarife mayor*, for diverting funds already collected to the king's son, Sancho. The *cortes* (parliament) often demanded that only Christians should be permitted to collect taxes, to the exclusion of Jews, nobles, and clerics. Tax collectors (*merinos*, *cogedores*) were required to render accounts annually; among the few records still extant are accounts for several years in the reign of Sancho IV (1284–1295). From time to time the *cortes* demanded an accounting of royal income and expenditures; an audit carried out at Burgos in 1308 revealed a deficit of 4,500,000 *maravedís*. Fernando IV promised the *cortes* in 1312 that he would balance the budget, but that was never effectively accomplished. An audit in 1317 indicated income of 1,600,000 and expenditures of 9,000,000 *maravedís* for maintenance of the royal court, custody of castles, and stipends for the nobility. As a basis for

assessing taxes a *padrón* was drawn up in each locality listing taxpayers and estimating their wealth.

Confusion seems to have been the hallmark of financial administration into the late Middle Ages, when some effort at reform was undertaken. The role of the *mayordomo mayor* was now honorific, and the office of *almojarife mayor* disappeared in the late fourteenth century; the *despensero mayor* continued to pay the salaries of members of the royal household. Tax collection was in the hands of *recaudadores* named in each district or *partido*. The principal financial administrators were now divided between the *contaduría mayor de hacienda* and the *contaduría mayor de cuentas*. Two accountants, or *contadores mayores de hacienda*, saw to the collection and disbursement of the king's ordinary revenues, which were recorded in *libros de asiento*. They also kept books recording alienated income (*libros de lo salvado*). Two additional *contadores mayores de cuentas* reviewed royal accounts, prepared an annual summary of expected income and expenses, and had jurisdiction over litigation concerning any of these issues. After 1436 they were required to take up permanent residence at Valladolid in the Casa de las Cuentas. Fernando and Isabel refined various aspects of this system, making it a more effective means of collecting and controlling the expenditures of royal revenues. As a consequence they greatly increased the income of the crown.

ADMINISTRATION, FINANCIAL, LEÓN

The fundamental resource of the Leonese monarchy was the landed property of the dynasty. From it were derived the horses and oxen that furnished its means of locomotion; cattle, sheep, and grains, which gave it sustenance; rents, which provided for the sophisticated goods that must be purchased in the Islamic south in the early years; and the men who filled out its raiding parties and war bands. The administrator who was responsible for all of this wealth in its various forms was the *merino*. He was essentially an estate manager. Surely he was appointed but rarely was he of such rank as to leave much trace in the documents. The last century of the Leonese kingdom sometimes saw *merinos* of some personal prestige and family but these were the custodians of royal urban properties and so

of a rather different type. Their prime concern would have been the collection of rents from bakeries, forges, and presses owned by the crown, along with the proceeds of justice that they, like their country cousins, administered.

One thinks that such local officials must have been responsible to the royal majordomo at court for their stewardship. Still, it is so far impossible to discern any mechanism that would have regularly connected the two. A later period will see the *merindad* emerge as a fundamental unit of local government and the *merino mayor* as a coordinating official, but these are hard to detect in the kingdom of León. During the reign of the last of its kings, Alfonso IX, there are some persons designated *merino* of much larger units—Galicia, for instance—but not much is known of their function.

The *merino* must also have been responsible for the collection of what was the major tax revenue of the realm, that is, the *fossataria*. This was a “shield tax” levied on those who elected not to perform the *fossata*, or obligatory military service in time of war. No particular machinery was necessary to collect it since the *merino* could simply bring it to the gathering of the royal host.

This same near absence of administration as such marked the entire range of royal revenue and its collection. The coinage was a royal prerogative but the actual mints were located in the episcopal towns and were operated by the bishop, with a share of the proceeds going to the crown. So too, the *portaticum* and the *mercatum*, levies on goods transported or sold, seem often to have been administered by those bishops or abbots who had been allotted a share in them by royal charter, but the collection of the former, especially in country districts, must simply have been leased to local magnates or royal castellans. Likely the procedure was the same with the royal share from the proceeds of mining operations, especially of salt.

Finally, as everywhere during the Middle Ages, the proceeds of the administration of justice belonged to the crown. In fact, as the charters make abundantly clear, everywhere the regular procedure was that they were to be divided, most frequently evenly, between the injured party and the crown. The position of judge became most visible in the documents, although judges were ordinarily the most humble of officials, and exclusively local. Most probably, the collection and forwarding of the royal share of the imposts arising from their work again fell on the *merino*, castellan, or bishop of the vicinity. There is no trace of alternative machinery either at the local or royal levels.

While all of these rents and customary revenues may have sufficed ordinarily in time of peace, they had to be supplemented in wartime, which was quite frequent. By the second half of the twelfth century a

special revenue, the *petitum*, emerged, and its levy was occasional and general. Again, since it was a special impost no particular machinery seems to have been devised to collect it, and apparently the proceeds would have been borne to a royal *curia* or assembly of the host by those who attended.

At the beginning of the thirteenth century this tradition of royal entitlement to special “grants in aid” in times of emergency would be linked to the emergence of the new *cortes* in both León and Castile. Doubtless, such requests had ordinarily been made in the context of a royal *curia*. One such grant may have been made at the first cortes of León in 1188, but the documents are not clear. Certainly one was authorized at the cortes at Benavente in 1202, where it was linked to a royal promise not to tamper with the coinage for a period of seven years afterward. Such a linkage became common in both León and Castile, and suggests that the bulk of the revenue was to be derived from the merchant community. Before 1230 there is no evidence that special tax collectors were appointed for its collection.

ADMINISTRATION, FINANCIAL, NAVARRE

Every state with a foreign policy and managed by a king and a court needs a serious financial administration. In the thirteenth to fifteenth centuries, the kingdom of Navarre had its own treasury and experts. The treasurer of Navarre, whose yearly registers detailed the expenditure and receipts kept, was usually a French clerk (Simon Aubert in the beginning of the fourteenth century) or a Navarese middle-class person (Juan Caritat, a “Franco” from Tudela, in the end of the fourteenth century). Helped by a chamber of deniers which supervised the minting of money, and by a chamber of accounts, which managed and judged the fiscal cases, the treasurer’s main function was to plan the state’s expenditure (war, fortifications, troops’ pay, military and civilian officers’ wages, equipment work, amounts of money granted to the king’s loyalists, and court’s expenditure); and to attend to the coming in of the receipts (*pechas* of the taxable commoners and of

the Moors and Jews—that is to say, taxes of quota raised by homesteads, indirect miscellaneous taxes on trade, bridges, markets and fairs, registering rights under the king's seal). Therefore, the treasurer controlled the provincial tax collectors, as well as all the officers of the court charged of a specialized duty and entitled to certain spending necessary to their responsibilities.

In the thirteenth to fifteenth centuries, the claims for “exceptional help” periodically returned. The king or his representative then convoked the *cortes* (parliament) and the delegates of the prelates, nobility, and “good towns” accepted the amount of money requested by the treasury for war causes, royal events, princely weddings, fortifications, and the like.

Social categories that were usually tax free, such as the Church and nobility, collaborated most often to these exceptional levying. The sovereign always had the ability to exempt his subjects in a personal capacity, with a seal charter. For this reason expenditures very quickly exceeded receipts (a merino received 2,000 pounds in yearly wages, for instance, causing the expenditure of the court to possibly exceed 50,000 pounds each year) that relied only on the demography and economic prosperity of Navarre. During the fourteenth and fifteenth centuries the treasury had to resort to short-term measures. By the mid-fourteenth century, the treasury regularly leased taxations, either directly or indirectly. For a fixed and yearly amount of money, the *arrendadores* managed for themselves the royal resources; they gathered in groups of six to twelve members, most often Navarrese and Jews from the kingdom; thus, in 1392, they gave 60,000 pounds to the treasury, and then had enough money come in to be paid back. These amounts paid in advance and in one payment were still not enough for the courts of Charles II and Charles III (1349–1425), who constantly borrowed from the nobility, middle-class, and Jews and reimbursed them by giving them a fraction of the royal incomes, or by making installments, interest and usury being wholly legal in Navarre around 1400.

ADMINISTRATION, FINANCIAL, PORTUGAL

The financial administration of the kingdom of Portugal was based originally on that of the kingdom of León-Castile, from which Portugal separated in the

twelfth century. At that time the personnel responsible for the collection of tributes owed to the crown was undifferentiated from that of other administrative offices. Moreover, as many royal officials were remunerated from local contributions, those moneys did not ordinarily enter the royal treasury. Initially the *maior-domus curie* or *mordomo mor*, as he was known, not only supervised the royal household but also had general responsibility for the administration of royal revenues. From the thirteenth century onward as awareness of the distinction between the king's private patrimony and the public patrimony of the state increased, the role of the *mordomo mor* was restricted to the finances of the household, and general supervision of the collection and disbursement of tributes was entrusted to *almoxarifes*. The collection of royal revenues was usually given over to tax farmers who promised to pay the crown a certain sum from the various tributes and taxes collected and of course to pocket a profit for themselves. Municipal councils preferred to collect their own tributes.

The sources of royal revenue were many and varied but of unequal importance. There were tributes in the form of rents and services (*pectum*, *peito*) owed by the tenants on royal estates. In addition, the king was entitled to pasturage fees (*montado*); tolls (*portagen*) collected at roads and bridges; market tolls (*açougagen*, *alcavala*, *sisas*); judicial fines (*coima*) imposed by his courts; payments made in place of personal military service (*Fossataria*); and lodging and hospitality (*colheita*), which became a regular payment in money whether he visited each locality or not. He could also call on local inhabitants for service in building and repairing bridges, roads, and castles (*fazendera*), and to provide transport for himself or his representatives. He was also entitled to a fifth of any booty, and a fifth of the income derived from the exploitation of mines.

In the thirteenth century the Portuguese kings began to feel the need for extraordinary taxes to meet their steadily increasing financial requirements. To some extent that need was met by convoking the *cortes* (parliament) and asking the representatives of the townspeople for subsidies (*pedidos*). An early example of this came during the reign of Afonso III (1248–1279) who tried to improve his financial resources by altering the coinage. The ensuing economic distress evoked strong protest and he had to negotiate a solution with the *cortes*. In return for the king's pledge not to debase the coinage for a period of seven years, the *cortes* granted him a subsidy called *monetágio* or *moeda foreira*. The kings also exacted forced loans (*empréstimos*) and levied customs duties of a tenth (*dizima*) of the value of imported goods. The *sisas*, a

sales tax, appeared as a royal tribute in the reign of Fernando (1367–1383), though it may antedate him; it remained an extraordinary tribute until the reign of João I (1385–1433) when it became a permanent levy.

King Dinis (1279–1325) established the rudiments of a financial bureaucracy separate from the royal household. The royal treasurer (*tesoureiro*) assumed general oversight of royal finances and received accounts from *almoxarifes* and other subordinate officials. Extant today are four incomplete books (*libri de recabedo regni*) recording royal revenues in the thirteenth century as well as the accounts of the *almoxarife* in 1273. As the variety of royal revenues became more extensive so did the apparatus responsible for their collection and disbursement. In the fifteenth century two *veedores da fazenda* (overseers) of the treasury assumed responsibility for financial administration and also adjudicated litigation concerning royal revenues.

According to Fernão Lopes, King Pedro (1357–1367) was especially careful in the management of royal finances, so that when Fernando succeeded him he found a treasure in Lisbon Tower of 800,000 gold pieces, 400,000 marks of silver, as well as other coins. Excluding the customs of Lisbon and Oporto, the revenues of the crown amounted to 800,000 *libras*, or 200,000 *dobras*, a significant amount. The customs of Lisbon were reported to be 35,000 to 40,000 *dobras* annually. The first royal budget appeared in 1473, with revenues of 47,000,000 *reais* or 145,000 gold *cruzados*, and expenses of 37.6 million *reais* or 115,600 *cruzados*. The bulk of those revenues, 81 percent, was used for the maintenance of the king, his court, and his family, and for stipends given to members of the nobility. As the medieval centuries drew to a close the expenses of royal efforts to expand into Morocco and to exploit the newly emerging continent of Africa meant that expenses quickly outran income and forced the government to operate at a deficit.

ADMINISTRATION, JUDICIAL

For the greater part of the Middle Ages the judicial system was inextricably linked to civil administration. Besides the monarch, there were ecclesiastical and secular lords who enjoyed the privilege of immunity, and the Church, which had its own canon law and its own judges; all of these exercised jurisdiction.

Judicial administration in the Visigothic era was complicated by the coexistence of both Roman and Visigothic laws. Hispano-Romans were ruled by the Theodosian Code of 438 and its later derivatives. The Visigoths lived according to custom, but efforts to codify their law and to establish a uniform law for all the inhabitants of the peninsula were made. This process culminated in the *Liber Iudiciorum*, completed during the reign of Reccesvinth (653–672). This was a systematic, comprehensive code of law, derived in large part from Roman law, and unparalleled elsewhere in the barbarian kingdoms of western Europe. Justice was administered by the king and provincial officials.

In the kingdom of Asturias-León the *Liber Iudiciorum* continued in use, but in Castile custom prevailed. In the eleventh and twelfth centuries the new municipalities received *fueros* or charters regulating the status of persons and property and their obligations to the crown. The *Fuero* of Cuenca, issued after the conquest of that town in 1177, was the most comprehensive of these texts. The *Usatges* of Barcelona, a compilation formed in the eleventh and twelfth centuries, became the foundation of the legal and judicial system in Catalonia.

The king's court dealt with cases involving the great men, and provincial governors were responsible for administering justice in their respective territories. As there was no hierarchy of courts, there was no system of appeals, though in León one could appeal to the judgment of the book—that is, the *Liber Iudiciorum*. Procedure was largely Germanic. Except in cases of violation of the king's peace, the plaintiff had to bring suit by accusation. Once summoned, the defendant had to give pledges as a guarantee of appearance in court. The process was oral as the parties or their spokespersons argued the case. Once the charge was clearly established, judges of proof determined whether it should be proved by an oath of purgation, the ordeal of hot water or hot iron, or the judicial duel. The judges declared whether the proof was successful, but execution of the judgment was left in private hands. Monetary compensation was possible in case of murder or physical injury. Penalties included fines, confiscation, exile, mutilation, and hanging.

The reception of Roman law in the twelfth and thirteenth centuries brought with it the idea that the king had the primary responsibility for declaring the law and administering justice. This principle was enunciated clearly in the *Siete Partidas*, a code of law drawn up by Alfonso X of Castile for use in his court, and in the *Fuero Real*, a code of municipal law. The *Partidas* were translated into Portuguese under the aegis of King Dinis, and both texts influenced the development of Portuguese law. Roman law was the basis for the

Fori regni Valentie promulgated by Jaime I in 1240 but the *Code of Huesca* published in 1247, was largely comprised of the traditional laws of Aragón. While officials responsible for public administration also dispensed justice, a clear hierarchy of jurisdiction descending from the king through the provincial governors (*adelantados*, *merinos*, *vequeres*) and the municipal *alcaldes* was recognized. In Castile, *alcaldes fijosdalgo* and in Aragón the *justicia* were appointed to adjudicate litigation involving the nobility. Alfonso IX of León affirmed the principle of due process of law in 1188, as did his successors. Although prelates and nobles continued to exercise jurisdiction in immune lands, the king reserved the right to intervene in crimes such as treason, theft, rape, and highway robbery.

Under Roman influence procedure was now written rather than oral and purgation and ordeals were abandoned as methods of proof. Litigants could be represented by procurators and by professional lawyers (*advocati*, *voceros*). The *inquisitio* or inquest involving the sworn testimony of witnesses came into frequent use as a means of resolving civil cases. On the basis of the inquest or documentary evidence, the judge pronounced judgment but one could then appeal to a higher court. The inquest was also used to identify criminals, who were then arrested and brought to trial. In that way injured parties were relieved of the danger of retaliation by bringing an accusation.

From time to time kings such as Alfonso X endeavored to restructure the royal tribunal to make it more efficient. In 1371 Enrique II established the *audiencia*, composed of a number of auditors that came to be known as the *chancilleria* because it often sat in chancery rooms. The *audiencia* continued to follow the king until 1442, when Juan II decided that it should have a permanent residence at Valladolid. João I of Portugal also established the Casa do Cível at Lisbon. The Casa da Justiça da Corte was reorganized as a supreme court of appeals. After the conquest of Granada, Fernando and Isabel entrusted the Chancillería of Valladolid with jurisdiction over cases north of the Tagus River and created a new Chancillería with jurisdiction south of the river at Ciudad Real; it was moved to Granada in 1505. With increasing frequency the crown appointed judges to administer justice in the towns.

In the fourteenth and fifteenth centuries significant efforts were made to record and codify the laws. In Castile, Alfonso XI promulgated the *Ordenamiento de Alcalá* in 1348 and gave juridical force to the *Siete Partidas*. The ordinances of the *cortes* (parliament) were another source of law. Fernando and Isabel promulgated in 1484 the *Ordenanzas reales de Castilla*, a collection of the fundamental laws of the realm com-

plied by the jurist Alfonso Díaz de Montalvo. Fernando also issued a new edition of the *Constitucions i altres drets de Cathalunya* in 1495 and of the *Fueros y observancias del reino de Aragón* in 1496. The *Ordenações Afonsinas* promulgated in Portugal in 1446 served as the basis for the *Ordenações Manuelinas*, promulgated by Manuel I in 1521.

ADMINISTRATION, TERRITORIAL, CASTILE, PORTUGAL, LEÓN, ARAGÓN-CATALONIA, NAVARRE

In Roman times Spain was initially formed into two provinces, Hispania Ulterior and Hispania Citerior (whence later references to "the Spains"). Under Diocletian (284–305) the peninsula was divided into five provinces, Tarraconensis (Tarragona, the capital), Carthaginensis (Cartagena), Lusitania (Mérida), Baetica (Seville), and Gallaetia (Braga). This system survived into the Visigothic era, when the provinces were governed by *rectores*, *iudices*, or *duces* with both civil and military authority. Provincial subdivisions called *territoria* consisted of a city and its dependent area. As cities decayed as commercial and industrial centers the municipal *curia* so typical of Roman administration disintegrated. Henceforth a city was important as the headquarters of a provincial governor.

The Muslim invasion disrupted all aspects of civil administration, but Islamic Spain was divided at first into five zones corresponding more or less to Andalucía, Galicia and Portugal, Castile and León, Aragón and Catalonia, and Septimania or Gallia Gothica. Under the rule of the caliphs of Córdoba a more effective provincial regime was instituted as the realm was divided into at least twenty-one provinces whose extent in some cases probably corresponded to those of the Visigothic era. Provincial governors with both civil and military responsibilities ordinarily resided in the chief cities. Military commanders governed the frontier, which was divided into three segments: the Upper Frontier, embracing Catalonia and Aragón, with headquarters at Zaragoza; the Middle Frontier, centered at Medinaceli and running along the borders of Castile and León; and the Lower Frontier, touching Galicia and Portugal and administered from Toledo. These frontier governors often enjoyed considerable auton-

omy given the great distance separating them from the capital. The towns of Islamic Spain were not endowed with rights of self-government, but were directly controlled by the ruler who appointed a *sāhib al-madina* to maintain law and order, a *qāḍi* or judge who dispensed justice according to the Koran, and the *muḥtasib* who inspected the market.

After the breakup of the caliphate of Córdoba many of the provinces, such as Seville, Córdoba, Jaén, Granada, Málaga, Murcia, Baza, Almería, Beja, Silves, Badajoz, Valencia, and Mallorca, were formed into petty kingdoms known as *tā'ifas*. The *tā'ifas* were displaced in the late eleventh and twelfth centuries by the Almoravids and Almohads of Morocco who successively subjugated Islamic Spain and governed it through members of the royal family acting as viceroys. Once Muslim rule was reduced to the kingdom of Granada in the thirteenth century the royal *wazīr* appointed provincial governors, but large areas were often held as lordships. The Ashqilula family, for example, controlled Guadix, Comares, and Málaga, and often acted in opposition to the king. As the price of military assistance the kings of Granada also yielded important places such as Gibraltar and Algeciras to the Benimerines who ruled Morocco in the thirteenth and fourteenth centuries.

The system developed in Christian Spain after the collapse of the Visigothic kingdom was essentially new. The tiny kingdom of Asturias-León was initially divided into small districts (*mandationes*, *commissa*) often governed by officials having the personal title of count. Counts and other officials served at the king's pleasure and ordinarily did not acquire a hereditary right to their office. Together with their subordinates (known as *maiorini* or *merinos*) they had full responsibility for dispensing justice, collecting taxes, and providing for defense. Castile, which originated as a frontier province of the kingdom of León, was administered by a count. In the tenth century Fernán González transformed this into a hereditary office and so the county of Castile became an independent entity. In the Pyrenees a series of counties were created as part of the Carolingian empire. By the tenth century the counts had secured a hereditary right to their offices and also achieved practical independence of the Capetian kings of France. Their subordinates were known as vicars or viscounts. What cities or towns there were existed principally as administrative centers, and there was no organized municipal government.

In the eleventh and twelfth centuries the concession of immunities and the emergence of municipalities resulted in the decline of counties as major territorial divisions. Tenancies of districts, towns, and fortresses were assigned to royal vassals variously

called *tenentes*, *seniores*, or *alcaldes*. Only in Aragón (from 1134) and Navarre did they hold their offices or *honores* by hereditary right. A *merino mayor*, aided by subordinate merinos, appeared as the chief administrative officer in Castile after 1180. The Catalan counts were assisted by vicars (*vicarii*) with civil and military responsibilities and bailiffs (*bajuli*) who collected tributes.

From time to time the king granted the privilege of immunity in perpetuity to lands held by hereditary right by bishops, monasteries, nobles, and military orders. The beneficiary had authority to maintain law and order, appoint judges, administer justice, collect tributes and fines, and require military service. The lands so privileged were immune from the intervention of royal officials except in case of negligence, or in cases of treason, rape, robbery, and destruction of highways. The most notable immunity was that enjoyed by the archbishop of Compostela over broad lands in Galicia. The *pertiguero mayor* was the archbishop's representative. In the second half of the twelfth century and the first half of the thirteenth, large areas south of the Tagus River in both Castile and Portugal were handed over as lordships to the military orders of Santiago, Calatrava, Alcántara, and Avis, who were responsible for all aspects of defense and administration.

The municipalities in the central regions between the Duero and the Tagus river valleys enjoyed self-government in direct dependence on the king, who granted charters or *fueros* spelling out their military and tributary obligations, and the rights of the citizens. Consisting of an urban nucleus and an extensive dependent rural area (*terminus*, *alfoz*), and often populated with villages, the municipalities were a major element in the defense and control of vast areas in the kingdoms of Castile, León, and Portugal abutting the Islamic frontier. While the king appointed a noble (*dominus ville*, *senior civitatis*, *alcaide*) to guard the citadel or *alcazar*, an assembly of neighbors (*concilium*, *concejo*) was responsible for general municipal administration. A *judex* or *juez* headed the town government and was aided in the administration of justice by several *alcaldes* chosen from the parishes of the community. Other officials were in charge of finances (*iurati*, *fieles*), the collection of fines and taxes (merinos), inspection of the market (*almotacén*, *zabazoque*), inscription of public documents (*notarios*, *escribanos*), and the maintenance of law and order (*sayones*, *alcuaciles*). After the conquest of Andalucía, Murcia, and the Algarve in the thirteenth century this municipal regime was introduced into southern cities such as Seville, Córdoba, Cartagena, and others.

The reconquest of these southern provinces in the thirteenth century also resulted in the creation of new

extensive territorial districts governed by officials with responsibility for maintaining law and order, dispensing justice, and collecting tributes and fines owed to the king. Each of the principal constituents of the crown of Castile-León after the union of 1230—namely, the *merindades* of Castile, León and Asturias, and Galicia—was administered by a merino mayor whose principal responsibility was the administration of justice. Under Alfonso X the title *merino mayor* was changed to *adelantado mayor*; in the fourteenth and fifteenth centuries these titles alternated at times, but generally in Castile, León, Asturias, and Galicia the principal representative of the crown was usually called *merino mayor*. On the southern frontier the *adelantado mayor de la frontera*, as the chief administrator of Andalucía was called, was charged mainly with military defense against the Muslims. Another adelantado mayor exercised a similar responsibility in the old Muslim kingdom of Murcia. These posts were usually held by leading members of the nobility who often abused their powers, prompting the *cortes* (parliament) to complain again and again that only those who loved justice should be given this responsibility.

Other *adelantados mayores* (later known as *merinos mayores*) were entrusted with the administration of the Basque provinces of Álava and Guipúzcoa. Guipúzcoa was incorporated into the kingdom of Castile in the reign of Alfonso VIII (1158–1214) while Alfonso XI added Álava in 1332. Vizcaya in the eleventh century was ruled by a count under Castilian suzerainty; in the twelfth century it became a lordship held by the López de Haro family. Juan I (1379–1390) finally annexed Vizcaya to the crown; henceforth the king's representative there was called a *prestamero mayor*. In the later medieval centuries an *hermandad* or association of cities, towns, and districts was organized in Vizcaya, Álava, and Guipúzcoa, whose customs the king or his representatives swore to uphold. From the fourteenth century the archbishop of Toledo was also represented by an adelantado mayor in the frontier lordship of Cazorla.

Portugal was also divided into zones, each governed by a *meirinho mor* and marked out by river boundaries—namely, Além Douro, Aquém Douro, Entre Douro e Minho, Entre Douro e Mondego, and Entre Douro e Tejo. The municipal regime in Portugal was comparable to that of Castile-León.

As the Crown of Aragón consisted of several distinct elements—namely, the kingdoms of Aragón, Mallorca, and Valencia—and the county of Barcelona—the territorial administration was complicated. The heir to the throne was usually named procurator general of all the kingdoms, or lieutenant general. In the fifteenth century the office of lieutenant general

assumed relatively continuous existence as Alfonso V pursued his ambitions in Italy. During his lengthy absence his wife María or his brother Juan were empowered to act for him throughout his dominions, effectively exercising the authority of a viceroy. In each of the constituent realms a procurator general (later called a governor general) represented the king during his absence. In Valencia and Mallorca that post was more or less permanent. Catalonia was divided into a varying number of vicariates (Rousillon, Cerdanya, Pallars, Manresa, Osona, Girona, Barcelona, Vilafranca, Cervera, Tárrega, Lérida, Montblanch, Tarragona, and Tortosa), each under a vicar (*veguer*) entrusted with full authority in matters of administration, justice, and defense. There were two vicariates in Mallorca—one for the city of Palma and the other for the rest of the island. In Aragón and Valencia justiciars (*justicia*) fulfilled much the same role as the vicars. The king also appointed *sobrejunteros* to direct the activities of *juntas* or associations of Aragónese towns organized to preserve order, to suppress crime, punish criminals, and levy fines. In the fourteenth century sobrejunteros presided over six such administrative districts—namely, Zaragoza, Huesca, Teruel, Jaca, Tarazona, and the counties of Ribagorza and Sobrarbe; a century later Exea had replaced Teruel. In the fifteenth century Valencia was divided into four zones or *governacions* (Valencia, Játiva, Castellón, and Orihuela), each administered by a *portant-veus* representing the governor general. Side by side with the vicars and justiciars, there were other officials whose duties were primarily financial—namely, the *batlles* or *bayles mayores* of Catalonia, Valencia, and Mallorca, entrusted with the collection of royal revenues.

Given the frequent absence of the kings of Navarre of the French dynasty of Champagne, a governor general often had full responsibility for the administration of the kingdom. In the fourteenth century Navarre was divided into six *merindades* (Pamplona, Tudela, Estella, Sangüesa, Ultrapuertos, and Olite).

A major development in the later Middle Ages was the increase in the number and extent of lordships held by the nobility immune from the supervision of royal officials. The reason for this was the king's need to gain support and to keep it. Enrique II (1369–1379), the first of the Trastámaran kings of Castile, was notorious for his *mercedes* or favors granting lordships and other favors to his adherents. Not only were rural estates alienated, so also were towns that had long been directly under the rule of the king and had long enjoyed self-government as such. Typical of such concessions was Juan II's charter of 1453 conferring certain towns on the widow of Álvaro de Luna "in hereditary right, for ever and ever . . . with their fortresses, lands, jus-

tice, civil and criminal jurisdiction, high and low justice, *merum et mixtum imperium*, rents, tributes and rights belonging to the lordship of those places.” The cortes from the thirteenth century onward consistently protested such alienations and demanded that the king recover domain lands already alienated or usurped by others. Afonso III of Portugal (1248–1279) conducted extensive inquests to determine whether royal lands were in private hands, but efforts to recover them were often unavailing. João I (1385–1433), the first representative of the house of Avis in Portugal, ceded to his constable Nun’ Alvares Pereira the counties of Ourém, Barcelos, and Arraiolos, as well as eighteen cities and towns. The king subsequently hoped to resume possession of alienated royal lands, but it was left to his son Duarte in 1433 to enact the so-called *lei mental*, the law his father had in mind; according to this estates granted by the king were heritable only by the firstborn male and could not be divided; in default of a male heir such lands would revert to the crown. In spite of that Duarte’s son Afonso V was extraordinarily liberal, as was Enrique IV of Castile, in yielding towns, lands, and other royal rights in lordship.

From the thirteenth century onward urban oligarchies gained control of the cities and towns, eliminating the lower classes from any real participation in public affairs. At the same time factionalism within the ruling aristocracy increased to such a point that the crown had to intervene to maintain order. Alfonso X tried to subordinate municipal fueros to a common royal law known as the *fuero real* but encountered strong opposition. To curb factional disputes kings began to send royal officials (*jueces de salario*, *vededores*, *juizes da fora*) to supervise municipal affairs. From the reign of Alfonso XI these officials known as *corregidores* began to assume a permanent status in the towns of Castile and Portugal. Municipal autonomy was also restricted when the king began to appoint the *regidores* or members of a small council or *ayuntamiento* (usually numbering twenty-four), which came to exercise the role of the older general assembly of citizens. In the thirteenth century the cities and towns of the Crown of Aragón also developed the instruments of self-government, such as a small council that supplanted a larger council of all the citizens. In Barcelona, for example, five councilors chosen yearly were charged with the oversight of day-to-day affairs while a *consell de cent* or council of one hundred also chosen annually met when the need required. A council or *cabildo* in Aragón consisting of several *jurados* or sworn men was elected annually to manage affairs; in Valencia six *jurats* performed a similar function. In Catalonia the king’s vicar often supervised and regulated the activities of the towns; the royal justicia or

zalmedina did likewise in Aragón and Valencia. While the towns increasingly lost internal autonomy as a consequence of royal intervention, further losses were incurred in the fifteenth century as many towns were handed over in lordship to nobles whose favor the king wished to purchase or retain.

Fernando and Isabel, whose marriage united the kingdoms of Castile and Aragón, and João II of Portugal adopted several measures intended to give them greater control over the territorial administration of their respective kingdoms. The Catholic Kings replaced the *adelantados* and *merinos mayores* with *alcaldes mayores*, responsible for the major subdivisions of the crown of Castile—namely, Castile, León, Andalucía, Murcia, and Granada. Asturias and Galicia continued to be administered by *merinos mayores* and Cazorla by an *adelantado mayor*. The territorial administration of the Crown of Aragón remained substantially unchanged. In Álava the crown was now represented by a *diputado general* and in Vizcaya and Guipúzcoa by a *corregidor*. In addition, Fernando and Isabel deprived the municipalities of the last vestiges of autonomy by dispatching *corregidores* to them all after 1480. João II also sent *corregidores* to assume responsibility for the administration of the Portuguese towns. His successor, Manoel I (1495–1521) undertook a review of all municipal charters, with the purpose of standardizing their obligations.

One of the major accomplishments of both Fernando and Isabel and João II in restoring the power and prestige of the monarchy was the recovery of alienated crown lands and the subordination of lordships to royal authority. With papal approval Fernando and Isabel took control of the lordships of the military Orders of Calatrava (1489), Santiago (1493), and Alcántara (1494), placing their general administration in the hands of the Consejo de las Órdenes. The lands of the orders were divided into eighteen districts, each administered by a *gobernador* or *alcalde*. Similarly, João II and Manoel I administered the lordships of the military orders of Avis and Christ, which were incorporated into the crown in 1551. As the medieval era came to a close in both Spain and Portugal the crown was taking steps to gain more effective control of territorial and municipal administration.

ADMINISTRATION, TERRITORIAL, MUSLIM

Al-Andalus was divided into ten “climates” (Arabic *aqālīm*, sing. *iqlīm*, does not translate the same as the English “climate”; rather, it designates areas or regions). There is some confusion as to the term, for in Andalusian Arabic the Berber term *kūra* (pl. *kuwar*) was used for “districts” and *rastāq* (pl. *rasātīq*) for “province.” There were ten of these regions: Aljarafe (al-Sharaf), the present province of Huelva; Albuhera, the present province of Cádiz (apparently the district called *Tākurunnā* in some Arabic sources), including Gibraltar, Algeciras, Tarifa, Cádiz, Rota, Jerez, and Arcos de la Frontera; Sidonia, which is a problem, and may refer to the Seville region, according to Saavedra, but this is unlikely and seems instead to be Shadūna, or Medina Sidonia; Campania, the province of Córdoba, including Écija, Baena, Lucena, and others; Osuna, which included sections of Estepa, Osuna, and Morón; Reya, the present province of Málaga, except for Ronda, and including parts of Córdoba and Granada; Elvira, the present province of Granada, excluding Alhama, Baza, and Huéscar (this region is variously referred to also as *jabal shulayr* or *jabal al-thalj*; i.e., the Sierra Nevada); Pechina, which only Al-Idrīsī mentions as a region, including the area of Almería; and Ferreira, the present area of Baza, Huéscar, and others. (Idrīsī also mentions al-Busharrāt, as including the kingdom of Jaén.)

Some Muslim sources refer also to “marches” (*thughūr*; sing. *thaghr*) in the northern valleys of the Ebro and Tagus, with the upper capital at Zaragoza and the lower at Toledo, but this is as problematic as the so-called march in Christian geography. The Pyrenees were referred to romantically as the “temple of Venus” (*haykal al-zuhara*), or more prosaically as “mountains of the ports” (*jibāl al-burt*). Each of these *kuwar*, or provinces, was administered by a governor (*wālī*) who resided in the provincial capital.

The Muslim government in Spain was highly organized, becoming more bureaucratic during the established caliphal period. The primary official was the *hājib*, often unhelpfully translated as “chamberlain,” who in fact was the prime minister and often the military commander (interestingly, the word derives from a root that means “veil, conceal”; cf. *hijāb*, a veil). Originally, it is true, his function was to guard the entrance to the caliph, but in fact the office was far more important. After the fall of the caliphate, the *tā'ifa* rulers often used the title *hājib* to refer to them-

selves. Under the Almohads, the title seemed no longer to be known.

The *wazīr*, next in importance, was usually in charge of a particular department of the *dīwān* (chancellery), but the title was also given to those who were privileged to sit in council with the ruler. If one of these was also an administrator or other kind of officer, he held the title *dhū-l-wazartayn* (“master of two offices”), such as we find for the Jew Samuel Ibn Naghrillah in the *tā'ifa* kingdom of Granada, who was prime minister and also commander-in-chief.

The *khātib* was a secretary; there were increasing numbers of these, and they had to be highly skilled in calligraphy and styles of Arabic correspondence. Some were high-ranking administrators, such as the *kātib al-rasā'il*, in charge of the whole chancellery. Next in importance was the *kitābat al-dhimām*, or “secretariat of protected minorities.” Although al-Maqqarī makes it sound as if this office was literally concerned primarily with the “protection” of Christians and Jews, it is clear from what he writes that it was the equivalent of the *khātib al-jihbādihah*, or tax officer, in other Muslim lands, and that its primary purpose was the collection of taxes from the *dhimmis*.

Other minor officials included the *sāhib al-shur-tah*, a magistrate of morality and other civil crimes in at least the major cities (several Jews had this title also, including the famous scholar Abraham bar Hiyya, known in Latin as Savasorda, and Moses Ibn Ezra, the renowned poet of Granada). Others were the *sāhib al-madīna*, an official responsible for municipal services, the *muḥtabib*, supervisor of markets, and others (including that of the very efficient mail service).

Administrative orders were issued to the provinces through the secretariat, and most importantly taxes were imposed on the provinces, particularly for the support of the army. The expenses of the latter must have been enormous, for the Muslim army was nearly as organized and bureaucratic as a modern one. Salaries and expenses had to be paid also for the military doctors, masons, carpenters, and builders of siege machines, as well as the maintenance of a vast array of weapons. Taxes for these came not only from the Muslims, but also the *dhimmis* (Christians and Jews) of the provinces.

The *tā'ifa* kingdoms, themselves roughly equivalent to the provinces, administered correspondingly smaller territories, of course (the kingdom of Granada being the largest) but maintained essentially the same type of government.

The Almoravids and the Almohads of the twelfth and early thirteenth centuries essentially appear to have maintained the original territorial or provincial divisions (or at least as many of them as applied to the

lands they were able to hold) and utilized the basic government offices already long established in al-Andalus, with some changes in titles. Finally, the *naṣrī* dynasty of the last surviving Muslim kingdom, that of Granada, simply divided its kingdom into *kūwar* (no less than thirty-three of them) that were administered in much the same manner.

An important subject that remains to be studied is what influence, if any, Muslim government administration had upon the Christians in Spain.

AFONSO HENRIQUES, OR AFONSO I

Count of Portugal from 1128, king of the Portuguese from 1140, conqueror of Lisbon in 1147, and forebear of all three Portuguese dynasties, Burgundian, Avis, and Bragança. Afonso's mother was the illegitimate daughter of Emperor Alfonso VI of León and Ximena Moniz of the Bierzo. The emperor had awarded Portugal with Galicia to his heiress Urraca on her marriage to Count Raymond of Burgundy, but when Raymond failed before Lisbon in 1094, he detached Portugal and Coimbra and gave them to Teresa on her marriage to Count Henri, Raymond's cousin. They were installed at Guimarães, where their son Afonso was born, probably in 1109, the year of the emperor's death. Teresa used the title of "queen," despite Urraca's disapproval. Henry was killed while claiming Zamora in May 1112, leaving Afonso and two daughters. Teresa entrusted the defense of Coimbra to the Galician count Fernando Peres of Trava, and endured the attempts of Gelmírez, first archbishop of Santiago, to overthrow the ancient primacy of Braga. Afonso appears in her documents

from 1120. He was educated by barons of the Douro, who in 1128 removed Teresa and Trava in the battle of São Mamede, near Guimarães. Urraca's son Alfonso VII had been knighted at Santiago, and Afonso Henriques armed himself knight at Zamora in 1126. He now defied his cousin, with varying success, but did not appear when Alfonso VII assumed the title of emperor in 1135. A clash at Cerneja was averted by a Muslim attack on Coimbra. Afonso assumed the title of king in 1140, probably following the death of the aged Gelmírez. The miraculous victory of Ourique, once considered a proof of divine approval, is undocumented. In 1143 he reached agreement with his cousin at Zamora, and obtained the consent of Rome. Afonso married Mafalda, daughter of the Count of Savoy and Maurtienne, in 1145 or 1146 and in March 1147 recovered Santarém (lost in 1111) in a surprise attack. St. Bernard's preaching of the Second Crusade brought a large contingent of 164 ships from England, the Low Countries, and southern Germany that participated in the conquest of Lisbon. An English priest, Gilbert of Hastings, became the first bishop of the restored diocese. Sintra and Palmela also capitulated, almost doubling Afonso's territories. His own wealth and authority were greatly increased, rendering secure the continuity of his house. He installed the military orders in castles to defend the line of the Tagus, while the Cistercians undertook the cultivation and settlement of largely abandoned frontier areas, from their headquarters at Alcobaça, founded in 1153. His usual capital was Coimbra, where the monastery of Santa Cruz Alcobaça served as his scriptorium and treasury. Queen Mafalda died there in 1157, having given him three sons and four daughters.

Although Afonso's daughter Urraca married Fernando II of León, now separated from Castile, the frontier beyond the Tagus was disputed. Afonso supported the adventurer Geraldo Sem Pavor who from Évora seized Badajoz, where in 1169 Afonso was wounded and captured, peace was later made at Pontevedra. Afonso remained incapacitated, and shared his military responsibilities with his heir, Sancho, born at Coimbra in 1154. Although Alcácer do Sal was taken in 1158, much of the lower Alentejo was overrun in the great Almohad invasion of 1171. Afonso Henriques obtained full recognition as an independent monarch from Pope Alexander III in 1179. He died at Coimbra on 8 December 1185 and is buried at Santa Cruz, the present monument having been erected by King Manoel. Afonso's qualities of boldness, persistence, and astuteness firmly established the Portuguese monarchy, free from the entanglements that had frustrated his mother.

The documents of Afonso Henriques are excellently edited by R. P. de Azevedo; see the *Documentos medievais portugueses* (Lisbon, 1958).

AFONSO II, KING OF PORTUGAL

Afonso II, Portugal's third monarch, was born in Coimbra in 1185, son and successor of King Sancho I and his Aragóense wife, Queen Dulce. Rarely in good health, Afonso was obese and most probably died of advanced leprosy on 25 March 1223. In 1208 he married Urraca, daughter of Alfonso VIII of Castile. Afonso II took over the kingship of Portugal at the end of March 1211.

Though his reign was relatively short, it was far from uneventful. Afonso II did much to consolidate the various gains of his predecessors, particularly by seeking to augment royal power. In 1211 Afonso II promulgated the first corpus of Portuguese law. This legislation had four chief purposes: (1) to guarantee the rights of royal as well as private property, (2) to regularize the administration of civil justice, (3) to defend the material interests of the crown, and (4) to eliminate abuses by both the clergy and the nobility. Afonso II also developed two institutions to strengthen royal prerogatives: the *inquirições gerais* (general inquiries) to investigate the legitimacy of earlier grants, and the *confirmações* (confirmations). He sent teams of investigators out into the country to check on the legitimacy of claims and grants, and to take testimony. Sometimes the inquiries resulted in an annulment of grants and loss of property or privileges. Predictably, this action to improve public administration and to strengthen royal control caused some turmoil, resented as it was by the higher clergy and nobles, jealous of their prerogatives and immunities. Serious disruptions often limited the scope of the inquiries. However, the investigations did improve public administration and were a model for future kings of Portugal, especially Afonso III and Dinis.

In his will, Sancho I had left part of the royal patrimony to Afonso II's brothers and sisters. Afonso II deemed this a challenge to his sovereignty. He argued that the royal patrimony was indivisible and that he should have jurisdiction over all crown properties.

Rather than face the restrictions that their brother, the king, was putting on their goods and persons, Afonso's brothers left the kingdom for voluntary exile. However, the king's sisters, two of whom (Teresa and Mafalda) had been queens in Castile, refused to accept Afonso II's authority over their grants. When Afonso applied force to get his way, the princesses protested to Pope Innocent III, who reacted in August 1212 by placing Portugal under an interdict that lasted for a year and a half. In the meantime, Afonso paid the pope the annual tribute, which had been in arrears since Sancho I's lump-sum payment late in the preceding century. Finally, a papal bull published by Innocent III in 1216 provided the foundations for a settlement to the quarrel. It asserted that Sancho I had intended that his daughters have the revenue from, but not jurisdiction over, the towns he had willed them. But because of a new conflict involving Afonso II—this time with the archbishop of Braga—that resulted in the king's excommunication, the issue of the royal patrimony was not definitively settled until the beginning of Sancho II's reign in 1223.

In the process of investigating the grants that were claimed by the Church in Portugal, Afonso II annulled a number of them. Estêvão Soares da Silva, the archbishop of Braga, convoked an assembly of clergy and condemned the actions of the king, accusing him not only of abuses against the Church, but of living an adulterous life. The king redoubled his efforts against the Church in northern Portugal. When the archbishop excommunicated Afonso and his chief advisers and put Portugal under interdict, the monarch ordered his forces to destroy the properties of the archbishop, including his granaries, vineyards, and orchards. The archbishop then appealed to Rome, and Pope Honorius III intervened. Afonso II, with an heir only twelve years old and faced with a papal threat of deposition, began negotiations with the archbishop of Braga. But before they were concluded, the king died, an excommunicate.

When Afonso II assumed power in 1211, Portugal's independence was fairly well established, although there still were occasional threats from neighboring Christian kingdoms. In 1212 Alfonso IX of León used the clash between the Portuguese king and his brothers and sisters as an excuse to invade northern Portugal. With help from some Portuguese nobles, including one of Afonso II's brothers, the Leonese defeated the supporters of Afonso II at the Battle of Valdevez. Fortunately for the Portuguese, the threat of hostilities with Alfonso VIII of Castile forced the Leonese king to withdraw from Portugal and Afonso II was able to recover the occupied territory.

There was relatively little fighting against the Muslims on Portugal's borders during the reign of Afonso II. The Portuguese monarch did, however, send troops to aid his father-in-law, Alfonso VIII of Castile, in the famous Battle of Las Navas de Tolosa in 1212, in which the Christians decisively defeated the Almohad forces. Las Navas de Tolosa was the gateway to Andalucía, and the Almohads never recovered from this defeat. The Portuguese distinguished themselves by their bravery in this encounter, the outcome of which is considered by many to be the greatest Christian victory of the Reconquest.

Five years later, when Afonso II was at Coimbra, the bishop of Lisbon convinced knights from the Fifth Crusade to aid the Portuguese in an attempt to regain the important stronghold of Alcácer do Sal. The crusaders, together with the Templars, Hospitalers, and knights of Santiago, captured Alcácer after a two-month siege. The victory opened up the Sado River basin to Portuguese settlement and commerce.

AFONSO III, KING OF PORTUGAL

The second son of Afonso II and Uracca of Castile, Afonso III was born in Coimbra on 5 May 1210. The fifth king of Portugal, he succeeded his brother Sancho II and reigned from early in 1248 to his death on 16 February 1279.

Before becoming king, Afonso lived first in Denmark and then in France, where in 1238 or 1239 he married the wealthy widow Matilda, heiress of the Count of Boulogne. Afonso was influential at the court of his maternal aunt, Queen Blanche, widow of Louis VIII and mother of Louis IX. While in France he became involved in Portuguese internal affairs, where his older brother was under attack by clergy and nobles. Pope Innocent IV, in a bull of 24 July 1245, effectively deposed Sancho II by reducing him to king in name only and by turning over the government to his younger brother, Afonso, Count of Boulogne. Innocent IV instructed the Portuguese to receive and obey Afonso as soon as he arrived in Portugal and to ignore the orders of Sancho II. After the pope issued his bull, a delegation of Portuguese—a number of whom had testified against Sancho II at the Council of Lyons—visited Paris, where they swore obedience to Afonso. They also exacted a series of promises from the future monarch to respect the Church, to honor the

privileges and customs of Portugal, and to promote justice.

Arriving in Portugal in early 1246, Afonso took part in the civil war against supporters of the king. After Sancho II died in Toledo in January 1248, Afonso III was crowned king. The new monarch renewed the policies of Portugal's earlier monarchs by asserting authority wherever possible and by taking a hard line with the privileged classes when their immunities and prerogatives interfered with the royal treasury or administration. Early in his reign, Afonso III took up the task of driving the Muslims from their isolated strongholds in southwestern Portugal. The time was propitious for such a move. Fernando III of Castile, with the aid of the Portuguese military orders and some Portuguese nobles, had been campaigning successfully against the Muslim kingdoms in Andalucía. Seville would fall to Christian forces in November 1248. Afonso II personally led the drive to oust the Muslims from the Algarve. In March 1249 he captured Faro. Soon, Albufeira and Silves, along with a number of lesser towns and fortresses, fell to the Portuguese. This completed the ouster of Muslim military forces from what was to be the limits of modern Portugal. In 1251 Afonso II continued his campaign—this time to the east of the Guadiana River in territory that the Castilians regarded as their preserve. Castile, in the meantime, claimed parts of the Algarve. Armed conflict soon broke out between Portugal and Castile over these disputed territories.

In 1252 Alfonso X “el Sabio” (the Wise) ascended the Castilian throne. A year later, a truce was arranged between the two kings. It was resolved that Afonso III would marry Beatriz of Castile, the illegitimate daughter of Alfonso X. The marriage took place in 1253. In addition, it was decided that the administration of the newly conquered kingdom of the Algarve and the lands east of the Guadiana would be Portugal's but the usufruct of these territories would remain in the hands of Alfonso X until the firstborn son of the marriage between Afonso III and Beatriz reached the age of seven.

Unfortunately, there were a number of difficulties in implementing this marriage arrangement. Beatriz was very young and was related to Afonso III within the fourth degree of consanguinity. But most importantly, Afonso III was already married to Matilda, Countess of Boulogne, who was living in France. Soon Matilda was complaining to the pope about her husband's bigamous marriage. Although Pope Alexander IV placed under interdict those parts of Portugal where the king was residing, he was unable to persuade Afonso III to leave his young bride.

Matilda's death in 1258 helped resolve some of the Portuguese monarch's difficulties. But papal oppo-

sition to the marriage continued, as did the interdict. The bishops and cathedral chapters of Portugal came to the king's defense. In 1260—by which time Beatriz had already borne two children to Afonso—they pleaded with Pope Urban IV to lift the interdict and legitimize the children. They argued that the abandonment of Beatriz by Afonso would lead to war with Castile, and they claimed that ecclesiastical penalties were causing spiritual harm and scandal in Portugal. Finally, in 1263, after a visit to Rome by a delegation of Portuguese bishops, and after much lobbying by European leaders such as Louis IX of France and the Duke of Anjou, the request for the necessary dispensations and legitimizations was granted.

The birth in 1261 of Dinis, Afonso III's third child by Beatriz (the first was a girl, the second a boy who died in infancy), provided the necessary ingredient for the resolution of the controversy between Castile and Portugal. By the Treaty of Badajoz in 1267 Alfonso X of Castile renounced his rights to the kingdom of the Algarve, while Afonso III gave up Portuguese claims to the territories between the Guadiana and Guadalquivir Rivers. Portugal, however, would have authority over the territory to the west of the mouth of the Guadiana and its confluence with the Caia River.

In addition to the reconquest of the Algarve and the resolution of Portugal's boundaries with Castile, several other major accomplishments marked Afonso III's reign. Afonso promoted greater participation by towns and their officials in Portuguese national life. At Leiria in 1254, for the first time in the nation's history, representatives of the cities participated in the *cortes* (parliament) along with the nobility and the higher clergy. Laws were also enacted to protect commoners from abuse at the hands of the privileged classes. Furthermore, Afonso III restructured the country's monetary system. Charters issued during his reign show that a moneyed economy was replacing barter. Fixed monetary taxes replaced the custom of paying in kind. At the *cortes* of Coimbra in 1261, Afonso III agreed to devalue the currency only once during a reign instead of every seven years, as was becoming the practice. The monarch favored Lisbon over Coimbra as the kingdom's chief commercial and administrative center, and he increased the royal treasury by promoting the country's economy.

Afonso III continued his predecessors' policy of strengthening royal prerogatives. This was accomplished chiefly through the use of the *inquirições gerais* (general inquiries) and *confirmações* (confirmations). In 1258, in response to complaints from royal officials as well as commoners, the crown sent investigative teams into the *comarcas* (districts) of Entre Douro e Minho, Trás-os-Montes, and Beira Alta to

examine titles to lands claimed by nobility and clergy. Sworn testimony was taken to determine if the rights of the crown were being respected. Afonso III was anxious to curb the power of the old nobility and the higher clergy, especially those in the comarca of Entre Douro e Minho, the oldest and most populous region of Portugal. These investigations revealed a wide range of violations, including the usurpation of the royal patrimony, evasion of taxes, and abuses of commoners by the privileged estates, both secular and clerical. Laws were promulgated to deal with these infractions and they soon sparked fresh opposition from clergy and nobility.

In 1267 a number of Portuguese prelates traveled to Rome and presented Pope Clement IV with an extensive list of grievances. They accused Afonso III of condoning, even encouraging, violence in civil administration, of using unfair practices in his business dealings, and of infringing on ecclesiastical liberties. The Portuguese monarch answered these charges with testimonials from the towns of the kingdom that defended his actions and praised his administration. In addition, in 1273, during the meeting of the cortes at Santarém, Afonso III established a commission to investigate his acts and those of his officials. But the papacy was not impressed by the results of this investigation, which maintained that there had been little wrongdoing. In 1275 Pope Gregory X ordered that the king correct abuses and promise not to repeat them under pain of a series of penalties. These penalties would be invoked in stages, beginning in 1277, and would progress from local interdict, to excommunication, to a general interdict for the kingdom, to freeing the Portuguese from obedience to their king. And, indeed, by the end of 1277, Afonso III had been excommunicated and the kingdom placed under interdict. Soon, minor revolts broke out against the king in which Afonso III's son and successor, Dinis, took part. In January 1279, a month before his death, Afonso III made his peace with the Church and with his son.

AFONSO IV, KING OF PORTUGAL

The seventh king of Portugal, Afonso IV, was the only son of King Dinis and his Aragónese queen, Isabel (later St. Isabel of Aragón). Afonso was born in Lisbon on 8 February 1291 and died in the same city on 28

May 1357. In 1309 he married Beatriz of Castile; he reigned from 1325 to 1357.

An austere ruler, Afonso IV continued his father's policies of augmenting the crown's patrimony, strengthening royal authority, and promoting justice. His reign, however, was marked by numerous internal revolts, conflicts with Castile, and dislocations in the wake of the Black Death.

During the early part of his reign, Afonso IV was preoccupied with the struggle against his illegitimate half-brother, Afonso Sanches. After the latter's death in 1329, Portugal became embroiled in a conflict with Castile over Afonso IV's daughter Maria, wife of Alfonso XI of Castile (reigned 1312–1350). After Alfonso XI abandoned her, Portugal gave its support to Infante Juan Manuel, Alfonso XI's cousin and a perpetual thorn in the Castilian monarch's side, and to others who contested Alfonso XI's power. In fact, Afonso IV married off his son and heir, Pedro, to Constanza, daughter of Infante Juan Manuel. Alfonso XI then refused to allow Constanza to leave Castile; Portugal, in alliance with Aragón, invaded Castile in 1336.

These disputes among the Christian kingdoms gave the Muslims the opportunity to recover some of the territory they had earlier lost to the Christians. The Marínids were in the ascendancy in North Africa and allied with the Muslims in Granada. Gibraltar was seized in 1333. In 1340 the Marínids invaded the Iberian Peninsula after destroying an Aragónese and Castilian fleet in the Strait of Gibraltar. Castile and Portugal temporarily put their differences aside and signed a peace treaty at Seville in July 1340. A Portuguese, Genoese, and Castilian armada was organized near the Strait of Gibraltar, but storms scattered it. Portuguese forces, led by Afonso IV and accompanied by the archbishop of Braga, the bishop of Évora, and knights from the Portuguese military orders, however, played an important role in the victory at Salado (30 October 1340), a major event in the Christian reconquest of the Iberian Peninsula. In the 1340s Afonso IV sponsored voyages to the Canary Islands.

The Black Death struck Portugal late in September 1348 and continued its devastation for the remainder of the year. The pestilence claimed at least one-third of Portugal's population. Some villages and small towns completely disappeared, while others became greatly depopulated. There was an exodus to the cities by many of the survivors, which further aggravated the problem of rural depopulation. Because the epidemic often wiped out entire families, some shifts occurred within the social strata as distant relatives and the poor came into vast sums of money or substantial properties. The Church also benefited greatly from the many

deathbed grants of estates and goods. A shortage of labor led to higher wages and prices. Famine and food shortages became regular occurrences in many parts of the kingdom as the Black Death was followed by new plagues and epidemics. There were frequent devaluations. Abandoned agricultural lands were turned into vineyards, olive groves, pasturage, or hunting preserves. Social instability and famine led to discontent, unrest, and an increasing number of riots. Afonso IV and his successors used iron-handed methods to try to control these upheavals. They fixed wages, cracked down on vagrancy, and bound workers to their traditional occupations. The *cortes* (parliament) was convened in 1352 and 1361 in hopes of solving some of the problems.

Meanwhile, Prince Pedro's wife, Constanza, who had arrived in Portugal in 1340, gave birth to three children, including Fernando, the future king of Portugal. Pedro, however, had fallen in love with Inés de Castro, his wife's lady-in-waiting and a member of a powerful Galician family. Although Afonso IV banished Inés from his kingdom, she returned to Portugal after Constanza's death in 1345 and gave birth to four illegitimate children by Pedro. Afonso IV believed that his son Pedro was setting a bad example, neglecting his royal duties and compromising Portugal's security by falling under the influence of Galician and Castilian nobles, headed by Inés's brothers. In 1355, apparently at Afonso IV's orders, Inés was murdered. Prince Pedro, aided by Castilian forces led by the brothers of Inés de Castro, mounted a full-scale revolt against his father, but in 1356 peace returned.

AFONSO V

Twelfth king of Portugal and third of the house of Avis, 1438–1481, sometimes called “the African” because of his crusading expeditions in the Maghrib. He was born at Sintra on 15 January 1432, the eldest son of King Duarte and Queen Leonor, and acceded at the age of six. His father's will appointed his mother regent, but she was opposed as a woman and a foreigner (a Castilian, though called “of Aragón”), and lacking consent of the *cortes* (parliament). His father's younger brother Dom Pedro was backed by the towns, and after an unsuccessful dual regency, Leonor fled to Castile, apparently to her relatives. Pedro assumed the sole regency, and fended off threats of Castilian inter-

vention, but formed an alliance with the warlord Álvaro de Luna. Pedro arranged the marriage of Afonso V to his daughter Isabel, and appointed his son, also Pedro, constable. Afonso came of age at fourteen, and prolonged Pedro's authority. Pedro's costly intervention in Castile lost him support, and the intrigues of the Duke of Bragança, who claimed that the constablenesship was hereditary in his family, forced Pedro to resign. He was provoked into rebellion and killed at Alfarrobeira. Afonso V refused to put away Isabel, but could do little to curb the Braganças. In 1455 his heir Prince João was born, Queen Isabel died, and there was a reconciliation. The Portuguese voyages of exploration to West Africa under Prince Henrique had been actively pursued under Pedro, but Afonso V responded to the loss of Constantinople and the appeals of Pope Calixtus III by organizing a large crusading expedition that took al-Qaṣr aṣ' aghir (Alcácer Seguer) on 23 October 1458. It was hoped it would relieve the isolation of Ceuta, but the new conquest suffered several sieges, and then Afonso returned to Africa in 1464; he was saved from capture only by the sacrifice of Duarte de Meneses.

These costly military campaigns delayed the voyages of discovery, which had reached Serra Leoa (Sierra Leone), when Prince Henrique died in November 1460. Afonso entrusted the voyages to his younger brother Fernando, but until 1468 the main activity was in trading, with little further exploration. In 1469 Afonso awarded a monopoly of trade to Diogo Gomes, a Lisbon merchant, with the obligation to pursue the discoveries, and after the death of Fernando in 1470, the enterprise passed under the control of Prince João. By 1474, the Cape Verde Islands, the Equatorial isles and the African coast almost as far as the mouth of the Congo were made known.

Afonso was a liberal patron moved by religious idealism and somewhat outmoded notions of chivalry. His African illusions were crowned in 1471 when he led a vast fleet to take Arçila, and Tangier was abandoned without a fight. These conquests had to be supplied by sea, at considerable expense, but contributed something to the security of the seaways. Madeira, with about one thousand settlers, provided cereals and initial sugar production. The Azores, settled with some contribution from Flanders (where Afonso's aunt had married Philip the Good), produced cereals and dye-stuffs. Afonso's aristocracy, drawn mainly from families that had supported his grandfather João I, were his pensioners, drawing *moradias* at court according to rank. He resided at Lisbon, Sintra, Santarém, and Évora. He convened cortes on twenty occasions, usually at one of these places, never in the north or south of Évora. This centralizing system strengthened the

class of *letrados* emerging from the single university at Lisbon.

The Cape Verde Islands were claimed, but not yet settled. Guinea gold was obtained from Gambia from about 1458, but the supply attained large proportions with the foundation of the factory at Mina in 1481.

Afonso's personal inclination was to emulate his great-grandfather João I, whose conquest of Ceuta he commissioned Azurara to narrate. His sister Leonor married Emperor Frederick III and was the mother of Maximilian. His brother-in-law Pedro claimed to be king of Aragón (1464–1466). In 1455 his youngest sister Joana became the wife of Enrique IV of Castile, she gave birth to a princess, also Joana, whose succession was contested upon the death of Enrique in 1474, by Fernando of Aragón on behalf of his wife Isabel, Henry's sister. Supporters of Joana appealed to Afonso V, who accepted the challenge, and prepared to marry his niece and lead her partisans. He occupied the towns of Zamora and Toro, claiming the throne of Castile. He informed Louis XI, his ally, also hostile to the Aragónese, and entrusted Portugal to his son, João II. Fernando took Zamora, and after the battle of Toro (2 March 1476), Afonso decided to go to France to appeal to Louis, who received him at Tours and put him off with words. Afonso visited Paris and mainly sought help in Lorraine. He then decided to abdicate and go to Palestine, but changed his mind and returned to Portugal just as his son had begun to govern. He resumed his reign, but left João to rule. Since Fernando and Isabel were now entrenched, João concluded the Treaty of Alcáçovas (4 September 1479), by which Joana's claim was canceled, and Afonso retired to Sintra, where he died on 15 August 1481.

AFONSO, COUNT OF BARCELOS AND DUKE OF BRAGANÇA

Illegitimate son of Dom João, master of Avis, who became king of Portugal (1385) as João I, and Inês Pires, was probably born in the castle of Veiros in Alentejo, southern Portugal (ca. 1380). He was brought up in Leiria and legitimized by his father on 20 October 1391. Dom Afonso fought alongside João I in the eighteen-year-old war against Castile. In the siege of Túy

in Galicia, he was knighted by the king on 25 July 1398, after the town had surrendered. On 8 November 1401, he married Doña Beatriz Pereira de Alvim (1378–1412), the daughter of Nun' Alvares Pereira, the wealthiest nobleman in the realm, and Doña Leonor de Alvim. He received by his marriage large donations in land and property, which made up the foundation of the House of Bragança in 1442. He was the eighth Count of Barcelos and the first Duke of Bragança.

João I and the queen, Philippa of Lancaster, held him in high esteem. He visited the court frequently and was a member of the Privy Council, taking part in all affairs of state even when Duarte I succeeded his father João I to the throne. Afonso had great ambitions for his family, and though he was extremely rich and enjoyed great prestige at court, he craved political power. He believed his opportunity had come when Duarte died, leaving a six-year-old son, Afonso. But Duarte's brother, Pedro, was elected regent (1440–1446) by the *cortes* (parliament) held in Lisbon (1439), one year after the young Afonso V had been crowned. The Count of Barcelos in 1443 headed the aristocratic faction that wanted to strengthen personal privilege, and led a campaign against Pedro that led to his death at the battle of Alfarrobeira (1449). Afonso died in 1461.

AGRICULTURE

Introduction

Both Christians and Muslims practiced styles of agriculture that were distinctively Mediterranean in style and were equally based in the classical "Mediterranean triad" of wheat, olives, and grapes. On this foundation, the Arabs superimposed, particularly in the great periurban *huertas* of southern and eastern Spain, a roster of irrigated crops characteristic of "Indian agriculture" (*filāha hindiyya*) which had the effect of broadening the nutritional base of the urban Islamic population. As with all aspects of material culture in medieval Spain it is important to track continuity or change over the key cultural transitions: that of late Roman times to the early middle ages, both Christian and Islamic, and that of the eleventh through thirteenth centuries, from Islamic to Christian society.

Agriculture in medieval Iberia was strongly conditioned by its Mediterranean climate (except for the

more "continental" peninsular northwest) and by a high degree of continuity with Roman agriculture. Archaeological evidence from Islamic sites in Castellón reveals virtually no change in the pattern of cultivars from Roman through Islamic times. However, this evidence is from rural dry farming and microscale irrigated *huertas* (gardens) that do not reflect the more cosmopolitan "Indian"-style agriculture of the irrigated *huertas* of the major cities of al-Andalus.

Thus, Butzer has found that to the Roman repertory of spring wheat, millet, a dozen species of orchard trees, and a great variety of fodder and vegetable crops, the Arabs (in Castellón) added only sorghum, four fruit trees, and some crops that were important commercially but which had no influence on the practice of the majority of the peasantry.

The case for the Arabic "green revolution" is made by Watson, who stresses the other side of medieval agriculture: that of the great urban *huertas* where crops introduced from the east made an entrance, these were rice, sugarcane, cotton, a number of citrus varieties not cultivated by the Romans, the banana, watermelon, a number of important new vegetables (spinach, artichoke, and eggplant), and hard wheat. The heart of Watson's argument lies in his conception of how and when these crops were deployed, namely in the process of economic regionalization that resulted from the breakup of the caliphate into more economically coherent entities, reflected in the political organization of the "party kingdoms." The most precise cultural marker, in any case, is less the roster of crops grown by different cultural groups than the balance struck among cereal farming, irrigation, arboriculture, and stock herding.

Agriculture in Al-Andalus

The most salient aspect of Islamic irrigation in Spain was its association with the distinctive form of rural social organization, namely the complexes of castles and hamlets (*alquerías*), that had been established throughout many rural districts, especially Valencia, Murcia, Almería, and Málaga. Such systems were of Islamic foundation and (following Butzer's typology) were either microsystems (based on tanks fed from wells or small springs) or mesosystems (from large springs or small streams). The latter used a variety of water conduction techniques, including filtration galleries or surface canals. Both micro- and mesoscale irrigation were associated with terracing, an example of which is the terraced agriculture of Banyalbufar, Mallorca, a replication of the Arabian *ma'jil* regime whose introduction from Yemen in the tenth century is documented. The mesosystems of southeastern Spain and Granada are institutionally similar to oasis-

style irrigation systems of southern Arabia and the Sahara. The periurban macrosystems of the huertas of Murcia and Valencia are most likely Islamic expansions of preexisting Roman canal systems, but their existence in Islamic times has not been precisely documented.

The agricultural heartland of al-Andalus, that is the *campiña* (open country) of Córdoba and the the Guadalquivir Valley generally, had in the past constituted the wheat-producing area of Roman Baetica, one of the three breadbaskets (along with Sicily and Tunisia) of Rome. Although the data is inferential at best, we can presume that the Muslims grew less wheat than the Roman occupants of the same area had. Even though the lower Guadalquivir was in general not irrigated in Islamic times, much of the unirrigated land was put into tree crops, notably olives. Nevertheless, the Córdoba *campiña* and various places with the name *Fahs* (plain), such as Fahs al-Ballut to the north of Córdoba and Fahs Qāmara, near Colmenar, were famous for their wheat. The Arabs introduced hard wheat (*Triticum durum*) into Europe: in al-Andalus it was called *dārmaq* (in Castilian, *adārgama*). Millet, which had been the staple of the Roman working classes, was replaced by sorghum (Arabic *dhura*; *al-dora* in medieval Castilian) which the Berbers brought from the Sudan. Sorghum played the same social and dietary role as was played in Christian Spain (and Europe generally) by rye; the Muslims also cultivated rye, which they called by its Romance name, *shantiyya*. The Muslim reshuffling of the cards of cereal culture was no doubt climatically motivated: hard wheat is much more resistant to heat and drought than were the soft varieties it replaced, and sorghum was well suited to the Mediterranean climatic regime of spring rains, followed by a hot, dry summer.

Cereals and irrigated field crops were complemented by vineyards and orchards. The Quranic prohibition of wine drinking did little to stifle the growing of grapes, although some *repartimientos* (land grants) indicate that vineyards were not as widespread in areas of southern Spain, such as Seville, which were later known for their wines. The Christian and Jewish minorities, of course, constituted a continuing market for wine, and Muslims not only used grapes and raisins in their cuisine, but many drank wine as well. Malagan grapes were greatly admired, as was the *qanbanī* variety from the Córdoba *campiña*.

Roman Spain had been an exporter of olive oil, so the Muslims were by no means innovators in this area. But Andalusī cuisine was almost wholly dependent on olive oil, to the exclusion of animal fats, and the universality of the use of olive oil and olives no

doubt explains why they are known by Arabisms—*aceite*, *aceituna*, from *al-zait* and *al-zaituna*—while the tree has a Romance name, *olivo*. The Aljarafe region to the west of Seville was so densely planted in olive and fig trees that it could be traversed in the shade, and *repartimientos* suggest that there were two and a half million olive trees in the present province of Seville at the time of the conquest from the Muslims and that it produced five million kilos of olives annually.

Figs were noteworthy for the great number of varieties grown in al-Andalus, including the *rayyī* or Málaga fig the *doñeqal*, the *qūtiya* (Gothic), and so forth. The *repartimiento* of Málaga records equal numbers of fig and pomegranate trees, then a second line grouping of plum, apple, quince, lemon, and apricot, and in fewer numbers, lime, orange, peach, and pear. Almonds were also widely grown, due to the universal use of their flour as a thickener in Andalusī cooking. (Andalusī cookbooks, incidentally, are a valuable source of information about what foodstuffs were available in markets; more recipes have survived from al-Andalus than from any other medieval society.)

We know few specifics of stock raising in al-Andalus. Berber mountaineers practiced a mainly pastoral economy, along with arboriculture, and Berbers introduced the merino sheep from Morocco sometime before the fourteenth century.

Early Christian Agriculture

Tenth-century colonization in the Christian kingdoms produced a network of *aldeas*, which became the characteristic unit of peasant settlement. These were organized in two roughly concentric circles, in common with the morphology of villages all over western Europe. The inner circle was comprised of houses and closed parcels (*solares*) for private domestic agricultural exploitation. Surrounding this nucleus was an outer circle of fields, forest, or pasture. With the passage of time, the primitive *aldeas* became compacted, due to economic or demographic pressure, with the houses more tightly packed together and the *huertas* between houses in many cases squeezed out. Surrounding cereal fields and vineyards were also pressed together and something resembling the western European “open field” system emerged, with communal two-course, biennial rotations (*año y vez*) alternating plantings of winter wheat with fallowness. In areas where local stock raising was particularly strong, a further adaptation was made in the form of *cultivo al tercio*, which freed more space for fallow grazing.

Three-course rotations, with a spring sowing, could not be introduced under conditions of semiaridity on light soils where the Roman plow was used. The heavy plow, said to have been introduced by the Suevi, was known only in Galicia. Cereal yields were accordingly very low, three to one and four to one for wheat and barley, respectively, which compares unfavorably with typical northern European yields of five to one and nine to one. Oats were planted increasingly in Catalonia from the first half of the eleventh century. Both the military and agricultural use of horses were directly linked to the incidence of oat cultivation.

Cereal cultivation was complemented by vineyards, arboriculture, and herding. The diffusion of the grape was linked to monasticism and demand for wine resulted in the progressive conversion of wasteland and cereal land into vineyards until the end of the twelfth century. Grapevines became ubiquitous and, in Catalonia, terraced vineyards invaded hill country at the expense of rough pasture. Fruit trees provided an important component of a diet based on inadequate cereal stores. The Basques were associated with the apple tree; as they migrated southward the apple went with them. Figs, pears, cherries, peaches, and plums were also widely grown and, where possible, irrigated. The olive was not widely grown in Christian Spain before the tenth century and only in climatically appropriate zones, such as Catalonia, thereafter.

Irrigation was also widely developed in the Christian kingdoms. Wherever water was diverted for the milling of grain—which was practically everywhere—the diversion channels could be pressed into service for irrigating small gardens. In the early phases of settlement of sparsely populated plains such as the Duero Valley or the Plain of Vic, water as well as land was available for appropriation (*presura*). In the great age of monastic expansion (the ninth through eleventh centuries), monasteries sought riparian land both for milling and for irrigating domestic gardens. In general, vegetables grown on irrigated parcels were not commercialized in the northern kingdoms to the extent they were in al-Andalus, although by the early eleventh century, Barcelona was surrounded by *hortos subreqaneos* that produced vegetables and fruits for the urban market.

As more land was cleared for grain fields, vineyards, or orchards, less was available for the grazing of local herds. Seignorial herds tended to become transhumant while villagers were increasingly excluded from this sector. Monasteries in particular owned large herds—including the Cistercians, who ate no meat. Full transhumance did not emerge until the twelfth century when Catalan monasteries established

summer pastures in Cerdaña and when, after the capture of Toledo in 1085, the Tajo Valley was opened to northern herds.

The Later Middle Ages

The process by which a feudalized agricultural system replaced the existing Islamic regimes as the conquest of al-Andalus proceeded has been imperfectly understood until recently. In part this was because the social organization of rural al-Andalus had been so neglected by historians. Now that such organization has been conceptualized, it is possible to make some generalizations concerning the agricultural transition, particularly in the thirteenth century. First, Christian settlement and political control radically altered the *alquería* networks or destroyed them completely. In Islamic society, *alquerías* were minimally subdivided and were farmed by collectivities of individuals—extended families or their successors. Christians did not understand this kind of property regime. When *mudéjars* (Muslims living under Christian rule) remained in their *alquerías* there was pressure to establish metes and bounds and to reduce collective holds into individual ones. When Muslims were replaced by Christian settlers, a completely different tenure system was introduced. Peasant settlers were given an allotment, generally no more than nine hectares, which generally included a mixture of cereal land, huerta, and vineyard parcels. Given the extremely high mobility of frontier society and Christian inheritance rules, it took only a few decades to completely transform the agricultural landscape, giving rise to a regime characterized by dispersion of parcels. Cereal cultivation and vineyards were privileged. Feudal rents were typically collected in kind, in grain and in vine. The products of small *huertas* fell outside this fiscal system and perforce led to an expansion of grain production. That did not mean, however, that irrigation systems fell into desuetude. In general, in places like Valencia, Murcia, and Andalucía, the Muslim systems were kept going, care being taken to learn the distribution and allocation arrangements directly from Muslim irrigators. It was probably as a result of Christian settlement that the huerta macrosystems were formed by a process of the linking up of previously unconnected small *alquería* channels. This process is documented, for example, in the post-Conquest Ribera del Júcar. Prior to the Conquest *alquerías* at some distance from the river had been irrigated by springs and small streams. As the river was tapped (Acequia Real del Júcar of the late thirteenth century) and canals dug and extended, the new unified system encompassed the dispersed elements of older *alquería* systems. A similar process took

place in the plain of Castellón, where, prior to the Conquest, only Borriana and a number of separate *alquerías* had been irrigated; it may also have taken place in Valencia and Murcia, at least insofar as the extension of those *huertas* was concerned.

It is interesting to note that, with irrigation, the Christian settlers did not much alter their habitual ways of farming. It became possible, in Valencia for example, to introduce a three-course rotation, with a course of spring crops (oats, peas, beans, and barley). With irrigation it was possible to increase yields of cereals so as to enhance consumption, as well as produce the surplus needed to pay feudal dues. (Once such a surplus was generated, commercialization of the crops in question was inevitably stimulated.) Grapevines were also irrigated in medieval Valencia for the same reasons.

What specific elements of Muslim agriculture did the Christians adopt? In general terms, both the repertoire of cultivation techniques and the roster of crops were broadened. Examples of the former are the use in southern Spain of the Berber plow with moldboard (a variant of the standard Roman plow), and the diffusion of most elements of modern harnessing (except for the padded horse collar) from Tripolitania into Europe through Spain and Italy. An example of the latter is the rise of rice as a staple grain, which was only possible in climatically appropriate areas with extensive irrigation.

ALANS *See* GERMANIC INVASIONS

ALARCOS, BATTLE OF

The battle of Alarcos (19 July 1195) was a decisive victory for the Almohad caliph Ya'qūb al-Manṣūr over the Castilian king Alfonso VIII. Al-Manṣūr had mounted expeditions against Portugal in 1190 in retaliation for Portuguese expansion in the Algarve and Castilian expansion into al-Andalus. Castile then sought treaties with Al-Manṣūr, but after they expired the Castilians began campaigning around Seville. In retaliation, Al-Manṣūr crossed into Spain at Tarifa in June 1195 and took his army on the road to Toledo, camping in the lands around Calatrava.

Prior to the battle of Alarcos, Alfonso VIII had unfriendly relations with the neighboring kingdom of León and its king, his cousin Alfonso IX; in 1194, the Treaty of Tordehumos created an alliance between the two kingdoms. But when Alfonso VIII heard of Al-Manṣūr's advance, he decided not to wait for reinforcements from León. Instead, he rushed from Toledo to the fortress of Alarcos, an unfinished fortification in the vicinity of Calatrava, located to the west of the modern Ciudad Real.

Alfonso engaged the Almohad army prematurely, and the king and a portion of the army were forced to flee to Toledo. Diego López de Haro covered the king's retreat and surrendered the castle of Alarcos to Al-Manṣūr. The Almohads also captured the castle of Calatrava and other fortresses along the road to Toledo. After the battle, though, Al-Manṣūr returned to Seville and did not continue his advance toward Toledo. Contingents of the Almohad army raided around Toledo and its hinterlands; this stopped when Alfonso entered into a five-year treaty with Al-Manṣūr in 1197.

Battle losses are hard to estimate. Muslim sources provide figures ranging from 30,000 to 300,000 Christian dead versus 500 to 20,000 Muslim dead. The Order of Santiago lost nineteen friars, and numerous associates. The Order of Calatrava lost its home fortress. The bishops of Ávila, Segovia, and Sigüenza were killed.

The blame for the defeat has been assigned to various people: to Pedro Fernández de Castro for betraying Alfonso VIII by turning over his contingent to Al-Manṣūr; to Arabs within the Christian population; and even to divine retribution for a fictional affair between Alfonso VIII and a Jewish woman in Toledo. But it seems reasonable to assign the blame for the debacle to Alfonso VIII himself. Alfonso apparently seriously underestimated the number of troops he needed, as well as Al-Manṣūr's abilities, and he engaged Al-Manṣūr before the Leonese reinforcements arrived.

The battle of Alarcos was the last great Almohad victory in Spain, and marks the height of Almohad power in the Iberian Peninsula. Alarcos weakened Castile, and its relations with other Iberian kingdoms were damaged when León and Navarre temporarily allied with the Almohads. Al-Manṣūr, however, did not follow up on his opportunity to pursue Alfonso VIII and to recapture territory. Castile recovered, and Alfonso VIII reversed the defeat of Alarcos at the battle of Las Navas de Tolosa seventeen years later.

ALBALAT, PERE DE

Albalat died July 1251. Bishop of Lérida 1236–1238, archbishop of Tarragona 1238–1251. A churchman notable for his dedication to the implementation in the Crown of Aragón of the reform program of the Fourth Lateran Council (1215), Albalat summoned eight provincial assemblies during his fourteen years as archbishop and caused diocesan synods to be held by his suffragans, at which attention was given to legislation concerning clerical concubinage and pluralism, the sacraments (especially matrimony), and the enforcement of monastic discipline. He collaborated with Ramón de Penyafort and was closely attached to the Cistercian house of Poblet. During his pontificate Cistercian and Dominican influences predominated in the Aragónese hierarchy (between 1243 and 1248 five mendicant bishops were appointed); his first provincial council ordered the solemn celebration of the feast days of St. Francis, St. Dominic, and St. Anthony of Padua. His other principal mentor was Cardinal Jean d'Abbeville, legate to the peninsula 1228–1229, with whom he maintained contact into the 1230s. The so-called *Summa septem sacramentorum*, which he compiled, was based on the statutes attributed to Eudes de Sully, bishop of Paris (d. 1208). First promulgated by him at Barcelona in 1241, the *Summa* was an unsophisticated work of practical guidance for the clergy that enjoyed considerable influence throughout the province for the remainder of the century. Another side of him was revealed in the course of the *Ordinatio ecclesie Valentine*, the bitter struggle in which he engaged with Archbishop Rodrigo of Toledo for jurisdiction over the recently restored church of Valencia, and in the sometimes uneasy relationship which he maintained with King Jaime I, the "Conqueror."

ALBIGENSIAN CRUSADE, THE

On the morning of 14 January 1208, just north of Arles, where the Rhône River divides, Pierre of Castelnau—virulent Cistercian denouncer of the Cathar heresy and the papal legate who, less than a year earlier, had excommunicated Raymond VI, count of Toulouse—was brutally murdered by a swiftly thrown lance puncturing his back. The killer was an anonymous horseman who escaped to nearby Beaucaire. Pierre's quick death was the immediate cause of twenty-one years of intermittent warfare and bloody conquest known as the Albigensian Crusade.

Pope Innocent III immediately accused Raimond VI of Pierre of Castelnau's murder, and then authorized a crusade, with the same indulgences as an expedition to Palestine, against Raymond and the Cathar (or Albigensian) heretics the count was accused of supporting. Raymond may have been tolerant toward the Cathar holy men and women, known as *perfecti* and *perfectae*, and he may have expropriated some church property, but he was also intelligent enough not to jeopardize his power in Languedoc by the impetuous killing of an apostolic legate.

The king of France, Philip Augustus, displayed no apparent interest in the papal holy war—despite the personal entreaties of Innocent III. Philip did, nevertheless, allow five hundred knights to take the cross. Raymond VI endeavored to stop the crusaders by reconciling himself with the Church on 18 June 1209; unfortunately, the crusading army was already on its way, under the leadership of Arnau Amalric, abbot of Cîteaux and head of the Cistercian Order. Four days later Raymond took the cross himself and helped redirect the crusaders toward the lands of the Trencavels, vassals of Pedro II of Aragón. The town of Béziers was captured easily, and the entire population allegedly massacred. Apparently reflecting upon such indiscriminate killing, Arnau Amalric is reported to have said, "God will know his own." Carcassonne, the Trencavel capital, surrendered on 15 August and its viscount, Raymond-Roger, was imprisoned. The crusaders, ignoring the claims of Raymond-Roger's young son and the feudal authority of the Aragonese crown, appointed Simon de Montfort, a baron from the Ile-de-France and titular Earl of Leicester, as ruler of Carcassonne.

Raymond VI left the crusading army after Carcassonne, but his excommunication was renewed in a series of Church councils (1209–1211). The papal legates would not listen to any of Raymond's attempts to reconcile himself; the crusade could now continue into the territories of the Count of Toulouse. At this point, in 1212, Pedro II of Aragón, Raymond's brother-in-law and the recent victor over the Muslims at Las Navas de Tolosa, placed Toulouse under his protection. On 12 September 1213 the combined armies of Pedro and Raymond, as well as the counts of Foix and Comminges, met Simon de Montfort's little army outside the fortified village of Muret. Simon was victorious and Pedro died in the battle (with his five-year-old son son Jaime, the future king of Aragón, held captive by Simon until April 1214).

In 1215 the Fourth Lateran Council deprived Raymond VI of all his lands. The marquessate of Provence was held in trust for the future Raymond VII, while everything conquered by the crusaders was to be ruled by Simon de Montfort (including the county of Comminges). Despite all this, the war went on for another thirteen years as Raymond VI and his son struggled to regain their lost domains. Eventually, after Simon de Montfort died while besieging Toulouse in 1218—his head crushed by a stone from a catapult worked by young girls and married women—the two Raimonds slowly succeeded in their reconquest. Throughout these years, Philip Augustus remained indifferent to the plight of Simon's son, Amaury. However, after Raymond VII, Raymond-Roger of Foix, and Raymond Trencavel were all excommunicated in November 1225, Philip's son, Louis VIII, undertook a royal crusade into Languedoc. The king captured Avignon in 1226 and then proceeded to march toward Toulouse. Louis effortlessly occupied the possessions of the Trencavels along the Aude River, but before he could strengthen his position, the king died on 8 November 1226.

Raymond VII, in the lull after the death of Louis VIII, was offered the chance for peace and he gladly took it in 1229. On 12 April 1229 the Treaty of Paris officially ended the Albigensian Crusade. Yet the spiritual and secular conquest of Languedoc, unleashed so many years earlier by the murder of a papal legate, would continue for at least another four decades. The treaty's insistence on the pursuit of heresy led not only to the founding of the university in Toulouse but also to the formation of the medieval inquisition. The treaty also stressed that Raymond was now a vassal of the northern French king—emphasized by the obligation of the count's nine-year-old daughter and heir, Jeanne, to marry a brother of the king—and that the traditional territorial claims of the kings of Aragón within Lan-

guedoc, as well as the right to interfere in southern French affairs, would no longer be acceptable. The Aragonese crown finally renounced all ambitions beyond the Pyrennees with the Treaty of Corbeil in 1258 between the French king Louis IX and (the son of Pedro II captured by Simon de Montfort after the battle of Muret almost forty years earlier), Jaime I.

ALBO, JOSEPH

Aragonese rabbi of the fifteenth century, Albo represented the Jewish community of Daroca at the famous Tortosa Disputation (1413–1414), although he played apparently a minor role and was somewhat inconsistent in his statements. He was a student of the renowned leader of Aragonese-Catalan Jewry, Hasdai Crescas, and as such was certainly greatly influenced by his philosophical magnum opus, *Or Adonai (Light of the Lord)* and also by his small polemical treatise against Christianity.

Taking his cue from these works, Albo wrote a large work, *Sefer ha-Ciqarim (Book of the Principles)* on the fundamentals of revealed religion, specifically, of the Jewish religion. Critical of Maimonides for not giving the basis for his own enumeration of thirteen principles of "faith," Albo reduced these to three: existence of God, belief in revelation, and the doctrine of divine retribution. Yet he similarly failed to prove a basis for these dogmas. Notably lacking is a belief in creation, especially *ex nihilo*, which Albo held to be a necessary religious belief but not a fundamental dogma. A lack of belief in "dogmas" as supposedly found in the Bible, or an incorrect interpretation of the Bible, did not render one a heretic (as, apparently, did denial of the three fundamentals).

The belief in the messiah, which at the Disputation he had appeared to question altogether, is not to be

considered a fundamental principle but only a binding belief (which nevertheless could not logically be deduced from any of the fundamentals). A major thrust of his argument is anti-Christian polemic. While theoretically admitting the possibility of a plurality of revealed religions, he in fact limited such revelations to those pre-Mosaic figures such as Adam, Noah, and Abraham. Christianity could not be recognized as a legitimate revealed religion because of its denial of the essential unity of God.

Nevertheless, his position on divine attributes, acceptance of positive attributes (in contrast to Maimonides), was directly influenced by Thomas Aquinas. Thus, ironically, Aquinas, who was himself influenced by Maimonides on other matters, became a source for this later Jewish work attacking both Maimonides and Christianity.

In actuality, there is little either original or of profound interest in Albo's work.

ALBORNOZ, GIL ALVAREZ CARRILLO DE

Gil de Albornoz was one of the most eminent Spanish churchmen of the fourteenth century. He was born at Cuenca (ca. 1295) and was the son of García de Albornoz and Teresa de Luna. Albornoz was educated in Zaragoza under the watchful eye of his influential uncle, Jimeno, who at the time was archbishop there, and under the tutelage of Pedro Egidio, who would later become a deacon at Cuenca and come to administer Albornoz's household. In 1316 to 1317, Gil de Albornoz enrolled at the University of Toulouse, where he remained for a decade and from where before 1325 he was awarded a doctorate in decretals and canon law. While at Toulouse, he doubtless came into contact with Stephan Aubert.

Gil de Albornoz's life can be divided into two phases, an early Iberian one and a later Italian period following the accession of Pedro I to the crown of Castile and Albornoz's voluntary departure from the Iberian Peninsula. Since Albornoz's exploits in Italy are more amply known and readily accessible in many sources, greater attention will be given here to his achievements in Spain.

Upon returning to Castile from Toulouse in 1327, Gil de Albornoz joined the circle of Alfonso XI and, in addition to his ecclesiastical benefices at Cuenca, held the title of counselor to the king and archdeacon of Calatrava. By 1335 he had participated in an em-

bassy to the king of Aragón and was actively engaged in the political life of Castile. In 1338, he was named archbishop of Toledo to succeed his uncle Jimeno, who held that position when he died. Albornoz was subsequently given the secular title of canceller de Castilla. It is at this point that he began to intervene vigorously in reforming the kingdom's judicial administration and in the organization of the armed forces. His active participation in the *cortes* (parliament) of Castile show him to be a dynamic force in all manner of affairs concerning the governance of the realm. Although Albornoz's influence in the adoption of the *Ordenamiento de Alcalá* in 1348 has not been carefully studied, he was doubtless a major participant in drafting and promulgating the new legal code. At the same time, Albornoz is known to have been energetically engaged in Alfonso XI's military exploits against the Muslims in the south and was named *comisario de la cruzada* for his efforts. Albornoz was at Alfonso's side at the Battle of the Salado River (1340), at the siege and capture of Algeciras (1342–1344), and at the siege of Gibraltar until the king's untimely death from the plague in 1350.

Albornoz's activity in the Spanish Church was no less forceful than his involvement in secular government. The synods and councils of Toledo in 1339 and 1345 show him to have been especially preoccupied with the moral life of his diocese, attempting to impose order upon the disposition of ecclesiastical property and benefices, the *cura pastoralis* and administration of the sacraments by the rectors of churches and parishes, and the general reform of the clergy, which was deemed to be in a lamentable state of decadence. Clerical simony and concubinage were two lapses that especially caught Albornoz's attention, and orders against these practices went out under his name. It is because of this that Albornoz is often associated with Juan Ruiz, the putative author of the *Libro de buen amor*, whom the Salamanca manuscript of the latter attests was jailed by the bishop for his carnal failings. Quite aside from reputedly policing the celibacy of the clergy in the diocese of Toledo, Albornoz was deeply concerned with the level of their culture, learning, and education. He began his reign as archbishop by ensuring that the edicts of the Council of Valladolid (1322) be strictly observed and that one out of every ten clergymen in every deanery be commissioned to study theology and canon law, prohibiting the ordination of all who could not demonstrate an adequate level of clerical education, "ut nullus nisi litteratus ad clericatum promovetur" (unless literate, do not make him a cleric), according to the Council of Toledo of 1339. Albornoz's own fidelity to his vows and the requirements of ordination were said by all to have been exemplary.

The death of Alfonso XI led Albornoz to fear disgrace at the hands of Pedro I, the king's successor. As a result, he withdrew to the papal court at Avignon, where he was made a cardinal in December 1350. His career in the curia was as successful as it had been at the Court of Castile. He was made papal legate and vicar general of the Papal States, helping Pope Innocent VI to control firmly their administration and dominate central Italy politically. Between 1353 and 1360 Albornoz attempted to revive the Angevin-Guelph alliance of the 1320s to counter the power of the lords of Lombardy but, after great sacrifice and expenditure, he failed to pacify the Italian peninsula because of French inability to provide continued support.

Throughout his life Albornoz remained firmly committed to the education of the clergy. He was especially concerned with their preparation in canon law and ecclesiastical administration. As a result, he founded the Collegio di San Clemente, known as the Spanish College, at the University of Bologna. In the will he signed in 1364, he created the foundation to establish the college as the universal heir to his fortune and, in a codicil added in 1368, again made provisions for the disposition of his inheritance, which was to go in its entirety to support twenty-four Spanish students in the course of their studies at the university. By 1369, two years after Albornoz's death at Viterbo, the College of San Clemente received its first group of students, many of whom went on to become distinguished jurists upon completion of their studies and their return to the Iberian Peninsula. Albornoz's foundation of the Spanish College at Bologna served as a model for the subsequent development of the *colegios mayores* in Spanish universities.

ALBURQUERQUE, JUAN ALFONSO, LORD OF

A Portuguese aristocrat, born to an illegitimate son of King Dinis (1325), Juan Alfonso de Alburquerque arrived in Castile in 1328 as chief chamberlain to María, his second cousin, the Portuguese princess who

married Alfonso XI of Castile that same year. He spent most of the rest of his life in Castile. Because of his connections and a most suitable marriage to Isabel de Meneses, whose family was one of Castile's wealthiest and most influential, he became a formidable presence in the politics of the kingdom.

As chamberlain to Pedro, Alfonso XI's and María's only surviving child, Alburquerque oversaw the education of the heir and wielded considerable influence over the young prince. Alburquerque was appointed chief chancellor when Pedro, at sixteen, became king following his father's death from the plague in 1350 during the Castilian siege of Gibraltar. For the next two years, Alburquerque as first minister was the chief architect of the crown's policies, many of which contributed to the king's future reputation and his sobriquet "the Cruel."

One policy attributable to Alburquerque's influence was the imprisonment and death of Leonor de Guzmán, Alfonso XI's favorite and mother of the future Trastámara dynasty. The elimination of Leonor caused the enmity of her numerous children, among them Enrique de Trastámara, and marked the beginning of Pedro's difficulties that culminated in the Castilian civil war of 1366–1369. Alburquerque presided over the defeat of Alfonso Fernández Coronel, a former vassal of Alfonso XI who opposed Alburquerque's policies. When Coronel surrendered in 1353 after a two-year siege, he spoke to Alburquerque in words that foreshadowed the first minister's own fate: "This is Castile, Lord Juan Alfonso; it makes men only to waste them."

The most costly of his policies, however, was his decision, along with Queen María's, to negotiate the marriage between Pedro and the French princess, Blanche de Borbón. When Pedro abandoned her two days after the wedding in 1353, likely because of the princess' inability to pay the agreed-upon dowry, the first minister failed to persuade the king to return to her side. While the marriage was intended to promote good relations between Castile and France, Pedro's rejection of Blanche served to alienate the French crown, whose participation in Castilian affairs led to Pedro's eventual defeat by Enrique de Trastámara. It was also in Alburquerque's household that Pedro met and fell in love with María de Padilla in 1352, a lasting attachment that might also have contributed to Pedro's reluctance to cohabit with Blanche.

Pedro's behavior caused considerable turmoil and opposition and unified his enemies. Queen María and Alburquerque were unable to convince him to resume normal relations with Blanche, which served to alienate them from the king. At the same time, the minister's influence had begun to wane as María de Padilla's

relatives gained ascendancy with Pedro. Albuquerque fled to Portugal and refused to return to Castile even after Pedro summoned him. When he returned, he did so as the ally of Enrique and Fadrique, Pedro's half-brothers who had temporarily made peace with the king and had been sent in pursuit of the minister. Albuquerque and his pursuers decided to make peace among themselves and march against Pedro instead. On 28 September 1354, Juan Alfonso de Albuquerque, while on campaign, died under mysterious circumstances; it was believed that he was poisoned by an Italian physician in Pedro's employ. Albuquerque's allies, who continued their rebellion against Pedro, added the minister's death to their list of grievances against the king and adopted his corpse as their standard, pledging to parade the body until they could proclaim victory. At this stage of his reign, however, Pedro was able to defeat the conspiracy against him and the rebels eventually disbanded.

Albuquerque and his wife Isabel de Meneses had one son, Martín Gil, whose death in 1365 marked the end of the family line.

ALCÁZOVAS, TREATIES OF

When Enrique IV of Castile died (11 December 1474), his sister Isabel and her husband Fernando were proclaimed as rulers of Castile, but a faction among the nobility, with the help of Afonso V of Portugal, upheld the rights to the succession of Juana, the daughter of Enrique and Juana of Portugal. The adherence of the Castilian nobility and of the cities, as well as military victories (Toro, 1 March 1476, La Albufera, 24 February 1479), secured the throne for Isabel and Fernando. Afonso V, urged by his son and heir, João, and by the majority opinion among his courtiers, had to begin the negotiations for peace that culminated in the four Treaties of Alcázovas (4 September 1479). They confirmed the peace of Almeirim (27 January 1432) in all its clauses, promising the mutual restoration of conquests and prisoners and reserving zones of influence in the Atlantic: the Canary Islands for Castile, the Azores and Madeira for Portugal. The Portuguese would have the exclusive right to navigate and occupy lands south of Cape Bojador on the route to Guinea, and the right of conquest in the emirate of Fez, except on the sliver of coastline between Capes Nun and Bojador reserved

for Castile. Juana's situation was also resolved, as she preferred to enter a convent, although during her novitiate year she could still choose another solution—namely, to marry Prince Juan of Castile, the son and heir of Isabel and Fernando; she did not do so. The future marriage of Infanta Isabel, a daughter of the Castilian monarchs, with Afonso, the son and heir of Prince João of Portugal was also proposed. The Infanta would have a dowry of 106,000 *doblas*. Both she and Juana would remain in the fortress of Moura for two years, as a guarantee that the treaties would be carried out. Juana then made her profession as a nun in the convent of Santa Clara of Coimbra (15 November 1480). Finally, those Castilians who still followed Afonso V were assured of pardon and restitution of property and offices. Thus the war was brought to an end and a very solid plan for friendly relations between Portugal and Castile was outlined.

ALCALÁ DE HENARES, ORDENAMIENTO OF

Alfonso XI determined to try to bring order to the legal chaos of his kingdom and to the widespread anarchy and outrages against justice being committed, and in 1348 at the *cortes* (parliament) of Alcalá de Henares the new *ordenamiento* (ordinance; legal compilation) was adopted for uniform use throughout the kingdom. Unlike the *Siete Partidas* composed by jurists for Alfonso X, the Ordenamiento de Alcalá de Henares was intended to be not a theoretical treatise on law but a practical application for the use of jurists. The code drew upon previous legislation: the Ordenamiento of Villa Real in 1346, and that of Segovia (still unpublished) in 1347, both of which determined primarily judicial procedures for civil and criminal matters, and included also the laws of Alfonso VIII at the cortes of Nájera in 1138, with regard to the rights and duties of the nobility, judges, treason, and so on. The *ordenamiento* was confirmed by all successive monarchs and continued to play a prominent role in the legislation of the Catholic Monarchs and even beyond.

Various unsatisfactory efforts have been made to identify the legal advisers responsible for the text, with Juan Manuel being a likely candidate and Cardinal Gil de Albornoz a less likely one.

The Ordenamiento is also important in the history of the Jews in Spain, for it was the first attempt in Castile to severely restrict their economic activity, not

only with regard to lending money on interest (of importance here is also the so-called pseudo Ordenamiento of Alcalá, said to be merely the preliminary section of the *Leyes Nuevas*, but in fact it is not; rather, it purports to be a law of Alfonso XI concerning usury), but also in that while recognizing the right of Jews to buy and sell property in the kingdom it sought to impose geographic restrictions on such property as well as restrictions on its value. It may easily be shown that these efforts were without any significant or lasting result, however.

The text of the Ordenamiento has been frequently published; see, for example, *Cortes de los antiguos reinos de León y Castilla*, volume I, and *Códigos españoles*, volume 1.

ALCAÑICES, TREATY OF

The Treaty of Alcañices (12 September 1297) established the border between Castile and Portugal. During the minority of Fernando IV of Castile (1295–1312), Dinis of Portugal (1279–1325) allied with Jaime II of Aragón (1291–1327) to invade León-Castile and to divide it between Infante Juan and Alfonso de la Cerda. Jaime II planned to take Murcia, and Dinis hoped to expand Portugal's frontiers into Castile. At the same time Muḥammad II of Granada (1273–1302) besieged Tarifa.

The invasion took place in 1296 and succeeded almost according to plan. Jaime successfully captured the major cities in Murcia, and both Juan and Alfonso were proclaimed kings, the former of León, the latter of Castile. However, Tarifa withstood the siege and Dinis, facing a rebellion by his younger brother Afonso, made a separate treaty with Castile in 1297. Under this treaty of Alcañices Castile ceded various villages and castles in the Riba Coa: Sabugal, Castelo Rodrigo, Vila Maior, Castelo Bom, Almeida, Castelo Melhor, Monforte, Olivença, Ouguela, Campo Maior, and San Félix, and received in return Aroche and Aracena. The treaty also arranged for the marriage of Fernando IV with Constança, daughter of Dinis, and of Dinis's son, the future Afonso IV (1325–1357), with Fernando's sister Beatriz. The signing of the treaty broke the coalition between Portugal and Aragón, permitting Castile to defeat Aragón and to establish Fernando on the throne. The delineation of the border

between Castile and Portugal is considered one of the achievements of Dinis's reign.

ALCÁNTARA, ORDER OF *See* MILITARY ORDERS

ALCHEMY

The history of alchemy in medieval Spain parallels in many respects the development of alchemical theory and practices in the rest of Europe, with two notable differences: (1) alchemy was practiced in the Arabic cultures of al-Andalus long before its introduction into the rest of Europe, and (2) most of the alchemical texts were translated from Arabic to Latin in Toledo in the twelfth and thirteenth centuries. It is possible the translators had contact with known Arabic experts, and the medieval practitioners in Hispanic regions may have been influenced even later by direct contact with Muslim adepts native to the Iberian Peninsula. Toledo and Salamanca became well-known in medieval Europe as centers for the study of magic and occult arts.

Alchemical theory was developed by Hellenistic scholars who lived, wrote, and experimented mainly in Alexandria. Alchemical writings described a hodgepodge of attempts to create false metals, experiments with the properties of metals, and theories of transmutations of the metals that had been elaborated from various elements of Aristotelian science. The theory of the transmutations of the metals in a hierarchical scheme in which a metal of a lower order was transformed into one of higher order was an innovation of Alexandrian scientists, whose writings were, through the Arabic translations, to be the basis of chemical and alchemical ideas well into the eighteenth century. In contrast, Latin writers, such as Pliny and Isidore of Seville, assumed gold was simply a metal deposited in the earth.

Alchemy introduced an alternative idea by which the metals were conceived of in a biological metaphor of growth and decay through which in a natural process in the earth the metals grew slowly as plants from the basest metal (lead) through the other metals to the most precious (gold). The laboratory alchemist simply tried to accelerate this process in a chemical flask. Alchemy was not only a scheme for achieving great wealth quickly, but it also became the established scientific

explanation for the formation of metals in the earth. Of lesser importance in the Middle Ages were the spiritual initiations and purifications that the adept needed to undergo for the completion of the great work.

The medical and scientific research of late Greek culture became the basis of Arabic scientific research. The translation of Greek texts into Arabic in the eighth and ninth centuries was followed by intense activity among adepts in Islamic nations, which has lasted until the present day. Records show alchemical practitioners flourished in al-Andalus during the reign of Al-Ḥakam II (961–967). Especially noteworthy among the writers in medieval Spain was the astronomer Maslamah Ibn Ahmad al-Majrīṭī (first half of eleventh century), to whom an alchemical treatise, *The Sage's Steps*, was attributed. His treatise on magic was translated in 1256 and circulated in Europe as *Picatrix*. His disciple Ibn Bishrūn also practiced alchemy.

In the twelfth and thirteenth centuries, Toledo became one of the most important centers for the translation and diffusion of Arabic scientific and medical writings to Christian Europe. Numerous scholars came from northern Europe to translate the texts from Arabic to Latin. This cultural bridge to the rest of Europe made Spain noteworthy as a center for the study of occult sciences.

The two names most often associated with alchemy in medieval Spain are the Catalans Raimon Llull (ca. 1232–1315) and Arnau de Vilanova (1235?–1313). That either of these prolific writers was the author of the symbolical alchemical treatises attributed them is still doubted. Llull, who in his authentic works denies the possibility of transforming one metal into another, is a specially difficult case, since his great works on science, designed to convert Arabs to Christianity, became the basis of magic and alchemical thought in the Renaissance and later. The most important treatises ascribed to Llull are the *Clavicula* (*Little Key*) and *Testamentum*. A host of treatises have been attributed to Arnau de Vilanova, the most influential being *Semita Semitae* (*The Path of Paths*) and *Rosarium philosophorum* (*The Rosary of the Philosophers*).

In Castile, important figures associated with alchemy were Alfonso el Sabio, and in the fifteenth century Enrique de Villena, and Alfonso Carrillo, Archbishop of Toledo. Attributed to Alfonso el Sabio is the *Libro del Tesoro* (*Book of Treasure*) and to Enrique de Villena the answer to the *Carta de los veinte sabios cordoveses* (*Letter from the Twenty Sages of Córdoba*); both texts in Luanco's *La Alquimia en España*. Alfonso Carrillo left no writings, but his obsession with alchemy was reported by Hernando de Pulgar.

Possibly writers ascribed their alchemical treatises to various famous medieval figures such as Llull, Al-

fonso el Sabio, Arnau de Vilanova, and St. Thomas Aquinas to avoid prosecution by the Church, which had taken an active role in prohibiting alchemical transmutations. Even though the attributions of many of the Spanish treatises are of doubtful authenticity, the treatises themselves were well read and very influential. The numerous medieval alchemical texts found in Spain describe the secret processes and recipes with the same types of highly symbolic and coded language typical of alchemical treatises in the rest of Europe.

ALFARROBEIRA, BATTLE OF

In which the former regent of Portugal, Dom Pedro, Duke of Coimbra, met his death at the hands of the royal army of the boy-king Afonso V, manipulated by Pedro's half-brother Afonso, Duke of Bragança. The Alfarrobeira is a stream near Alverca twenty miles north of Lisbon, and the battle was fought on 20 May 1449. Dom Pedro's brother King Duarte had died in September 1438, his heir Afonso V being only six years old. The regency of his widow was abrogated as a woman and a Castilian, and when Pedro replaced her with the consent of the *cortes* (parliament), she fled to Castile and appealed to her family. Pedro's costly intervention in Castile lost him the support of the towns, and the marriage of his daughter to the king and appointment of his son, also Pedro, to the constablenesship, which Bragança regarded as hereditary in his family, the most powerful in Portugal. When Afonso V reached his majority in January 1448, he prolonged his regency, but was at length obliged to relinquish it. When the crown demanded a review of rewards by and to Pedro, the former regent was faced with the choice between resistance and spoliation. His counselors, meeting at Coimbra, favored conciliation, but his long-time crony Alvaro Díaz de Almada, Count of Avranches, recommended a heroic defense of honor. They may have hoped for support from Lisbon, toward which they marched. They faced overwhelming odds,

and Pedro was killed by an arrow to the heart, Avranches dying soon after.

The case is analyzed in great detail by H. Vaquero Moreno in *A Batalha de Alfarrobeira*, which shows that Pedro's 480 known supporters were adherents from the duchy of Coimbra and his forty-five nobles, disposing of the supposition that he had remained the leader of the bourgeoisie. His tragic end arose from his chivalrous ideals and from the influence of Alvaro Díaz, who mistakenly thought that he could and should exercise the authority of his powerful father, Juan I.

ALFONSO DE LA CERDA

Alfonso de la Cerda, (1271–1334?) oldest son of Fernando de la Cerda and Blanche of France, grandson of Alfonso X (1252–1284), became Alfonso X's legal heir when his father died suddenly in August 1275. Alfonso X acknowledged his second son, Sancho, as his heir in the *cortes* (parliament) of 1276, but a faction led by Juan Núñez de Lara supported Alfonso de la Cerda's claim. In January 1277 Blanche and Queen Violante brought Alfonso and his younger brother Fernando, known as the Infantes de la Cerda, to Aragón for safety. Violante's brother, Pedro III of Aragón (1276–1285), later imprisoned the two boys at Sancho's request. Alfonso X disinherited Sancho in 1282 and recognized Alfonso de la Cerda as his heir, but Sancho seized the entire kingdom when the king died in 1284. Four years later Alfonso III of Aragón (1285–1291) released Alfonso de la Cerda and had him proclaimed king of Castile in Jaca. The Aragonese invaded Castile to support Alfonso and to obtain Murcia, but when this failed Alfonso went to France in a futile attempt to seek aid there. Not until Sancho died in 1295, leaving as king a technically illegitimate minor (Fernando IV, 1295–1312) did Alfonso's claim seem feasible to foreign monarchs. Alfonso invaded Castile with Aragonese help and was crowned king of Castile at Jaén in 1296, but the Aragonese withdrew and the papal declaration of Fernando's legitimacy in 1301 forced Alfonso to quit his claims. Alfonso unsuccessfully reasserted his rights again when Fernando IV died in 1312. He finally renounced his claims in 1331, when he took an oath of fealty to Alfonso XI of Castile (1312–1350) and received several lordships in return.

Alfonso de la Cerda married Mafalda de Narbona. Their children were Luis de la Cerda, Juan Alfonso de la Cerda, Alfonso de España, Margarita de la Cerda, Inés de la Cerda, and Maria de la Cerda. Alfonso's date of death is uncertain; it was either 1333 or 1334. He and his wife were buried in the monastery of Nuestra Señora del Carmen, which they founded in the town of Gibraltón.

ALFONSO DE TOLEDO

Mid-fifteenth-century author of the *Inventionario*, a catalog of discoverers finished around 1467 and dedicated to Alfonso Carrillo, Archbishop of Toledo. According to autobiographical references gleaned from the *Inventionario*, the author was born in Toledo, resided in Cuenca, held the degree of *Bachiller en Decretos*, and had earlier compiled an *Espejo de las Historias* (now lost) for the Bishop of Cuenca.

The *Inventionario* is evidently the earliest example of *heuremata* literature in any of the medieval vernacular languages of western Europe. In two books of ten *titulos* each, Alfonso de Toledo purports to list the discoverers (*inventores*) of things necessary for humankind's well-being, temporal (book 1) as well as spiritual (book 2). Book 1 discusses the discoverers of letters; kingdoms and kings; laws; cities; marriage; bread, wine, and meat; clothing; arms and martial arts; music and games; medicine; astrology; and other arts. Book 2 deals with the remedies for original sin; faith; prayer; offerings; fasting; priests and sacrifices; feast days; martyrs and religions; places of worship; and penance. There are frequent (and often interesting) amplifications and digressions.

The *Inventionario* is written in the Latinate style widely cultivated in fifteenth-century Castilian prose.

In its intent and organizational plan it resembles the *Etymologiae* of Isidore of Seville (one of Alfonso's primary *auctoritates*). The author also drew extensively from the writings of church historians, biblical commentators, and specialists in canon law, documenting his sources with particular care.

Though now nearly forgotten, the work must have circulated widely in its time; at least fourteen manuscript versions survived to the eighteenth century, and twelve are extant today.

ALFONSO I, KING OF ARAGÓN

Alfonso I of Aragón, el Batallador, was born (ca. 1073) to Sancho Ramírez, king of Aragón (reigned 1064–1094), and Felicia of Roucy. He established a reputation for military prowess, commanding the Aragonese vanguard at the Battle of Alcoraz (1096) and fighting alongside El Cid in the Battle of Bairén (1097). After his brother's unexpected death without descent in 1104, he continued the Aragonese offensive against the Muslims with substantial success. When Alfonso VI of Castile, having lost his only son in battle, sought a husband for his daughter, the heiress Urraca, his choice fell upon Alfonso of Aragón as the most able candidate.

Alfonso VI of Castile died 30 June 1109, and Urraca and Alfonso of Aragón were married in the autumn of the same year. The marriage conditions provided for joint rule of the realms of each, and provided for the succession of their descent to the united realms. The arrangement might have led to an early unification of Christian Spain, but there were many opponents to the marriage and little compatibility between the royal couple. Alfonso fought to establish his authority both over the lands of León-Castile and his wife, but finally abandoned his efforts. In about 1114, he repudiated Urraca and turned his attention increasingly to Aragonese affairs and the work of reconquest.

Gathering many French friends and relatives to his cause, he laid siege to Zaragoza, which capitulated on 18 December 1118. Tudela followed in February 1119, and Tarazona shortly after. Alfonso then marched on Calatayud and decisively defeated the

Muslims in the battle of Cutanda, 17 June 1120. He then devoted himself to the difficult task of organizing and populating the extensive territories he had acquired. From September 1124 to about May 1125, he undertook a massive raid through Valencia, Murcia, Córdoba, and Granada, and succeeded in leading a large number of Mozarabs back to Aragón. In June 1127, he concluded a treaty with Alfonso VII of León-Castile at Támara, recognizing the young king's hereditary rights and freeing himself for new conquests.

He conquered Molina in December 1128 and attacked Valencia in spring 1129, at which time he defeated the Muslims in the battle of Cullera. From October 1130 to October 1131, he engaged in an unexplained and unsuccessful siege of Bayonne, where he issued his testament, leaving his realms to the crusading orders of the Temple, Hospital, and Holy Sepulcher. He undertook the siege of Fraga in the summer of 1133, and suffered a disastrous defeat there on 17 July 1134. Alfonso survived the battle and attempted to regroup his forces, but to no avail. He fell ill, died on 7 September 1134, and was buried at Montearagón, near Huesca. His brother, Ramiro el Monje, was immediately proclaimed king, and the kingdom that Alfonso had built began to disintegrate.

Alfonso's accomplishments were many. He greatly increased Aragón's power, expanded its territories, populated its lands, and inspired its armies with the spirit of the Crusade. Many refused to believe that he had died, and legends soon sprang up that he would return someday to lead the Aragonese to victories again.

ALFONSO II, KING OF ARAGÓN

The future Alfonso II of Aragón (Alfons I of Catalonia) known as "el Casto," was born in March 1157 to Ramón Berenguer IV, Count of Barcelona (1131–1162), and Petronilla, heiress to the kingdom of Aragón. His father died on 7 August 1162, and Alfonso was proclaimed Count of Barcelona on 24 February 1163. Petronilla renounced her royal dignity in favor of her son on 18 June 1164, and Alfonso was crowned king of Aragón at Zaragoza on 11 November 1164. The Crown of Aragón was formally established with this union of Aragón and Catalonia. Although by

the terms of his father's will Alfonso was under the guardianship of Henry II of England, effective administration of the realm was in the able hands of Guillem Ramón de Moncada and Guillem Torroja.

With the death of Ramón Berenguer III, Count of Provence, in 1166, the Aragonese leaders seized the opportunity to reclaim for the main branch of the House of Barcelona sovereignty over Provence. By so doing they entered into conflict with Raymond V, Count of Toulouse, husband of the heiress of Provence. Alfonso was to remain embroiled in the tumultuous politics of the Midi for the next thirty years. These concerns generally dictated Alfonso's peninsular policies, and some historians would argue that he sacrificed advantages in the peninsula in order to advance his trans-Pyrenean interests.

In late 1173, Guillem de Moncada and Petronilla died, and Alfonso began to rule directly. In January 1174, he married Sancha of Castile and began to contemplate the conquest of the Muslim kingdom of Valencia. This venture was frustrated by war with Sancho IV of Navarre, however, and Alfonso began to draw even closer to Castile. In March 1179, Alfonso of Aragón and Alfonso VIII of Castile met at Cazorla and entered into a treaty in which they allied against Navarre and in which Alfonso of Aragón agreed that Murcia should be part of the Castilian zone of reconquest. By 1185, his peninsular frontiers were reasonably secure, and he undertook the solidification of his position in the Midi. He took Provence under his direct rule, and brought Béarn, Béziers, Bigorre, and Carcassonne into alliance or vassalage.

In 1189, his situation changed unfavorably. Alfonso of Castile entered into an alliance with Frederick Barbarossa, who contemplated returning the county of Provence to direct homage to the Holy Roman Empire, a policy that was to continue under Emperor Henry VI. Alfonso of Aragón broke with Castile and, by 1191, had brought Navarre, León, and Portugal into an anti-Castilian alliance. The Almohad invasion and the defeat of Castilian forces in the Battle of Alarcos (1195) prompted the pope to appeal for Christian unity in the face of this perceived new Muslim menace. During a celebrated pilgrimage to Santiago de Compostela (late 1195–early 1196), Alfonso brought about such unity and laid plans for a crusade against the invaders. His design failed, however. While traveling to his possessions in the Midi, he fell ill, and died at Perpignan 25 April 1096 at the age of forty.

During the reign of Alfonso II, the union of Aragón and Catalonia was established, and the institutions of the Crown of Aragón developed. At the time of his death, the Crown of Aragón was close to becoming a Pyrenean state, interposed between the great powers

of France and Castile. In the Iberian Peninsula, it had begun to exercise a role of real leadership among the Christian states. These were substantial accomplishments, but they vanished in the aftermath of the intervention of Pedro II in the Albigensian Crusade and his defeat and death in the Battle of Muret (1213). The reputation of Alfonso II has suffered by the squandering of the opportunities he created.

ALFONSO III, KING OF ARAGÓN

King of Aragón and Valencia (born, 1236; ruled 1285–1291), son of Pedro III "the Great" and Constanza of Hohenstaufen, Alfonso spent most of his short reign contending, largely successfully, with the political implications of the territorial expansion of the crown begun during the reign of his grandfather, Jaime I (1213–1276), and continued by his father. He inherited not only the peninsular Aragonese territories of Aragón, Catalonia, and Valencia but also papal censure resulting from the seizure of Sicily, his mother's legacy, which his brother and successor, Jaime, inherited and ruled. As if this were not enough, he also inherited disgruntled barons who complained that Pedro's royalist reforms had fundamentally changed the constitution of Aragonese government. Alfonso came to the throne at a moment of political instability. He was in Mallorca at his father's death, in the process of completing the annexation of Mallorca to the Aragonese crown (Ibiza and Minorca followed soon after), and immediately upon his return, in April 1286, was crowned in Zaragoza. His first concern was to pacify the coalition of nobles, newly united with key towns, who had received concessions from Pedro III in 1283 and were determined to negotiate a greater role in royal government. Rather than risk civil war, and believing that Mediterranean expansion mattered more than royal prerogatives, Alfonso made peace with his subjects. In 1287 he granted them the privilege of convoking an annual assembly and pledged to uphold certain key legal protections. He then turned his attention to the problem of Sicily and faced a formidable alliance of hostile Angevins—led by Charles of Valois, who had been deprived of Sicily and in retaliation was designated papal candidate for the Aragonese throne—and their allies, Pope Martin IV and King Philippe IV of France. The political situation, already complicated, worsened

after 1288 when King Sancho IV of Castile allied with France against Alfonso; the Infantes de la Cerda (Castilian princes) from Sancho's first marriage, and Charles of Salerno, the king of Naples and son of Charles of Valois, were caught in the middle of the fracas and taken as hostages. Warfare erupted along the border between Castile and Aragón. Alfonso realized the necessity of detaching Aragonese interests from direct involvement in Sicily and agreed at Tarascón, mediated by Edward I of England, to make peace with the Angevins, the pope, and the French. Both sides compromised: the pope agreed to lift his censure and revoke his donation of the kingdom to Charles of Valois; in return, Alfonso agreed to withdraw all support for his brother in Sicily and pledge loyalty to the pope. As part of an alliance with England, Alfonso agreed to marry Edward's daughter Eleanor, but his death just a few months later, in June 1291, rendered both that marriage and the treaty inoperative. He left no heirs, although he may have had an illegitimate son, and it was therefore up to his resourceful brother and successor, Jaime II, to resolve the matter.

ALFONSO III, KING OF ASTURIAS

The long reign of Alfonso III (866–910) marks the most brilliant period of the Asturian realm. Taking advantage of the contemporary weakness of Muslim Andalusia, Alfonso continued the work of his father, Ordoño I (850–866), in the repopulation of the northern half of the Duero River basin, founding Zamora and Toro on its banks. Farther east, Burgos was founded in 884 and control over Álava was maintained despite Basque revolts. On the western frontier, the Christian repopulation was pushed south from southern Galicia with foundations at Braga, Oporto, Viseu, and even Coimbra. The king raided as far south as the lands of Badajoz and Mérida.

All of this growth occurred despite serious internal stress at one time or another. At the very beginning of his reign Alfonso had had to take refuge in Castile when a Count Froila of Galicia had briefly claimed to succeed Ordoño. He also had to face a conspiracy of

his brother, Vermudo, who was taken and blinded but nevertheless subsequently staged a rebellion in Astorga that endured for roughly seven years and attracted Muslim support.

In fact, Alfonso's successes were such that he seems to have inspired his own, official history. As we now have them, there are three chronicles of the cycle of Alfonso III. One of them derives from Oviedo and the other two from the Navarrese see of Roda and the Navarrese monastery of Albelda; all of them stand in the same tradition; that is, they make the monarchy of Asturias the lineal descendant of the vanished Visigothic kingdom of the sixth and seventh centuries whose destiny it is to reclaim Iberia from the Muslims. In fact, these chronicles are also quite closely associated with those materials jointly described as the *Prophetic Chronicle*. The latter predicted the complete expulsion of the Muslims to occur in 884. These traditions likely antedate the reign of Alfonso himself, but the extent of his achievement and recognition is indicated by their association with him.

Certainly the king himself promoted such traditions, if he did not actually compose the earliest version of the chronicles, as has been asserted. He took pains to reassociate the kingdom with the growing shrine church of Santiago at Compostela. There he had the old church of Alfonso II (791–842) razed and a more splendid one erected. He built a new palace in the royal city of Oviedo. The king also commissioned a distinctive art in architecture and jewelry, the latter being represented by the magnificent "Cross of Victory" of Oviedo.

ALFONSO IV, KING OF ARAGÓN

King Alfonso IV of Aragón and Valencia (born 1299; ruled 1327–1336), known as "the Benign," was the second son of Jaime II and Blanca of Naples. He was named his father's successor when his elder brother Jaime repudiated his bride on his wedding day, renounced his right to succession, and joined a monastic military order. Alfonso was an able replacement, however, and well suited for governance. In 1322, as a young prince, his father sent him to Sardinia with a force of roughly fifteen thousand Catalans and Aragonese to bring the island under Aragonese control. He successfully fended off opposition from the Genoese, but the threat continued for decades and thwarted

his plans to annex Corsica. His personal reign began with abundant optimism and an opulent coronation on Easter Sunday 1328, and he gained his reputation for benevolence partly from his good sense in remaining outside the chaotic fray of politics on the Iberian Peninsula and focusing his attentions on protecting the frontiers, aiding Castile in the defense of the Strait of Gibraltar, and protecting Aragonese privileges in Sardinia. Nevertheless, all of this was overshadowed by his own ill health and the long-term consequences of the death of his first wife, Teresa d'Entença, just before the death of his father. In 1329 he married Leonor of Castile, the woman spurned by his elder brother Jaime. The marriage was intended to cement an alliance of Castile and Aragón in order to fight the Muslims in Granada, but it resulted in an intense and bitter rivalry between his eldest son and heir, Pedro (later Pedro IV, the Ceremonious), and Leonor over her desire to endow her own sons, Fernando and Juan, at the expense of Pedro. To please his wife, Alfonso was obliged to sidestep the act of union, enacted at the *cortes* (parliament) of Tarragona in 1319, that prohibited alienation of royal patrimony. He created the marquisate of Tortosa for Fernando, and later added Alicante, Elche, Orihuela, Albarracín, and other towns in Valencia, an action that enraged the Valencians, who vociferously protested the partition of the realms, arguing that it left them vulnerable to attack from Castile. He later revoked this act, noting that such royal high-handedness was not in keeping with Aragonese kingship and governance. Both the conflict with Castile and bitter antagonism between Leonor and Pedro continued beyond Alfonso's death in 1336, however, and ended with Pedro ordering the execution of Fernando in 1363.

ALFONSO IX, KING OF LEÓN

Son of Fernando II and the Portuguese *infanta* (princess) Urraca, daughter of Afonso I Henriques, whose marriage had subsequently been annulled by papal authority. The seventeen-year-old heir acceded to the throne in January 1088. Threatened on the one side by

the claims of his stepmother, Urraca López de Haro, for her own child, and on the other by the ambitions of his cousin, Alfonso VIII of Castile (1158–1214), Alfonso took the novel step of summoning to the royal curia in León in April 1188 not only the usual prelates and nobles but also men chosen by some of the towns of the kingdom to speak in their behalf. The *cortes* (parliament) of León that resulted are usually credited, therefore, as being the first known medieval parliament. In that meeting in return for its support, Alfonso agreed not to make war or peace without consultation and to himself obey the laws of the realm. In subsequent *cortes* at Benavente in 1202 he agreed not to issue a new coinage for a period of seven years in return for a grant in aid.

While immediately provoked by the succession crisis of 1188, the novel inclusion of burgher representatives of the towns in the *cortes* of the realm is a measure of the stature they had achieved in the course of the twelfth century. Overseas trade in important quantities was now reaching the northern coast of Iberia through Gijón and La Coruña. The new king would find almost constant occupation in the adjudication of conflicts between town councils and bishops or abbots in Sahagún, in Lugo, and in Túy. He was also to be kept busy reworking or granting *fueros* (privileges) to town councils in Castroverde, Sanabria, Mansilla, Oviedo, Zamora, and Toro in the north and to Salamanca, Cáceres, and Alcántara in the south. In 1204 *cortes* at León made town councils responsible for the maintenance of public order in their surrounding countryside.

But despite the support of the *cortes* in 1188, Alfonso found himself forced to attend his uncle's curia at Carrión de los Condes in June 1188 where Alfonso VIII personally knighted his cousin and exacted his homage in return. The new king determined to escape from this subjection and in 1191 found an ally in Sancho I of Portugal (1185–1211) whose daughter, Teresa, he married that same year. The two kings then joined further with Alfonso II of Aragón-Barcelona (1162–1196) in a general anti-Castilian alliance, Alfonso IX going so far as to conclude a truce with the Muslim Muwāhhid. The papacy reacted strongly against the ensuing war of Christian against Christian in the Iberian Peninsula and the papal legate Cardinal Gregory forced Alfonso to separate from his cousin, Teresa of Portugal. The kings of Castile and León then agreed in 1194 to a treaty at Tordehumos by which León would be reunited with Castile if Alfonso IX should die without heirs.

When in July 1195 Alfonso VIII of Castile was defeated in a great battle at Alarcos by the Muwāhhid caliph, Abū Yūsuf Ya'qūb, Alfonso of León reacted

in 1196 by invading Castile with the aid of some troops furnished by the Muslim. Pope Celestine III excommunicated him. Nevertheless, a solution was provided by Eleanor, wife of Alfonso VIII, who arranged the marriage of their daughter, Berenguela, to Alfonso IX of León in Valladolid in 1197. With the bride, as dowry, went the border territories in dispute between the two monarchs. However, this new marriage between cousins would also be declared null and the principals excommunicated by Pope Innocent III. Nevertheless, the royal match was maintained until 1204 in the face of papal objections. By that time it had produced four children, including the Fernando, who would succeed first to Castile (1217–1252) and then to León as well (1230–1252).

The dissolution of the marriage reopened the border question between León and Castile and kept bad feeling alive amid marching and countermarching interspersed with truces. The result was that León would remain aloof from the great Castilian victory that would lead to the eventual fall of the Muwāhhid Empire in Iberia at Las Navas de Tolosa in July 1212. Alfonso IX was busy on the Portuguese border, where he defeated the forces of their new king, Afonso II (1211–1223), at Valdevez in 1211. During the Castilian campaign itself the Leonese king seized several border fortresses while the Castilians were occupied in the south. Only in November 1212 did the kings of Castile, León, and Portugal sign a truce at Coimbra by which they agreed to cooperate against the Muslims. In the following year Alfonso IX proceeded to the definitive reconquest of Alcántara.

In 1214 Alfonso VIII died, leaving an eleven-year-old son, Enrique, as heir. The next three years saw a continuing struggle to manipulate his person and government in which the contestants were his older sister, Berenguela; Count Alvaro Núñez de Lara; and Alfonso IX of León. No faction managed to gain a decisive advantage, and then the young king died in a domestic accident in 1217. Before Alfonso IX could learn of Enrique's death, agents of Berenguela traveled to the court of the Leonese king and secured the latter's permission to allow his own son by Berenguela, Fernando, to travel to Castile to visit his mother and his cousin. Once Fernando reached Castile, Berenguela hastily arranged a *cortes* in Valladolid in July 1217, in which she ceded her own rights to the throne in favor of her son. Fernando III (1217–1252) was accepted there as the new king of Castile and a tardy invasion by Alfonso IX was unable to overturn that settlement. Nevertheless, skirmishes and conspiracies continued until definitive peace was established in 1220 between the Leonese and the Castilians. A peace was also agreed during that same year between León and Portugal,

which had been struggling along the line of the Miño River.

Without threat or great prospects in the north, Alfonso IX was now to turn his attentions to the reconquest. There the Order of Alcántara took Valencia de Alcántara south of the Tajo in 1221, from which position in the northwest they could threaten the whole valley of the Middle Guadiana River from Mérida to Badajoz. Beginning in 1222 Alfonso IX began annual attacks on Cáceres, whose control led the approach from the northeast to those two cities. Each year he returned to the attack but failed to meet his objective. Then, in January 1224, the Muwāhhid caliph al-Mustanşir died and Muslim power in al-Andalus became increasingly fragmented as one contender after another sought control in Iberia or Morocco. Finally, in 1227, Cáceres fell to Alfonso IX. By 1230 that king was ready for a siege of Mérida. That undertaking called forth a relief army led by Ibn Hūd, former governor of Murcia and then the leader of the Muslim south, but it was defeated soundly at Alange, southeast of the city, and Mérida surrendered in March. The victorious army now moved downstream, where Badajoz promptly surrendered to it as well.

The whole of the upper and middle valleys of the Guadiana was now in Christian hands, but Alfonso IX died on 24 September 1230 while on his way to Santiago de Compostela to offer thanks for his late victories. He was interred in that cathedral. When Fernando III of Castile heard of his father's death he asserted his claim to the kingdom of León. His two half-sisters, born of Alfonso's first marriage to Teresa of Portugal, contested his claim but again his sister Berenguela arranged a settlement with Teresa at Benavente (on 11 December 1230), in which the infantas surrendered their claims in return for generous pensions. As a result, León and Castile were permanently reunited.

ALFONSO V, KING OF ARAGÓN, THE MAGNANIMOUS

Born 1396, the eldest son of Fernando of Antequera and Leonor de Alburquerque, Alfonso V passed much of his childhood in the court of his uncle, Enrique III of Castile. Fernando, Victor of Antequera (1410), core-

gent of Castile from 1406, and from 1412 (Compromise of Caspe) King of Aragón, became the boy's hero, a model of knightly prowess and kingly virtue. An abiding thirst for adventure, deep piety, and a passion for hunting all derived from that paternal source.

Fernando's brief reign in Aragón (1412–1416), besides grounding Alfonso in the arts of government, introduced him to the constitutional pretensions and Mediterranean concerns of his future subjects. Castile remained nonetheless a vital element in the family's dynastic and political calculations, as evidenced by his marriage to María of Castile (1415), a match that proved loveless and barren. Thrust by his father's fatal illness (1415–1416) into the center of affairs, Alfonso found himself confronting the antipope Benedict XIII and Sigismund, King of the Romans, in a meeting called at Perpignan to end the Schism. In this, his first great test of political judgment, he opted for the Council of Constance, yet took care to keep Benedict in reserve as a bargaining counter in dealings with the restored authority of Rome.

On 2 April 1416 Alfonso became King of Aragón. Looking around for warlike ventures that had hitherto eluded him, he saw Sicily and Sardinia restive under Aragonese domination, Genoa challenging Catalan aspirations in Corsica, and Castile chafing at the overweening Antequera presence. His subjects, however, especially the Catalans and Valencians, opposed all foreign projects for they mistrusted their new Castilian dynasty and were resolved to bind it in constitutional fetters. In the succeeding four-year contest of wills he won the upper hand thanks largely to clerical and Castilian subventions, then sailed in high spirits for Italian shores.

Touching first at Sardinia, he subdued that island without difficulty, but in his next objective—Corsica—encountered a desperate Genovese defense. Frustrated there, he moved on to Naples in the guise of champion and adopted heir of Giovanna II against Louis III of Anjou whom Pope Martin V, suzerain of the kingdom, planned to install as successor to the childless queen. Enthusiasm greeted his arrival (July 1421), but the war against Louis soon embroiled him in intrigues that within two years left him totally isolated. Rescued by a Catalan fleet, he embarked for Spain in October 1423, having first sacked Naples; on the homeward voyage he paused to burn Angevin Marseilles.

Spain presented its own problems: Catalan demands for curbs on royal authority, the consequences of a breach with Rome over the Neapolitan investiture, and turmoil in Castile provoked by blind rivalry between his brothers and Álvaro de Luna for control of that kingdom. Against his better judgment he allowed

Juan and a party of Castilian nobles to maneuver him into an intervention (1425) that freed another brother, Enrique, from captivity and briefly restored Antequera dominance. Within two years the brothers were again at odds, and Alfonso found himself once more driven to invade Castile. Álvaro Luna countered devastatingly by throwing the Antequera estates to his wavering adherents; a mere handful stirred to support Alfonso, Catalonia denounced the operation, and rebellion threatened in Aragón. His frontiers menaced by vastly superior Castilian forces, Alfonso was compelled to seek a truce that left the Antequera hold upon Castile broken and his own reputation battered. Small wonder that he developed an aversion to further involvement in Castile and seized upon an invitation from the anti-Angevin faction in Naples to prepare another Italian expedition. It cost many substantial concessions to the ruling classes of Catalonia before he could sail again in 1432, leaving his wife and Juan as regents in that province and Aragón, respectively.

Uncertain how matters stood in Naples, he alighted first in Sicily, then essayed a punitive raid against Tunisia that demonstrated his naval power and crusading credentials but deepened the hostility of that Muslim state. An attempt to force the issue in Naples by a show of strength at Ischia (1435) having come to nothing, he had to retire once again to Sicily and wait for the unfolding of events. At this juncture pressure from his brothers threatened to draw him back to Spa, where renewed war loomed with Castile. Orders for return had already been given when news that first Louis of Anjou, then Giovanna, had died transformed his prospects. Supported by all his brothers, he made for the mainland to claim his inheritance.

Yet again, Genoa's fear of a Catalan stranglehold on the western Mediterranean snatched away apparently certain victory. In a battle off Ponza (5 August 1435) its fleet not only destroyed an overconfident enemy but took Alfonso, two brothers, and a host of nobles as prisoners. Hauled, albeit courteously, to Milan—Genoa's overlord—Alfonso looked to all the world a beaten man. Yet by a veritable coup de theatre he transformed his captor, the volatile Visconti duke, into a devoted ally. Together they plotted a condominium over Italy, and early in 1436 Alfonso was once more pursuing his conquest of Naples. Dogged opposition from the papacy, Genoa, and René of Anjou delayed victory for another six years until with the fall of the capital on 2 June 1442 all resistance crumbled. A great triumph had crowned decades of unrelenting persistence.

Alfonso now faced a choice between exploiting his Italian victory and returning to Spain, where domestic problems and Castilian complications contin-

ued to fester. While always proclaiming his intention to return, he chose instead to spend the rest of his life in Italy, where he enjoyed more unfettered authority, alluring international opportunities, and a stimulating cultural environment. Already he had gathered there his three children—all illegitimate—and proclaimed his only son, Ferdinando, heir to Naples. Wholeheartedly he threw himself into the strife of Italy, seeking to establish a virtual protectorate over the papal states, reduce Genoa to subservience, make good his claim upon Corsica, and secure, despite Venice, a hold upon the eastern shores of the Adriatic. Failure to find a dependable ally frustrated all these ambitions in some measure. Most galling of all was the about-face of his former chancellor, Alfonso Borja, who, once planted on the papal throne as Calixtus III (1455), turned from servitor into implacable foe.

More successfully, Alfonso exploited the commercial potential of his conquest, encouraging Catalans and Valencians to follow royal example. From Flanders to Alexandria royal vessels plied their trade as he wove schemes to integrate his states into an economic community.

Art and learning also fascinated him. From early youth he developed a taste for music and books; later he cultivated interests in architecture, painting, and sculpture. In his maturity these resulted in a library, a musical establishment, and a royal palace (Castelnuovo, Naples) to rival any in Europe. Under his patronage Italian and Spanish men of arts and letters brought the Renaissance to life in southern Italy and sowed its seed in Spain.

Ambitious, inscrutable, politically shrewd, and an indefatigable administrator, Alfonso V devoted himself conscientiously to his duty in the conviction that royal authority divinely ordained better served the common good than did the play of private interest. In war he displayed tenacity, courage, and a sense of mission rather than brilliant generalship. Sobriety marked his behavior as man and king, save for the occasional display of magnificence, and his autumnal passion for Lucrezia d'Alagno, a young Neapolitan.

He died on 27 June 1458, leaving Naples to his son and his other dominions to his brother Juan.

ALFONSO V, KING OF LEÓN

When Vermudo II died in 999 he left his five-year-old son, Alfonso V (999–1028), in most difficult circumstances. The great vizier of the Córdoba caliphate, Al-Manṣūr, was at the height of his power. He had taken and sacked Barcelona in 987, León and Zamora in 988, and most recently Santiago de Compostela in 997, destroying there the church built by Alfonso III and carrying off its bells to decorate the mosque in Córdoba. Vermudo II sought a five-year truce before he died, and Al-Manṣūr himself died in 1002 but his son, 'Abd al-Malik (reigned 1002–1008) kept up the policy of raids against the north until his early death.

That latter event coincided with the beginning of the personal rule of Alfonso V in 1008. His mother, the queen mother Elvira, and the Galician count Menendo González had had to bear the brunt of the Muslim assault during his minority. The death of 'Abd al-Malik also precipitated the abrupt decline of the caliphate and Muslim Andalusia so that the threat from that quarter was effectively removed. What would concern Alfonso V most was the growing ascendancy of Sancho García el mayor of Navarre (1000–1035).

Alfonso managed to maintain his own independence of action during his lifetime but found it politic to marry Urraca, the sister of the Navarrese King Sancho. Still, he was unable to forestall the increasing influence of Sancho in Castile, traditionally a county of the Leonese kingdom. The Navarrese contrived his own marriage with the sister of its count, García Sánchez (1017–1029), and would claim the county for himself after the murder of the count in 1029.

The Leonese monarch would be chiefly remembered for the council of the realm held at León in 1017, which took measures to restore the regular government of the kingdom and of that rebuilt city. He did prove as well to be quite capable in taking advantage of the contemporary Muslim weakness to restore the fortunes of León. In 1028 he was conducting a siege of Muslim Viseu in the north of Portugal when he was killed by an arrow.

His early death left an eleven-year-old son, Vermudo III (reigned 1028–1037), to succeed him in a realm actually ruled by the queen mother Urraca, Sancho of Navarre's sister.

ALFONSO VI, KING OF LEÓN-CASTILE

The second son of Fernando I, King of León-Castile (1037–1065), he was born about 1037. On the death of Fernando I the kingdom was divided between Alfonso and his two brothers. Sancho, the eldest, received the kingdom of Castile and the overlordship of the tributary Christian kingdom of Navarre as well as that of the Muslim *tā'ifa* (party kingdom) of Zaragoza. García, the youngest, was awarded Galicia-Portugal and the tributary Muslim kingdom of Badajoz. To Alfonso went Asturias, León, parts of the Bierzo and the Sorian highlands, and the tributary *tā'ifa* of Toledo. The division did not last long. In 1071 Alfonso took control of the lands of García and in 1072 was himself defeated in battle and dispossessed briefly by his brother Sancho in 1072. After a short term of exile in Toledo, Alfonso returned after the assassination of Sancho, outside the walls of Zamora in September 1072, and now became the ruler of the reconstituted kingdom of his father. When García returned from exile in Badajoz in 1073, Alfonso had him imprisoned until the former's death in March 1090.

The kingdom of León-Castile grew under Alfonso VI to be the greatest realm of the peninsula, Christian or Muslim. The major step in this process was the conquest of the *tā'ifa* of Toledo, which formally surrendered on 25 May 1085. With that success, the southern boundary of the kingdom was carried from the north bank of the Duero River to the north bank of the Tajo River. It enabled Alfonso to carry out the repopulation of the northern *meseta* (plateau) between the Duero and the Guadarrama Mountains unhindered and to begin that of the southern *meseta* between the Guadarrama and the Tajo. For a brief time the kingdom even included the old Toledan lands south of the Tajo and north of the Sierra Morena. Moreover, on the assassination of the king of Navarre, his cousin Sancho García IV (1054–1076), Alfonso participated with the King of Aragón, his cousin Sancho Ramírez I (1063–1094), in the partition of Navarre. León-Castile's share was most of the upper Rioja along the Ebro River.

The surrender of Toledo to Alfonso VI in 1085 was followed by his installation of the former Muslim ruler there, Al-Qādir, in the *tā'ifa* of Valencia in the east as his tributary. Since the other Muslim kings in Iberia, from Zaragoza through Granada, Seville, and Badajoz, were also his tributaries, the Leonese was virtually master of the entire peninsula. Under the circumstances, the Muslim rulers of the south appealed to the Murābit emir, Yūsuf Ibn Tāshfīn of Morocco, for protection. The Murābit were a Berber fundamentalist sect who from midcentury had been gradually overrunning Morocco and by this date controlled an

empire stretching from the southern Sahara to the Mediterranean with its capital at the newly built Marrakesh.

In 1086 in response to the appeal of the Muslims of Andalusia, the Murābit crossed the Strait of Gibraltar. They advanced to the neighborhood of Badajoz where, with their Andalusian allies, they defeated the army of Alfonso VI at Zallāqah on 23 October 1086. Although Alfonso and much of his army escaped, he was to spend the remainder of his life battling to defend his realm against the Murābit.

In the aftermath of Zallāqah, the fundamentalist Murābit were to depose, one by one, the rulers of the Iberian *tā'ifas* whom they considered unfaithful to the Qur'ān because of their imposition of illegal taxes on the faithful; their use of alcohol, music, and poetry; and their payment of tribute to Alfonso VI, an infidel, above all. Gradually Muslim Iberia became the province of a North African empire. Yūsuf annexed Granada in 1090, Seville in 1091, and Badajoz in 1094. Valencia eluded him until 1102 when it was conquered by the Castilian adventurer Rodrigo Díaz de Vivar, usually called El Cid, who held it until his death in 1099. Zaragoza remained independent until 1110, by which time both Alfonso VI and Yūsuf Ibn Tāshfīn were dead. The Leonese monarch was the major Murābit opponent in all of this and defended the independence of the *tā'ifas* as best he could. Yet by his death in 1109, he had been forced back to the line of the Tajo and it was unclear if even the north bank of that river and the city of Toledo itself could be held.

At the same time, León-Castile was entering into a much closer relationship with Europe north of the Pyrenees. Fernando I had sealed a pact of friendship with the great Burgundian monastery of Cluny and agreed to subsidize that house in the amount of 1,000 gold *dinars* per annum. Alfonso VI would double that census and, in addition, begin the process of granting possession and authority over Leonese royal monasteries to the French house. By the end of his reign the Cluniac province in his kingdom counted better than a half-dozen houses. This cooperation with Cluny was joined to a similar policy of close ties with the Roman church. At the urging of Pope Gregory VII, Alfonso agreed to see that the Roman liturgical ritual replaced the Mozarabic one. In return he received the support of Rome for the restoration of the metropolitan sees of Braga and Toledo, the bishoprics of Salamanca, Segovia, Osma, Burgos, and Coimbra, and the recognition of the older royal creation at Oviedo. The former Cluniac monk Bernard was recognized by Pope Urban II as archbishop of Toledo in 1088, and that archbishop and his king and patron would fill up most of the new sees created with reforming French Cluniac monks.

These processes were accompanied by a rapid growth of the pilgrimage to the shrine of St. James at Santiago de Compostela by the peoples of western Europe. This also meant the infusion of the new Romanesque art, the Carolingian script, a more rigorous Latin, and a variety of other French manners into León-Castile. The great Romanesque cathedral at Santiago de Compostela, begun in 1076, is the most monumental example of this phenomenon. Most larger towns, even Toledo in the extreme south, would come to have their *barrio* (quarter) of French artisans and merchants as a side effect of the pilgrimage but there was no significant immigration of French nobles such as would shortly take place in Aragón.

In that respect, the most significant development was the marriage by Alfonso VI to a succession of foreign brides for his queens as he sought both a male heir and the prestige of an international match for its effect in the peninsula. Inés of Aquitaine (1074–1077), Constance of Burgundy (1078–1093), Berta of Lombardy (1095–1100), Elizabeth of France (1100–1106), and Béatrice of France (1108–1109) were such brides. On the other hand, Alfonso's only known son, Sancho Alfónsez (1094?–1108), was the son of the Muslim concubine Zaida, who became his wife in 1106 and died shortly thereafter.

The Burgundian alliance was also to be reflected in the marriage of Alfonso's daughter by Constance, Urraca, to Count Raymond of Burgundy who became Count of Galicia-Portugal and probably heir apparent in 1088. That match was followed by a similar marriage of a daughter by the Asturian noblewoman Jimena Muñoz, Teresa, to Raymond's cousin, Count Henri of Burgundy in 1096. Henri thus became Count of Portugal. The son of Raymond and Urraca was to become Alfonso VII of León-Castile (1126–1157). The son of Henri and Teresa was to become Afonso I of Portugal (1128–1185). In the lifetime of Alfonso VI the two counts were to become chief figures at his court and administrators and defenders of the west during the campaigning season. Another daughter, Elvira, born of Jimena Muñoz, was married to Count Raymond of Toulouse by 1094 and subsequently bore him a son in the Holy Land, Alfonso Jordán, who himself later became count of Toulouse.

In the spring of 1108 Alfonso VI was still engrossed in defending his realm from the attacks of the Murābit emirs of Morocco. On 29 May 1108 at the fortress of Uclés, about thirty kilometers south of the Tajo, one of his armies was routed by the enemy and his only son, Sancho Alfónsez, was killed. To solve the succession crisis the king turned to his daughter, Urraca (1109–1126), whose husband Raymond of Burgundy had died in November 1107. But he also

provided for her future marriage to her cousin, Alfonso I, el Batallador, of Aragón (1104–1134), so as to provide for the military safety of the kingdom. Alfonso VI himself was seeing to those defenses at Toledo when he died on 1 July 1109, at the age of seventy-two. He was buried at the royal monastery of Sahagún on 21 July 1109.

ALFONSO VII, KING OF LEÓN-CASTILE

Born on 1 March 1105 to the Infanta Urraca and Count Henri of Burgundy, the child was early to have a political influence. After his mother's accession to the crown of León-Castile the boy became a pawn in the hands of his powerful guardians, Bishop Diego Gelmírez of Santiago de Compostela and Count Pedro Froílaz of Galicia, in their opposition to the queen's policies. That game was not ended until Urraca associated her young son with herself in 1116, made him the titular ruler of Toledo and the lands south of the Duero River, and largely separated him from his prior mentors.

Upon his mother's death on 8 March 1126, he became Alfonso VII but had to face a wide variety of problems in the early years of his reign. One of these was the emerging kingdom of Portugal. Once a frontier county of León-Castile, the territory had enjoyed practical independence since the death of his grandfather, Alfonso VI (1065–1109). By 1126 his aunt, Teresa, who ruled there had adopted the title "queen" from 1117. When Teresa's own son, Afonso Henriques, forced her into exile in 1128, he affected the title "Infans" initially but by 1140 had come to call himself "Rex Portugalensis." His Leonese cousin fought two border wars with him in 1137 and 1140–1141 to forestall what was happening, but after the second of them the latter had to recognize Afonso I of Portugal (1128–1185) as king, if a vassal of León-Castile.

A second problem was to establish himself at home against the nobility of the realm. The chief threat was furnished by the house of the Lara counts of Castile and Asturias de Santillana, under Pedro and Rodrigo González, respectively. Count Pedro had been the third husband of Queen Urraca and the father of at least two children by her. The Lara thus represented

a real threat and the Lara counts fomented a series of conspiracies and finally a rebellion in 1130 before their power was broken in that year. The same year had also seen an independent revolt by the magnate Diego Peláez in Asturias de Oviedo that recurred intermittently until 1134, by which time all internal resistance was at an end.

While coping with these two as best he could, Alfonso VII also had to deal with the problem of another stepfather, Alfonso I of Aragón (1104–1134). The Aragonese monarch had been married to Queen Urraca between 1109 and 1112. The marriage was consanguinous, foundered on the opposition of the papacy, the nobility of the realm, and its inability to produce a child. But Alfonso I had fought a war with Urraca between 1113 and 1116 to retain his title to León-Castile and still in 1126 held the Rioja, the Sorian highlands, eastern Castile, and a salient reaching west into León as far as Carrión de los Condes. Between 1127 and 1131, Alfonso VII waged a series of campaigns against his stepfather that resulted in the liberation of all of this territory up to the borders of the Rioja.

Alfonso I of Aragón had largely been preoccupied by the consolidation of his hold on the lands of the *tā'ifa* (party) kingdom of Zaragoza, which had fallen to him in December 1118 and had roughly quadrupled his prior realm in size and population. Now a Murābit counterattack inflicted a crushing defeat on him at Fraga on 17 July 1134, and Alfonso died on 7 September 1134, probably of wounds suffered there. The makeshift kingdom of Aragón now began to disintegrate. Ramiro II of Aragón (1134–1137) never was able to make his authority felt everywhere. To the northeast, García Ramírez IV (1134–1150) resurrected the former kingdom of Navarre out of its ruins. Alfonso VII seized the opportunity to reclaim the Rioja and the Sorian highlands, and attempted to annex the district around Zaragoza and Tarazona on the Middle Ebro. A three-cornered war erupted that lasted until 1142.

By 1137 Alfonso VII was forced to allow Count Ramón Berenguer of Barcelona (1131–1162) to rule in Aragón and the territories of Zaragoza. The count had been his brother-in-law since 1127, and had become the son-in-law of Ramiro II of Aragón in 1137 by marriage to the latter's daughter, Petronilla. Now Ramón Berenguer became the ruler of the kingdom of Aragón-Catalonia, although he did homage to Alfonso VII for Zaragoza. The Leonese king had also made peace with García Ramírez of Navarre in 1140, and that king did homage as well. With these rulers as his vassals, Alfonso now arranged his own coronation as "emperor" in the city of León on Pentecost, 26 May 1135.

Although the details of his domestic policy are not well understood, he kept a firm hand on the church of the realm. In the Council of Carrión in February 1130, for instance, he had the bishops of León, Oviedo, and Salamanca deposed and replaced by his own candidates. Alfonso also actively pursued the repopulation of the valley of the Tajo River at the same time as he pushed its frontiers south against the weakening Muslim foe. From the time when peace had been achieved with Navarre and Portugal by 1142, Alfonso VII's policy was bent on securing a coalition of the Christian powers against the Murābit Empire in the Iberian Peninsula. That Muslim empire was already being cannibalized in North Africa by the growing successes of the new, fundamentalist Muwāhhid movement and was rife with revolt in Andalusia. In 1146, Alfonso laid siege to Córdoba itself and forced its ruler to become his vassal. The following year, at the head of a force that included a fleet from Genoa, the Aragonese under Ramón Berenguer, and the the Navarrese under García Ramírez, Alfonso captured the Mediterranean port of Almería in the southeast after overrunning most of Upper Andalusia.

Meanwhile, Afonso I of Portugal had taken Santarém in a surprise attack that March and, joined by a Flemish and English fleet bound for Palestine and the Second Crusade there, that monarch captured Lisbon in October 1147. Portions of that crusading army joined Ramón Berenguer and the Genoese fleet in 1148 to take Tortosa. In 1149, the Aragonese king took Lérida. In short, the northern coalition had permanently freed the basin of the Tajo in Portugal, and that of the Ebro in Aragón-Catalonia from the grip of Islam.

In subsequent years, Alfonso VII was unable to keep his allies in the field against the growing power of the Muwāhhid Empire, which had now mastered all of Morocco and Algeria in North Africa and was increasingly active in Andalusia. While the Portuguese and the Aragonese-Catalonian kingdoms would retain their gains of the period, Alfonso VII himself would meet his death from exhaustion at Las Fresnedas just north of the Sierra Morena on 21 August 1157. He was returning from an unsuccessful attempt to force the lifting of a Muwāhhid siege of Almería. That town fell again into Muslim hands, as would all of Upper Andalusia eventually.

After his death, Alfonso's León-Castile was divided into two kingdoms. His oldest son, Sancho III (1157–1158), would rule Old and New Castile, the Rioja, and the Basque country. His younger son, Fernando II (1157–1188), obtained León, Galicia, and Estremadura.

ALFONSO VIII, KING OF CASTILE

Alfonso VIII (1155–1214; king of Castile, 1158–1214) was the son of Sancho III of Castile and Blanche of Navarre, grandson of Alfonso VII of León-Castile. Among the main points of Alfonso's long reign are the battles of Alarcos (1195) and Las Navas de Tolosa (1212); the siege of Cuenca (1177) and the granting of its *fuero* (privileges); and, together with his consort, Eleanor, the foundation of the monastery of Las Huelgas.

Alfonso's Minority

Alfonso's reign began inauspiciously. Orphaned by the death of his father, Alfonso's minority was marked by unrest and civil war. In his will Sancho III had divided the regency and the tutelage of the king between the noble families of Lara and Castro. The Laras forced the Castros to surrender Alfonso to them, and a civil war broke out between the two families. The Castros invited Alfonso's uncle, Fernando II of León, to intervene in the matter. Fernando II garrisoned his troops in Toledo and collected its revenues until 1166. He acted as Alfonso's tutor, although he never gained custody of Alfonso himself. In 1166 the Castilian bishops intervened and threw their support behind Alfonso VIII and the Laras. Alfonso and his regent regained Toledo and defeated the Castros in a series of campaigns that lasted from 1166 until 1168.

Alfonso's Reign

The end of Alfonso's minority in 1169 was marked by a curia in Burgos, which reviewed Castile's alliances with the other peninsular kingdoms. Alfonso's relations with other kings in the Iberian Peninsula varied, depending upon the relative strengths and weaknesses of the peninsular kingdoms. He maintained peaceful relations with his uncle, Fernando II, and he established friendly relations with Alfonso II of Aragón, making a pact with him in Sahagún in 1168. Sancho VI of Navarre, however, had invaded the Rioja and issued *fueros* there in 1164. Seeking an alliance outside the peninsula in order to regain these territories,

the young king held a curia in Burgos in 1169–1170 that selected Eleanor, daughter of Henry II and Eleanor of Aquitaine, as a prospective consort for the king. The marriage took place in 1170. Eleanor had been chosen as a prospective spouse in order to gain Henry II's support for the recovery of Castilian lands from Navarre; portions of Eleanor's dower consisted of the parts of Castile occupied by Sancho VI. Castile began to recover its lands in the Rioja in 1170–1179, and went to war with Navarre in 1173. Alfonso VIII and Sancho IV agreed to arbitration before Henry II in 1176–1179, who found in favor of Alfonso VIII.

Relations with the Almohads

The Almohads had occupied most of the towns of al-Andalus in the 1160s, and by 1172 they were campaigning in the vicinity of Toledo, harassing Huete and Talavera. During this period Alfonso VIII entrusted most of the defense and resettlement of the Toledo frontier to the military religious orders of Santiago and Calatrava. In 1177 Castile, León, and Aragón agreed to the Treaty of Tarazona, in which they planned their campaigns against the Muslims. As a consequence of this treaty, Alfonso undertook the siege of Cuenca, a naturally fortified city east of Toledo located on Castile's border with Valencia. Although no contemporary narrative account of the siege survives, other evidence suggests that the siege sapped the resources of both Alfonso and the Castilian nobility. Alfonso captured the city of Cuenca, marking his first major military victory. He established a bishopric there, and Cuenca formed Castile's nucleus of repopulation for the La Mancha area. The major legal development of Alfonso VIII's reign was the implementation and granting of the *Fuero* of Cuenca, a systematic municipal law that became a model for later *fueros*.

Prelude to Alarcos

With the Treaty of Cazorla (1179), Alfonso VIII and Alfonso II agreed upon a division of the Muslim territories in the peninsula between Castile and Aragón. Aragón would expand in the territories to its south: Valencia, Játiva, Biar, Denia, and Calpe; Castile had free play in all the lands beyond. But after Cazorla, relations cooled between Castile and Aragón, and in 1190 Alfonso II joined forces with Sancho VI of Navarre against Castile. Meanwhile, Fernando II of León died in 1188, and Alfonso VIII tried to gain ascendancy over the new king, his cousin Alfonso IX. At the Curia of Carrión (1188), Alfonso VIII knighted Alfonso IX, who in return paid him homage and fealty. This act

ultimately caused Alfonso IX to resent Alfonso VIII. León joined with Aragón and Portugal in a pact against Alfonso VIII, although the Treaty of Tordehumos (1194) patched up a temporary peace between León and Castile.

Alarcos

Al-Manṣūr, the Almohad caliph, proclaimed a holy war in retaliation against the Christians in June 1195. That summer he arrived in the vicinity of Alarcos, where Alfonso VIII rushed to meet him. The fortress of Alarcos was still uncompleted, and Alfonso initiated the engagement before expected Leonese reinforcements arrived. His impetuosity lost the battle; Alarcos was a major victory for the Almohads. Alfonso VIII fled with the remnants of his army to Toledo, while Al-Manṣūr captured the fortresses on the road to Toledo, including Calatrava, and ravaged Toledo's hinterlands. He did not, however, pursue his victory, and returned to Seville. Alfonso VIII obtained a treaty from the Almohads in 1197.

Aftermath of Alarcos

The defeat at Alarcos caused a crisis in Christian Spain. Alfonso II of Aragón attempted to promote peace among the Christian kings against the Almohads, but he died in 1196. Sancho VII of Navarre resumed attacks upon the Rioja, and Alfonso IX continued to attack Castile, claiming certain castles on the Castilian-Leonese border. Alfonso VIII's wife, Eleanor, proposed a marriage alliance between Alfonso IX and her daughter, Berenguela. The marriage took place in 1197, and the disputed castles were settled on Berenguela. But since the couple were cousins the pope forced them to separate, and they did so in 1204. The Treaty of Cabreros (1206) ended the marriage between Alfonso IX and Berenguela but recognized their son, Fernando, as Alfonso IX's heir. Berenguela and her two sons returned to Alfonso VIII's court. The Treaty of Valladolid (1209) settled the property issues raised by the annulment of the marriage.

Northern Campaigns

The treaty with the Almohads and the alliance with León enabled Alfonso to concentrate on the Navarrese incursions and to campaign in the Basque provinces of Guipúzcoa and Álava. He sought assistance from his brother-in-law, John of England, in 1199, and in 1200 he and Eleanor agreed to the marriage of their second daughter, Blanche, to Philip Augustus's heir, the future Louis VIII, as part of the treaty between England and France. But John and Philip Augustus

resumed their fight, and John made a treaty with Sancho VII of Navarre. In turn, Alfonso VIII and Philip Augustus entered into alliance. Eventually, the kings of Castile, Navarre, and Aragón entered into a concord in 1204, and Alfonso VIII obtained the lands disputed with Navarre by treaty in 1207.

Gascony

Though Part of Eleanor's dowry, John refused to surrender Gascony after the death of Eleanor of Aquitaine in 1204. At the risk of war with Navarre and England, Alfonso campaigned in Gascony, but despite some initial success he was unable to secure Bayonne. Castile did not drop its claims to Gascony until the marriage of Eleanor of Castile to Edward I in 1254.

Prelude to Las Navas

Meanwhile, Pope Innocent III urged the bishops of the Iberian Peninsula to encourage the monarchs there to patch up their quarrels and resume the Reconquest. Rodrigo Jiménez de Rada, archbishop of Toledo, took a leading role in urging Alfonso to wage a crusade against the Almohads. The treaty with the Almohads was running out, and Alfonso's settlement of Moya in 1209 helped precipitate matters. Pedro II of Aragón began capturing cities in Valencia, and Alfonso VIII's heir, Fernando, dedicated himself to crusade.

Las Navas

In response to Christian raids and incursions, the Almohad caliph, Al-Nāṣir (called Miramamolín by the Christians), entered the peninsula and took the road to Toledo in 1211. He besieged the castle of Salvatierra, the home of the Order of Calatrava after Alarcos. The castle did not surrender until the end of the summer, and Al-Nāṣir returned to Córdoba to resume his campaigns the following year. This gave the Christians time to assemble an army in Toledo, consisting of Castilians, Leonese, Navarrese, Aragonese, and French troops, who left after the recapture of Calatrava. When the army set out it was led by three kings, Alfonso VIII, Pedro II, and Sancho VII. The battle took place on 16 July 1212, and it marked a major victory for the Christian forces. Alfonso VIII and his daughter, Berenguela, sent reports of the battle to Innocent III and Blanche of Castile, and the trophies from the battle were distributed over Christian Spain. The victory of Las Navas destroyed Almohad power in Spain and enabled the advance of the Christians in the thirteenth century.

Succession

Alfonso and Eleanor had ten children: Berenguela (1180–1246), who was proclaimed Alfonso's heir at the curia of Carrión in 1188 and who was first betrothed to Conrad of Germany, but married her cousin, Alfonso IX of León; Sancho (1181); Sancha (1182–1184); Urraca (1186–1220), who married Alfonso II of Portugal in 1208; Blanche (1188–1252), who married Louis VIII of France in 1199; Fernando (1189–1211); Mafalda (?–1204); Leonor (?–?), who was briefly married to Jaime the Conqueror; Constanza (?–1243); and Enrique (1204–1215), later Enrique II. Despite his numerous progeny, Alfonso's succession was clouded by the death of his oldest surviving son, Fernando, during the campaigns prior to Las Navas. Fernando had been unmarried, and Alfonso's other surviving son, Enrique, was ten years old when Alfonso died. Queen Eleanor, who had been named in Alfonso's will as Enrique's regent, only survived her spouse by one month. Enrique II's minority, like his father's, was marred by civil war. But Enrique died in 1215, and the throne devolved to his sister, Alfonso's oldest daughter, Berenguela. Berenguela stood aside in favor of her son, Fernando III.

Burial

Alfonso VIII and Eleanor had jointly founded the Cistercian monastery of Las Huelgas in Burgos and endowed it with numerous privileges and properties. The complex included a hospital and convent. It also served as a royal necropolis, and the pair were buried there in a joint tomb.

ALFONSO X, EL SABIO, KING OF CASTILE AND LEÓN, ARTISTIC PATRONAGE, ART, MINIATURES, AND PORTRAITS

Alfonso X's artistic patronage, well documented in the realm of the illuminated manuscript book, is more uncertain in other areas. The research of Rafael Cómez Ramos is the necessary starting point of departure for the study of Alfonso's patronage of architecture, sculpture, and metalwork.

In the field of architecture, Alfonso's patronage appears to have been extended to two great thirteenth-century cathedrals, at Burgos and León, but not to a well-documented degree. The king seems also to have played a decisive role in the construction of the more modest cathedral of Badajoz. His intervention in these

projects cannot, however, be compared to that of the French monarchs who collaborated through their patronage in the construction of the great cathedrals in and around Paris. The kings of France were both anointed and buried in their immense cathedrals, such as Saint-Denis, the first Gothic building in history, and Reims, where they received the crown of the realm from princes of the Church. Alfonso, however, according to his two surviving wills and testaments, vacillated between being interred in the Capilla Real of the Cathedral of Córdoba (which he had constructed ca. 1263) and two other former mosques that had been converted into churches: Santa María la Real of Murcia, and the Cathedral of Seville, where his parents, Fernando II and Beatriz of Swabia, had been buried. This indecision proved disagreeable to the bishops of each locale, who later allied themselves with the cities and the aristocracy and threw their support to the Infante don Sancho when he rebelled against his father.

Sancho IV, in his eponymous *Privilegio rodado e historiado*, referred to himself as the vicar of Christ in his kingdoms and forged an agreement with the bishops who aided him in the usurpation of the throne to be buried in the Cathedral at Toledo, where he had been crowned. At the same time, Alfonso X's tendency toward autocracy and absolutism, which, according to Peter Linehan, compelled the Vatican to investigate, also does not sit well with the notion of a patron who looked kindly on the construction of great cathedrals, even though he may have made some tentative gestures in this direction at the beginning of his reign. This notwithstanding, a case may be made for an Alfonsine ecclesiastical architecture in Andalusia, in the parishes of Córdoba, Jerez, and Seville, as well as for evidence of patronage in civil works (palaces, some strongholds, and the Ataranzas of Seville).

The sculpture and images of the cathedrals of Burgos and León have been the subject of recent careful scrutiny. The putative likenesses of Alfonso X and Doña Violante at Burgos have been shown to be problematic: they have been identified by Yarza as portraits of Solomon and Queen Sab, in an iconographical scheme much more attune to French traditions. They are additionally complicated by the fact that in all extant Alfonsine miniatures the king never appears with his consort. Alfonso's supposed representation in a stained glass window at León has been identified by Domínguez Rodríguez as that of Sancho IV, who bears an orb and scepter in his hands, symbols that closely identify Sancho with his ecclesiastical consecration, evidence of which cannot be found for Alfonso from among all his known manuscript portraits.

It is in the field of manuscript portraiture and illumination that Alfonso X's artistic patronage excelled

and cannot be doubted. Alfonso's greatest labor in this area are the *Cantigas de Santa María*, of which there are two manuscripts that contain miniatures. The first is the so-called *Códice rico* (Escorial T.I.1 and Biblioteca Nazionale, Firenze Ms. B.R.20) and the *Códice princeps*, also referred to as *de los músicos* (Escorial B.I.2). The latter embraces forty-one miniatures, and although it is a work of secondary artistic merit has great historical, archeological, and musicological value. The miniatures in it show musical instruments in great detail while the text offers musical annotations that have permitted the reconstruction of the instruments and the reproduction of the music in modern times.

In contrast to his contemporary French and English monarchs, Alfonso did not occupy himself with the decoration of religious and liturgical books and psalters with miniatures, although some attempts have been made to tie his work to the Parisian tradition. While St. Louis was entirely compatible with the Church, which heaped its blessings upon him, Alfonso was much less so. The iconography of the *Códice rico* of the *Cantigas* portrays the Spanish king in diverse guises and poses: as a troubadour, with Christ and the Virgin occupying in a manner unprecedented anywhere a space normally reserved for saints or members of the clergy, lecturing to followers, or reciting poetry in public. His scientific works (*Lapidario*, *Libros del saber de astronomía*, *Manuscrito astrológico vaticano*) all have ties to pagan astrology, under interdiction by both the Church and the papacy, while his *Libro de ajedrez* (Escorial T.I.6), which the king recommends in the prologue for both leisure and the sharpening of wits, was proscribed by St. Louis in France. When compared to St. Louis, who publicly praised the Bible *Moralisé*, or the Bolognese Bibles based on the Vulgate, all with moralized commentaries and interpretations, Alfonso sought a direct translation of the Bible even from Hebrew sources. He sought to carry out more literal interpretations of it, too, when he incorporated parts of it, along with classical and Arabic sources, into his *General estoria*.

The miniatures in Alfonso's works have been compared by Domínguez Rodríguez with *De arte venandi cum avibus* and *De balneis puteolanis* from the south of Italy by King Manfred, the successor of Frederick II of Sicily. Both Manfred and Alfonso most likely found common ground in Byzantine and Islamic sources and antecedents. Gonzalo Menéndez Pidal has also pointed out the similarity of many Alfonsine miniatures to those from the Latin kingdom of Jerusalem, an observation that surely deserves further investigation.

Alfonso's second greatest illuminated work after the *Cantigas* is his *Lapidario*. Each of these books was designed to be exhibited on a book stand and they are the only extant works comparable to the Bibles *Moralisés* and the Bolognese Bibles, the greatest works of miniatures of the thirteenth century in Europe. The miniatures in the remaining Alfonsine books are of lesser quality and are not independent of the text, having been placed at the end of chapters as illustrations of content. However, the *Estoria de España* (Escorial Y.I.2) is of note for its portrayal of the heroes and monuments of antiquity, done with a distinct sensibility that eschews the traditional Gothic way of representing them. The manuscripts of Alfonso's *Primera partida* (British Library Ms. Add. 20,787) and the *Libro de los juegos de ajedrez, dados y tablas* (Escorial T.I.6) are also of note for the number of miniatures they contain. In contrast, the Vatican manuscript of the *General estoria* (Ms. Urb. Lat. 539), the fourth and only original Alfonsine part of this work to be preserved, contains only one miniature.

The sole surviving contemporary portraits of Alfonso are the ones that appear in his illuminated manuscripts, identified by their placement as frontispieces or in the narrative prologues of the works. At the same time, there are several portrayals of the king as a troubadour or as the recipient of a miracle in the *Cantigas*. He is recognizable in the latter by means of his clothing and the heraldic images on it. Later images contained in works such as the later fourteenth-century *Cartulario de Tojo Outos* (Arch. Hist. Nacional, Ms. 1.302), where he appears with Doña Violante, cannot be considered faithful images of the king. In the frontispieces of his works, Alfonso is generally portrayed as an author, sitting on his throne, right hand and index finger extended upright, dictating to his scribes who are sitting on the floor around him as courtiers listen and observe. These images imply the king's active participation in the creation of these works or their prologues. He is depicted in this way in the *Cantigas*, the *General estoria*, the *Estoria de España*, and the *Libro de los juegos*. Aristotle, who appears as a bearded sage in oriental garb surrounded by his disciples, is portrayed as the author of the *Lapidario*. In the latter, an image of Alfonso may be found in the first chapter receiving the book from its kneeling translator. Finally, the manuscript of the *Primera partida* offers three successive portraits of the king: one as the legislating sovereign with closed book in one hand and drawn sword in the other; another as a scholar dictating to his scribes; and a final one kneeling, looking up toward God in an act of reverence, with the book in his hands, an image that sustains Alfonso's absolutism and the notion that the king's legislative power comes from on high.

ALFONSO X, EL SABIO, KING OF CASTILE AND LEÓN, HISTORICAL WORKS

In 1274 the Alfonsine scriptorium abandoned work on the *Estoria de España*, a project that had occupied it for some years. By 1280 the same group had resumed work on its other great historical project, the *General estoria*, and managed to carry the text to where it ends in the modern edition. Neither composition was ever completed. The narrative of the *General estoria* runs up through the life of the Virgin Mary, while that of the *Estoria de España*, in its definitive form, goes only to about the year 800, although certain drafts and fragments do cover more recent periods. The unfinished state of the Spanish history may have something to do with the fact that the royal patron, Alfonso, was obliged to abandon his claim to the imperial throne: there is evidence that as the work was originally planned, he was to appear as the heir to both the Gothic

royal line and the imperial, and that when the claim failed, the king had little desire to see the project through. Both works are compilations, vast mosaics of texts from older authors. In this sense the *General estoria* and the *Estoria de España* are not greatly different from dozens of other historical productions of the Middle Ages, both in Latin and in vernaculars. What sets the Alfonsine histories apart from their fellows, however, is the fact that the compilers modified and manipulated their sources so as to give the definitive text a distinctive shape, and to make it yield themes and emphases that were alien to this older material. To all appearances, the compilers' work was done in three stages. First, the source texts were translated entirely, Orosius's *Histories*, Josephus's *Antiquities*. One such version has actually survived, a Castilian prose translation of Lucan's *Pharsalia*. Second came the cutting and pasting: long stretches of text were planned, and it was determined that one bit of Eutropius was to be placed here, and another of Orosius there. Finally, there was the polishing process. The prose style of the separate bits was made uniform, the pieces themselves were linked together logically, and incompatibilities between the source texts were in some cases resolved, but in others explained or simply pointed out. The translations themselves often wound up amplifying their originals heavily: this is a feature the two histories have in common with other vernacular compilations, like the French *Fet des romains* or the *Orose en français*.

The organizing principle of the *General estoria* is, of course, chronology; this ground plan comes to it from the *Chronici canones* of Eusebius and Jerome, a virtual calendar of past events that coordinates biblical history with the nonbiblical. *Chronici canones* constitutes the backbone of the *General estoria*, and the narratives from other sources make up its other members. The work's biblical history depends heavily on Flavius Josephus's *Antiquities of the Jews* and Comestor's *Historia scholastica* as well as the Bible itself, although certain Qu'ranic elements are not absent. Nonbiblical material comes from an astonishing variety of sources, ancient and medieval texts as unlike as Lucan's *Pharsalia*, covering the civil war, and a version of the *Historia de preliis* for the story of Alexander the Great. A curiously demythologized and Euhemerized version of Ovid's *Metamorphoses* gives us much of the early history of the race. One should emphasize that the compilers make little distinction between biblical history and nonbiblical: both seem to have the same status, and the pair join to form a master narrative that is uniformly authoritative.

The *General estoria* is a spectacular achievement, in many ways unique in the Middle Ages. Its scope is

broad. Its early portions present a highly original account of the progress of the human species from barbarism to civilization, in civil life, in material culture, in learning, and even in religion. Many of its conceptions are built around two large themes that are by no means uniquely Alfonsine: the *translatio studii* and the *translatio imperii*. The first as presented by the *General estoria* tells of the patriarch Abraham, liberal artist, natural philosopher, and monotheist, who passes on his lore to the Egyptians, whence it in turn goes on to the Greeks, Romans, and Franks. The second theme involves a purely human Jupiter, first universal emperor. Once again, Greeks, Romans, and Franks are seen as his successors; Frederick II, Alfonso's immediate predecessor on the imperial throne, is mentioned explicitly in this connection. One should make it clear that in forming all of these large conceptions the compilers are not wholly disrespectful of their sources. Hints, so to speak, in Josephus and others flower into these astonishing patterns of thought in the new text.

The *Estoria de España* has its own characteristic layout, quite different from that of the *General estoria*. We are given in succession an account of each of the dynasties and nations that ruled the Iberian Peninsula: Hercules and his successors, the "Almujuces," barely identifiable; Carthaginians; Romans; various lesser Germanic tribes; and finally, the Goths. The Arab domination, curiously, is seen as simply an episode in the Gothic period. In this sense, the Alfonsines follow a long line of earlier historians who present the kings of the Reconquest as Goths, in the full and literal meaning of the word successors of Tulga and Reccesvinth. The sections of the *Estoria de España* that are most fully developed are the Roman, and as we have seen, the Gothic. The former is divided into two parts, before and after Julius Caesar's assumption of the office of emperor (medievals generally regarded him as the first in the line). The account of the Republican period consists largely of episodes in Roman history that bear directly on Spain and its fortunes. The Second Punic War, for example, is treated extensively. The climax of the whole section is the long sequence on the rivalry and bloody war between Pompey and Julius Caesar. This text, heavily dependent on Lucan, figures largely in the *Estoria de España* not only because of the large role played by Spain in the history of the time, but because in the mind of the compilers it offers a lesson in statecraft: the community will not survive for if there are two powerful leaders on the scene. One would add that moral and political lessons are an important feature of both Alfonsine histories. The second part of the Roman section is simply an imperial history, with little focus on Spain or Spanish things.

In 1906, Ramón Menéndez Pidal published a long text he called *Primera crónica general*. Something more than half of the work consists of the incomplete *Estoria de España* as I have described it. The rest is a narrative of Spanish history into the reign of Fernando III of Castile. This curious production contains the provisional material mentioned above, the drafts and fragments that in one way or another are related to the original project of a general history of Spain. One feature of this text is that it includes prosified versions of Castilian *cantares de gesta*. Some of these are important for the whole narrative in that they recount episodes in the early history of Castile that do not appear in the Latin chronicles the compilers otherwise depend on. The story of the formation of this large unit is too complicated to set forth in any detail. The oldest portions consist of two long sections that date from 1289, that is to say, in the reign of Sancho IV. This is the closest in time of composition to that of the *Estoria de España*, but even in this material there are strains that are patently un-Alfonsine. But as it happens, there does exist an independent chronicle that is nowadays believed to be very early and to fairly well reflect the plans and intentions of the compilers of the *Estoria de España*—the *Crónica de veinte reyes*, a work that covers the long period from Fruela II to Fernando III. Different as it is (in varying degrees) from the *Primera crónica*, the general likeness of the two texts over long stretches assures us that the latter preserves no small amount of Alfonsine substance. *Primera crónica* does not do badly. Certain of its episodes are fashioned with an art and wit that can properly be called Alfonsine. One is the narrative of the division of the kingdom by Fernando I and the generation of warfare that follows. Another is the narrative of El Cid, down to the victory over the Count of Barcelona.

Long stretches of the *Estoria de España*, in both the completed part and the provisional, become traditional from its own time down to the sixteenth century. It survives in dozens of differing recensions, further *crónicas generales*, histories of the kings of Castile, and in particular chronicles of El Cid, Fernán González, and others.

ALFONSO X, EL SABIO, KING OF CASTILE AND LEÓN, LAW

A major contribution to Hispanic civilization is the body of law given form and organization during the early years of Alfonso X's reign (1252–1284). The need for new codification became apparent following extensive territorial conquests under Alfonso VIII and Fernando III and attendant political, demographic, and economic dislocations. Finding inspirational models in the unitary character perceived in the kingdom of Toledo and in Visigothic law, in the increasing contact with new legal ideas from Italy (notably Bologna), in familiarity with Justinian's legislation, and in recent examples (Valencia and Aragón) of a European trend toward new codification, Fernando III and his son, Alfonso X, conceived of a legislative plan that the father's death left the son to complete and execute.

Royal legislation during Alfonso's reign consists of three codes of general legislation and categories of special legislation. Of the codes, the *Espéculo* (in five, possibly seven, books redacted 1252–1255) was addressed to royal judges throughout Castile and contains the first systematic, detailed Hispanic treatment of the royal administration of justice. The *Fuero Real* (in four books, 1252–1255) contained more simply stated dispositions and was granted to specific municipalities (*concejos*) to whose needs it was directed. The *Siete Partidas* (in seven books, 1256–1265) made up a comprehensive code and veritable juridical encyclopedia. (The *Setenario*, self-described as an ethical guide prepared for educating heirs to the throne, at times has been included, erroneously, among the codes.) No manuscript from the Alfonsine chancery containing the text of these codes is known to exist, and the present titles are post-Alfonsine. These facts have led commentators to raise questions about textual accuracy, dating, completion, promulgation, and juridical relationships. The *Espéculo* probably was operative from 1255 to 1272 (although some say it was never promulgated); as did the *Setenario*, it served in the preparation of the *Siete Partidas*. The *Fuero Real* was operative in those municipalities from the date in the period 1255–1272, when it was granted (in some cases petition produced its abrogation by the king before the last

named date) and continued to be observed by some towns after 1272; in 1348 it became a part of general Castilian law. The *Siete Partidas* were first declared operative in 1348 as suppletory law, but the code's influence grew rapidly, given impetus by the appearance (1555) of the printed Gregorio López edition.

ALFONSO X, EL SABIO, KING OF CASTILE AND LEÓN, MUSICAL INSTRUMENTS OF CANTIGAS

The Escorial Codex B.I.2 (or E¹), also referred to as *Códice de los músicos*, contains the famous forty-one miniatures preceding the musical notations of each of alfonso's *cantigas de loor*. They depict a total of seventy-eight instrumentalists (*juglares*, shown mainly in pairs, six of whom perform alone [nos. 100, 180, 200, 290, 350, and 400]). Discounting duplications, the varied instruments they hold comprise thirty-five in number and represent but a sampling of the wind, stringed, and percussion instruments that were in use at the time. It is reasonable to assume that they were among the more popular instruments known to the court artists. About half are of Arabic origin (see below, preceded by an asterisk).

The largest group is the stringed instruments (chordophones), comprising fifteen distinct types from among the forty shown, drawn from (a) the lute family: *baldosa* (similar to the *vihuela de mano*; a seven-stringed long-necked lute)(120), *cítola* (two-stringed long-necked lute)(130), *guitarra latina* (four-stringed plucked) (1/r, 10/r, 150), **guitarra morisca* (20/r, 150), **laúd* (in Arabic, *al ud*)(30, 170/r), **rabé* or rebec (three-stringed *mandura* or plucked rebec) (90), **rabé morisco* or *rebab* (bowed two-stringed, Arabic *rabab*)(110, 170/l), *vihuela de arco* (*fidula*; bowed fiddle)(1/l, 10/l, 20/l, 100), *vihuela de péñola* (three-stringed long-necked lute, with plectrum) (140), **viola arábica* (bowed oval-shaped fiddle, shown with three and four stringed its actual identity is problematic)(210), and *zanfona* (*cinfonía*, hurdy-gurdy; a

three-stringed mechanically bowed fiddle) (160); (b) the zither family: **canon entero* (Arabic *qanūn*)(wing-shaped and rectangular (70 and 80, respectively), *cedra* or *cítara* (290), **medio canon* (trapezoidal)(50), and **rota medieval* (triangular-shaped)(40); and (c) the harp family: *arpa gótica* (380).

Next follow the winds (aerophones), representing thirteen distinct types among the thirty-two depicted. These include (a) a natural horn: *corneta curva* (with a mouthpiece; perhaps with finger holes)(270); (b) trumpets: **trompa árabe*, *añafil* or *trompeta recta* (Arabic, *al-nafir*)(320, 360); (c) single-reed instruments:

Cantiga de loor, no. 340: "Virgen madre gloriosa," from the «Códice rico» de las Cantigas de Alfonso X el Sablo (Ms. T.I.1 from the Library at El Escorial, Spain, Fol. 304C.)

launeddas (from Sardinia; triple-piped, one pipe of which functions as a drone)(60); (d) double-reed: **al-bogón* (large shawm with extended bell)(300/l), *caramillo* (small shawm)(340/l), **albogue* (Arabic, *al-buq*) (shawm, forerunner of the *dulzaina*)(310, 330/l, 340/r, 390), *chorus* or *chorón* (bladder pipe with chanter, shown with and without drones (250 and 230, respectively), *gaita* or *cornamusa* (bagpipe with chanter and drone)(350), and *odrecillo* (small bagpipe with chanter, shown with and without drones)(280 and 260, respectively); (e) flutes: *flauta travesera* (transverse flute; it has been linked to the **axe-baba morisca*); (Arabic *al-shabbaba*) (240) and *flautilla* (three-holed whistle-flageolet or pipe)(370); and (f) organ: *organo portátil* (portative organ with bellows)(200). The aerophones exhibited in *Cantigas de loor* 220 and 360 are enigmatic. The former, described by some as a *flauta doble* or *doble chirimía*, was studied by Torres, who linked it with the *launeddas* and suggested that its semicircular portion functions as a bellows. The latter, exhibiting two instrumentalists, each blowing two straight trumpets at the same time, appears somewhat questionable.

Finally the percussion instruments constitute four distinct types among the eight depicted: (a) struck idiophones: *campanas* or *carillón* (bell chimes, struck on rim and manipulated by internal clappers)(180 and 400, respectively), **címbaros* or *platillos* (cymbals) (190), and *tejoletas* (a precursor of the castanets)(330/r); (b) membranophones: **tambor de doble cono* (Arabic, *darabukka*; single-headed hour glass-shaped drum)(300/r), and *tamboril* or *tamborete* (small cylindrical drum), shown as played in conjunction with the *flautillo* (370). The combination of pipe and tabor can be traced to the thirteenth century.

Among the more recent studies concerning B.I.2, Álvarez suggests that the musical miniatures were drawn by seven distinct hands: (1) nos. 1–40; (2) 60–80, 360–400; (3) 120–70, 290, 300, and 340; (4) 210–250, 320, and 350; (5) 50, 90–110, 190–200, 280, and 330; (6) 180 and 310; and (7) 260 and 270. Martínez and Le Vot discuss the same miniatures from the standpoint of their visual presentations (symmetry, parallelism, etc.), which may account for the inaccurate manner certain instruments were shown to be played; notice, for example, the hand positions among the wind players. In terms of detail, one must also consider the artist's personal familiarity with the instruments he depicted, as well as his sense of perspective and proportion.

Escorial Codex T.I.1 (or E²) duplicates ten of the aforementioned instruments, among which the *vihuelas de arco* (*Prólogo*, *Cantigas* 8 and 14, and *Cantiga de loor* 120) and the *añafles* (*Cantigas* 62, 165,

and 185) play a prominent role. The **atabal* (Ar. *naqqara*) (kettledrum), a pair of which can be seen in *Cantiga* 165, is the only addition. A comparison of its *Prólogo* with *Cantiga de loor* 1 (in B.I.2), reveals distinct artistic versions of the king supervising a rehearsal in progress. In the former he is flanked on his right by a scribe and three *juglares*; on his left by a scribe and four choristers. In the latter, to his right are four choristers and two *juglares*; to his left a scribe, three choristers, and two *juglares*. The latter miniature is significant in that one of the choristers is holding a text, implying the role of soloist. The *juglares* employed at the court were indeed proficient musicians who not only provided heterophonic accompaniments but were also adept in adding improvised preludes, interludes, and postludes to the performances.

Codex T.I.1 also bears testimony to two other ensembles that were utilized for performance: the first, distinctly Arabic (*Cantiga de loor* 100), comprising a *rabé morisco*, *laúd*, *canon medio*, *rota medieval*, and *címbaros*, with what appears to be a chorus singing behind them; the second, consisting of a *vihuela de arco*, *albogue*, *rota medieval*, and two *canons* (*entero* and *medio*) includes dancers and possibly singers.

Many of the above instruments were included among the thirty-seven mentioned in the *Libro de buen amor*.

ALFONSO X, EL SABIO, KING OF CASTILE AND LEÓN, MUSIC OF CANTIGAS

Higinio Anglés's monumental study and transcription of the *Cantigas de Santa Maria* (Barcelona, 1943–1964) provided, for the first time, easy access to the combined repertoires of the three musical codices (Toledo, T.I.1, and B.I.2), thus promoting worldwide interest in their performance. Despite its shortcomings,

this indispensable guide must be consulted for subsequent research.

Of the various figures adduced by scholars for the total number of *cantigas* melodies (narratives and *loors* alike), 413 is accurate and includes 403 tunes from Codex B.I.2, plus ten additional tunes for the *Fiestas de Jesucristo* from the Toledo Codex. In Codex B.I.2, seven texts and tunes are repeated (165 = 395, 187 = 394, 192 = 397, 267 = 373, 289 = 396, 295 = 388, 349 = 397), while one *cantiga* and two *Fiestas de loor de Santa Maria* share their melodies with other *cantigas* (213 = 377, FSM 2 = 340 and FSM 6 = 210, respectively). Lacking music are *cantigas* 298, 365, 401 (*Piticon*), and 402. In the case of 401, its melody can be found in the Toledo and T.I.1 codices. Of the 193 *Cantigas* texts in Codex T.I.1, all but two (nos. 113 and 146) carry the same melodies as those in B.I.2. The Toledo Codex comprises 128 melodies, 104 and 118 of which are duplicated in T.I.1 and B.I.2, respectively. In the Toledo, only the refrains and single strophes bear musical notation, whereas additional strophes have been notated in the Escorial codices. The Florentine Codex, MS Banco Rari 20, was prepared to incorporate music, but unfortunately its musical staves remained bare.

Two melodic styles can be readily identified from the notation: syllabic (basically one tone per textual syllable) and neumatic (wherein compound and ligated neumes feature prominently, comprising two to five tones or more per textual syllable). The notational values (*longa–breve*) of the Escorial Codices were halved in the Toledo (*breve–semibreve*), considered by Anglés to be the least perfect of the three manuscripts. Whereas the neumes depict the melodic progressions of each tune with great precision, it is their rhythmic interpretation that has provoked much controversy, particularly those in the neumatic style. Anglés considered the Escorial Codices to be fully notated in mensural notation, reflecting both strict modal (particularly trochaic, iambic, and dactylic) and mixed modal rhythms. Among the nonmodal, he discovered that binary rhythms surpass the ternary, and that combinations of both exist. In his view, the single neumes of the Toledo Codex carried mensural values, while the compound and ligated neumes did not. With regard to Anglés's transcriptions, H. van der Werf found that he adhered as often to the medieval rules of mensural notation as he departed from them and that the Escorial Codices were decidedly nonmensural. Furthermore, van der Werf suggested that the *Cantigas* should be rendered in a declamatory rhythm to best reflect the textual accents that were not fully articulated in Anglés's transcriptions.

Among the forms in the *Cantigas* repertory, the rondel types (comprising the *formes-fixes*) of late medieval French poetry predominate. Of these the *virelai* is most conspicuous. Anglés listed its occurrence in 368 instances (88 percent of the collection) and recently G. V. Huseby extended the count to 382 (92 percent). The *ballade* and *rondeau* follow, with five occurrences each. Inasmuch as Anglés's analysis of the remaining forms were somewhat questionable, a more recent accounting includes such genres as *canções* (songs) with refrain, hymns, sequences, and a *cantiga de amigo* (song of love).

The *virelai*'s primacy not only reflected the high esteem which it held at Alfonso's court, but shows that it was clearly intended as a vehicle for disseminating the Marian narratives and lyrical texts. Comprising an *estribillo* (refrain), *mudanza* (strophe), and *vuelta* (continuation of strophe sung to the melody of the refrain), the *virelai* aptly suits a rendition alternating between soloist and chorus, with the latter merely reiterating the refrain text. Although the *virelais* appear as tripartite melodies (wherein repetition and contrast can be depicted simply as ABA, and in such variant forms as AA BBAA, AB BBAB, AB CCAB, etc.), closer study reveals that common melodic formulas were shared by a number of them. Moreover, the *mudanza* was normally notated in a higher range than the *estribillo*, exhibiting an arch-like contour.

The predominance of the *zajal*'s (Sp. *zéjel*) metrical form in association with the *virelai* (about 360 occurrences) has led to two diametrically-opposed arguments concerning *virelai*'s origin—either from the south (Andalusia), from whence the *zajal* influenced the northern form, or vice-versa. A mutually independent genesis has also been proposed. Still, the crucial factor is the lack of musical documentation from Muslim sources.

The following diagram illustrates a fundamental difference between the *virelai* and *zajal*, musically (upper case) and metrically (rhyme scheme, lower case):

	<i>Virelai</i>	<i>Zajal</i>	(<i>Cantiga</i> 86)
<i>Estribillo</i>	A a	A a	[Ar. <i>Matla</i>]
	A a	B a	
<i>Mudanza</i>	B b	A' b	[Ar. <i>Gusn</i>]
	B b	A' b	
<i>Vuelta</i>	A b	A'' b	[Ar. <i>Simt</i>]
	A' a	B a	

a) *Cantiga de loor 340: "Virgen madre groriosa"* (Anglés 1943, 2: 371), b) *Giraut de Bornelh "Reis glorios..."* (Fernández de la Cuesta 1979, 169) and c) *Cadenet "S'anc fui bèla ni presada"* (Fernández de la Cuesta 1979, 548)

a) *Cantiga de loor 340: "Virgen madre groriosa"* (Anglés 1943, 2: 371), b) *Giraut de Bornelh "Reis glorios..."* (Fernández de la Cuesta 1979, 169) and c) *Cadenet "S'anc fui bèla ni presada"* (Fernández de la Cuesta 1979, 548)

In the *Cantigas* corpus, musical counterparts for the *zajal* (like that in *Cantiga 86*, shown above) can also be found in *Cantigas 61, 80, 96, 102, 111, 168, 299, and 320*.

The melodic origins of the *Cantigas* have been traced to three traditions: court (troubadoursque), popular, and liturgical. Nearly thirty of the tunes have been partially linked to preexistent melodies. *Cantiga de loor 340* (see fig. 1) furnishes an excellent example of a tune contrafact that can be traced to the famous *alba* "Reis glorios" by Giraut de Bornelh (ca. 1173–1220) and upon which Cadenet (fl. 1204–1235) based his "S'ans fue belha ni presada."

Other musicologists who have contributed significantly to *Cantigas* research are Ismael Fernández de la Cuesta, Manuel P. Ferreira, Gerardo V. Huseby, José María Llorens Cisteró, and Zoltán Falvy.

ALFONSO X, EL SABIO, KING OF CASTILE AND LEÓN, POETRY

Alfonso X (1221–1284) spent his early years, like his father before him, in Galicia before going to court. The dominant lyric voice in the western two-thirds of the Iberian Peninsula for poets of all languages was Galician-Portuguese from approximately 1180 to 1325. Alfonso's early years coincided with the Albigensian persecutions in France, which increased the presence of Occitan (or Provençal) poets in the courts of Iberia. Thus, both Galician-Portuguese and Occitan poets (and members of their entourages) were frequently to be heard entertaining in the courts ruled over by Alfonso VII, Alfonso VIII, Jaime I (Alfonso's father-in-law), and Fernando III. Since Alfonso X was accustomed to singers and composers all his life, and praised his father for these talents in his *Setenario*, it is not surprising that this young prince, so drawn to letters in general, and remembered even now as an "emperor of culture," should have himself become a poet.

Alfonso is responsible, first, for a small body of profane poetry, some forty-six poems in all. From the main genres associated with Galician-Portuguese verse (*cantigas d'escarnho e de maldizer*; *cantigas d'amor*; *cantigas d'amigo*) almost all his production falls into the first category of mostly satirical verse: there is one composition ("Senhora, por amor Deus")—the only one in Castilian—that seems to be about love. The remaining poems present a gallery of types, rich and varied satires of cowards, prostitutes (he was one of many poets to extol the "virtues" of one María Balteira), fops, bad poets, lascivious prelates, promise breakers, and more. The language is direct, vivid, and unflinching in its realism. A small number of the compositions (four) are *tensons*, dialogues between two poetic personae, one created by Alfonso and one by another poet. The tone established is nearly always only semiserious; the ludic, mocking voice pokes holes in the facade of well-known types (often individuals are named) while offering, at the same time, a celebration of the poetic virtuosity on display in the medieval Galician-Portuguese *cancioneiros*.

Alfonso is best known, however, for his *Cantigas de Santa María*. These were composed in a span extending from about 1250 to 1280 and almost certainly involved poets other than Alfonso. An early form (the Toledo manuscript) contains a core of one hundred poems, arranged in decades of nine narrations of the Virgin Mary's miraculous interventions in human af-

fairs plus one praise song or *loor*. There are two introductory poems, one with a third-person voice telling us that Alfonso was the maker of these poems, the second using a first-person approach and narrating how difficult is the task of ever praising Mary sufficiently. In this prologue poem, the tone is set by a poetic persona who, casting aside all other women, adopts the troubadour stance of supplicant before his Lady, promising to serve her alone. The voice of this poetic persona is then interwoven into the collection as it grows, in various stages, to comprise forty-two decades of miracle-plus-praise song, with small additional bodies of poems dedicated to the feasts of Mary and the feasts of her son.

Justly, the *Cantigas de Santa María* has been described as the aesthetic Bible of the thirteenth century. While the Toledo manuscript has one presentation miniature depicting Alfonso surrounded by scribes and musicians in the act of composition, as well as musical transcriptions of the melodies, two other expanded editions are more lavishly illustrated and musicated. One, in two parts (located in El Escorial and Florence) contains lavish miniatures, some sixteen hundred in all, that opens windows on virtually all aspects of Alfonso's world. The musical transcription is extensive but, as with the miniatures, begins to be more sporadic toward the end of what remains an incomplete undertaking. The remaining MS, also in El Escorial, contains forty-two miniatures of musicians of both sexes and, doubtless, the three religious groups (Christians, Moors, and Jews) present at court. A majority of the *cantigas* are variants of the *zéjel* with refrain (AA bbba AA ccca, etc.) but musically show an affinity with the French *virelai* form.

The *Cantigas* contain miracle narrations that were conscientiously culled from sources in both Latin and the vernaculars that circulated widely throughout Europe and other areas of the peninsula (Montserrat in Catalonia, Terena in Portugal, Puerto de Santa María in Andalusia). But perhaps more significant is the presence of Alfonso in the collection. Many miracle accounts tell of cures for his parents, of favors Mary performs for other family members, of special rewards that Alfonso's great devotion and loyalty to Mary bring (there are several cures, many favors granted in battle). In the end, the royal presence blends with the notion of the poetic persona in service to his liege lady, the service being—at least in part—this very compilation, intended also to foment the praises of Mary to others who have witnessed how she has rewarded his service. Alfonso also had himself depicted frequently, in the miniatures that accompany the *loores*, in various postures of praise of Mary, throughout the liturgical year. Alfonso, like all sinners that appear in this vast compilation, is equal in Mary's human-yet-divine presence.

There is, ultimately, a sense, most marked in *cantiga* 409, of all humanity celebrating, hands joined, singing and dancing, the hope that Mary brings of salvation from sin. It may be inferred that the *Cantigas de Santa María* were intended not as yet one more Marian compilation, but as an unsurpassingly rich evocation of her universal presence as felt in the life of the peninsula and, especially, in the spiritual and political affairs of its compiler.

ALFONSO X, EL SABIO, KING OF CASTILE AND LEÓN, POLITICAL HISTORY

Alfonso X, king of León-Castile (1252–1284), the son of Fernando III and Beatrice of Swabia, was born on 23 November 1221 in Toledo and is known as El Sabio, the wise or the learned. His first task was to complete the colonization of Seville and the recently reconquered territory in Andalusia. An ambitious ruler, he also tried to assert his supremacy over neighboring Christian territories. He quarreled with Afonso III of Portugal over lands east of the Guadiana River and the Algarve, but reached a preliminary settlement in 1253 by arranging the marriage of his illegitimate daughter, Beatriz, to the Portuguese ruler. When Alfonso X demanded that Thibault II, the new king of Navarre, become his vassal, the Navarrese appealed for help to Jaime I of Aragón. As a consequence, Alfonso X had to give up his attempt to subjugate Navarre in 1256. He also had alleged rights to Gascony, but yielded them in 1254 to his sister Leonor and her husband Edward, the son and heir of Henry III of England.

Advancing claims to the Holy Roman Empire derived from his mother Beatrice, daughter of Emperor Philip of Swabia, Alfonso X was elected in 1257 in opposition to Richard of Cornwall. He incurred great expenses in a vain effort to win recognition, but he was unable to persuade the majority of the Germans and several popes to acknowledge him.

Alfonso X also planned an invasion of Morocco to deprive the Moors of easy access to the peninsula,

but his African crusade accomplished nothing more than the plundering of Sale, a town on the Atlantic coast, in 1260. In order to broaden Castilian access to the sea, he developed Cádiz and the nearby Puerto de Santa María and conquered Niebla in 1262. When he demanded the surrender of Gibraltar and Tarifa, his vassal, Ibn al-Aḥmar, King of Granada, refused, because he realized that this would make it difficult for Morocco to aid Granada against Castile.

Threatened by Castilian expansion, Ibn al-Aḥmar in the spring of 1264 stirred up rebellion among the Mudejars or Muslims subject to Castilian rule in Andalusia and Murcia. Alfonso X took steps to contain the revolt in Andalusia, while appealing for help to his father-in-law, Jaime I of Aragón, who subdued Murcia by early 1266. Jerez, the last rebel stronghold in Andalusia, capitulated in October. As a result of the rebellion, the king expelled the Muslims from the recaptured towns and brought in Christian settlers. The suppression of the revolt was completed when Ibn al-Aḥmar resumed payment of a yearly tribute to Castile in 1267. In that same year, Alfonso X, in return for Alfonso III's assistance in crushing the revolt, yielded all rights in the Algarve and agreed to a delimitation of the frontier with Portugal along the Guadiana River to the Atlantic Ocean.

Although tranquility was restored, Alfonso X soon encountered strong domestic opposition because of his innovations in law and taxation. Intent on achieving greater juridical uniformity, he drew upon Roman law in preparing the *Espéculo de las Leyes* (known in its later redaction as the *Siete Partidas*), intended as the law of the royal court, and the *Fuero Real*, a code of municipal law. The nobles accused him of denying them the right to be judged by their peers in accordance with their customs, and the townsmen were distressed by frequent imposition of extraordinary taxes.

Under the leadership of the king's brother Felipe, the nobles confronted the king during the *cortes* (parliament) of Burgos in 1272. By confirming traditional customs, he modified his plan for a uniform body of law, but as compensation, the towns granted him a tax levy every year for "the affair of the empire." Despite his efforts at accommodation many of the nobles went into exile to Granada, but were finally persuaded to return to royal service in 1274. With his realm at peace, Alfonso X then journeyed to Beaucaire in southern France, where in May 1275 he vainly tried to convince Pope Gregory X to recognize him as Holy Roman Emperor. Thereafter Alfonso X could not realistically expect to satisfy his imperial ambitions.

During his absence, Abū Yūsuf, the Marīnid emir of Morocco, invaded Castile. The king's son and heir, Fernando de la Cerda, died suddenly en route to the frontier in 1275, and Abū Yūsuf routed the Castilian

forces. At that point, Alfonso X's second son, Sancho, reorganized the defense, cutting Marīnid communications with Morocco. A truce was arrived at, but Abū Yūsuf invaded again in 1277. Avoiding a battlefield encounter, Alfonso X blockaded Algeciras in 1278, but had to give it up early in 1279. In spite of the Moroccan threat, Castile emerged from this crisis without a loss of territory.

Meanwhile, the death of his oldest son in 1275 presented Alfonso X with a serious juridical problem. Fernando de la Cerda's oldest child, Alfonso, could claim recognition as heir to the throne, but Sancho appealed to the older custom that gave preference to a king's surviving sons. After much debate, the king in the *cortes* of Burgos in 1276 acknowledged Sancho. Fearing for the safety of her two sons, Fernando de la Cerda's widow, Blanche, accompanied by Queen Violante, took them in 1278 to the court of Violante's brother, Pedro III of Aragón, who kept them in protective custody.

Philip III of France, the uncle of the two boys, pressured Alfonso X to partition his realm and to establish a vassal kingdom for Alfonso de la Cerda. During the *cortes* of Seville in 1281, while the people complained that they were being impoverished by the heavy taxes, Sancho, angered by the possibility of losing any portion of the kingdom broke with his father. A public assembly held at Valladolid in April 1282 transferred royal power to Sancho, leaving Alfonso X only the royal title. Abandoned by his family and many of his subjects, the king turned to Abū Yūsuf, the Marīnid emir, who invaded Castile again. As many of Sancho's supporters renewed their allegiance to the king, a vain attempt at reconciliation was made, but in his last will Alfonso X disinherited his son. The king died at Seville on 4 April 1284 and was buried in the cathedral.

Despite the unhappy end to his reign Alfonso X was one of the greatest medieval kings of Castile, and his impact on the development of Spanish law and institutions was lasting.

ALFONSO X, EL SABIO, KING OF CASTILE AND LEÓN, SCIENCE

Alfonso X had already begun his career as a great medieval Maecenas two years prior to ascending to the throne of Castile and León, if the date provided in his

Lapidario is accurate. Although date and form of this work pose some, as yet, unresolved problems, it is certain that the *Lapidario* incorporates one aspect of the medieval discipline that the learned monarch must have held most dearly—astronomy and astrology. To categorize Alfonso's interest in astrology as marginal is inaccurate and anachronistic since the two in Alfonsine usage were essentially, although not entirely, synonymous. When Alfonso did distinguish between the two, more often than not *astronomía* meant "astrology" and vice versa. Thus, to emphasize a distinction between what is today the science of astronomy and the art (at best) of astrology is counterproductive, for astrology was virtually applied astronomy. If astronomy enabled one to calculate the positions of heavenly bodies, astrology allowed one to interpret the significance of a particular configuration. Alfonso makes amply clear in the writings he sponsored that God had placed the stars and planets in the heavens so that the intelligent man, his "omne entendudo," might exploit them to attain his goals. A modern analogue to astrology is radar. Just as it would be foolish, if not suicidal, for a pilot to eschew its use, so was it for a medieval king to shun astrology.

Thus, it is not surprising that eight of thirteen different titles that Alfonso sponsored pertain exclusively to Alfonsine science. These are: *Lapidario* (ca. 1250), *Tablas alfonsíes* (1252), *Libro conplido en los iudizios de las estrellas* (1254), *Libro de las cruces* (1259), the so-called *Picatrix* (ca. 1250s), *Canones de Albateni* (ca. 1250s), *Libro del saber de astrologia* (1276–1277; most commonly and erroneously known as *Libros del saber de astronomía*), and *Libro de las formas et de las ymagenes* (1276–1279). These eight titles expand to twenty-seven if we realize that two of these codices are anthologies. The *Canones de Albateni* in fact contains four treatises—*Canones de Albateni*, *Tablas de Albateni*, *Tablas de Azarquiel*, and *Tratado del quadrante sennero*. The *Libro del saber de astrologia* comprises sixteen titles: *Libro de las estrellas del ochauo cielo* (1256), *Libro de la espera* (1259), *Capitulo pora fazer armillas en la espera*, *Libro del astrolabio redondo*, *Libro del astrolabio llano*, *Libro de la lamina universal*, *Libro de la acafeha* (1255 second half, or 1256 first half), *Libro de las armillas*, *Libro de las siete planetas*, *Libro del quadrante*, *Libro de la piedra de la sombra*, *Libro del reloj de la agua*, *Libro del reloj de la argent vivo*, *Libro del reloj de la candelá*, *Libro del palacio de las horas*, and *Libro del ataçir*. The three followed by parenthetical dates were originally commissioned as indicated.

Noteworthy is that only two of the works, *Libro del saber* and *Libro de las formas*, were compiled in the 1270s. Also noteworthy is that the remaining six

titles hale from the 1250s and were predominantly astrological. The *Lapidario* treats the magico-medicinal properties of stones. The *Picatrix* concerns talismanic magic. The *Iudizios* and *Cruces* treat judicial astrology, the latter specifically as it pertains to a king—providing information such as the most propitious time to wage war, for example. Even astronomical tables had an astrological function—ease of prediction, that is, knowing the arrangement of the heavenly configurations not only without having to actually sight them, but especially beforehand. Astrology, thus, while serving Alfonso's practical purposes, on a larger scale, provided a powerful motive for the very basis of empirical science—observation.

Alfonso may have conceived of his final two science treatises, the *Libro del saber* and the *Libro de las formas*, as complementary anthologies—the former on the construction and use of instruments of astronomical observation and mensuration, the latter on practical astrological applications. Judging from the limited information retrievable from the fourteen-folio fragment, all that remains of the *Formas*, it is safe to say that it, like the *Libro del saber*, incorporates versions, possibly revised, of works compiled originally in the 1250s.

Ironically, Alfonso X owes his recognition in science to his *Tablas alfonsíes*, a work whose translation into Latin greatly enhanced its diffusion, whose interest lies in its application to astrological reckonings, and whose text does not survive, as do all his other science treatises, in a codex produced in his royal scriptorium.

ALFONSO XI, KING OF CASTILE AND LEÓN

Alfonso XI, king of Castile and León (1312–1350), the son of Fernando IV and Constanza of Portugal, was born at Toro on 13 August 1311. On his father's untimely death he succeeded to the throne at the age of slightly more than one year. His minority, lasting thirteen years, was a time of terrible stress, as the king's relatives vied for control of the regency. As a measure of the disorder, the towns, anxious to defend their liberties and to uphold the king's authority, revived the associations or *hermandades* that they had

formed in similar times of crisis in the late thirteenth century. When the *cortes* (parliament) of Palencia assembled in 1313 to determine who should act as regent, some members recognized the king's great-uncle, Juan, while others accepted the king's grandmother, María de Molina, and her son, Pedro. After the death of Queen Constanza, who had custody of her son, María de Molina emerged as the principal champion of royal authority and guardian of the king. The contending regents eventually agreed to a unified regency in the *cortes* of Burgos in 1315, in which the *hermandades* played an influential role. Confusion and turmoil continued, however, as discontented persons worked toward their own advantage. As some measure of tranquility was established, infantes Pedro and Juan planned a joint campaign against the kingdom of Granada, but in 1319 both men died suddenly. Immediately the struggle for the regency resumed.

Once again, various members of the royal family, including Juan, son of the deceased Infante Juan, Felipe, brother of Infante Pedro, and Juan Manuel, a grandson of Fernando III and a figure famous in the history of Castilian literature, demanded a place in the regency. María de Molina tried to maintain some degree of order, but her death in 1321 removed the last restraint. As the self-proclaimed regents effectively divided the realm among themselves, law and order broke down entirely.

When Alfonso XI reached the age of fourteen in 1325 he boldly declared his minority at an end and called for the resignation of the three regents. Though still inexperienced, he thwarted their ambitions to control him, executing his cousin, Juan, and breaking his engagement to the daughter of Juan Manuel, who had expected that the marriage would enable him to dominate the king. Instead, Alfonso XI in 1328 married María, daughter of Afonso IV of Portugal, who pledged to join him in war against the Moors. Juan Manuel, considering himself betrayed, fled to Aragón but renewed his allegiance in 1329; thereafter his relationship with the king was always uncertain. When Alfonso de la Cerda acknowledged the king, pledging homage and fealty in 1331, a chapter in the long dynastic dispute stemming from the reign of Alfonso X was closed.

With his realm comparatively at peace, Alfonso XI, aided by Aragón and Portugal, planned to resume the war of reconquest. He seized several fortresses on the western frontier of the kingdom of Granada in 1327 and 1330, prompting Muḥammad IV to appeal to the Marinids in Morocco for help. Responding with enthusiasm, the Moroccans laid siege to Gibraltar and captured it at the end of five months in June 1333. Alfonso XI vainly tried to relieve the garrison and to recover

the fortress after it capitulated, but he was distracted by continued discontent among the nobility and tense relations with his Christian neighbors. By inviting the Marīnids into his kingdom, Muḥammad IV angered the Granadan nobility, who feared Moroccan domination; they assassinated their king and elevated his brother, Yūsuf I. Soon later, Castile, Morocco, and Granada agreed to a truce.

While Alfonso IV of Aragón was irritated by Afonso XI's presumption in military affairs, Afonso IV of Portugal was becoming outright hostile and conspired with Juan Manuel against the king of Castile. The Portuguese monarch believed that Alfonso XI, by openly flaunting his relationship with Leonor de Guzmán, the mother of his several illegitimate children, was dishonoring the queen, Maria of Portugal. Desultory warfare between Castile and Portugal followed, but Portuguese efforts to persuade Alfonso IV of Aragón to enter an alliance against Alfonso XI were of no avail.

As the truce with the Moors drew to a close, the Christian rulers realized that they were all threatened by the possibility of a new Moroccan offensive, and decided to set their own quarrels aside for the time being as they planned for a common defense of the peninsula. Although the Castilian and Aragonese fleet won a victory over the Moroccans in the straits in 1339, they were unable to prevent the sultan, Abū-l-Ḥasan, from invading Spain with a substantial army in the spring of 1340. Aided by Yūsuf I of Granada, he began the siege of Tarifa in June. Gathering his forces, Alfonso XI appealed to the pope for crusading indulgences and financial assistance. Warriors from the other peninsular realms and from northern European countries, hoping to distinguish themselves in a crusade, came to lend their support. Once again, Pedro IV of Aragón sent a fleet, while Afonso IV personally commanded Portuguese troops who joined the host.

Warned of the advancing Christian army, the Moors abandoned the siege of Tarifa and prepared to give battle on the banks of the nearby River Salado. Blessing the Christian soldiers, Gil de Albornoz, the archbishop of Toledo, assured Alfonso XI that victory awaited him and urged him to go forth without fear. In the ensuing conflict, which took place on 30 October 1340, Afonso IV and the Portuguese drove the Granadan troops from the battlefield while Alfonso XI dispersed the Moroccans. The thorough Christian victory delivered a decisive blow to Moroccan aspirations to dominate the peninsula. Christian Spain was liberated once and for all from the threat of invasion from Morocco. The Christians had triumphed in the long battle to control the Strait of Gibraltar and to deprive the Marīnids of easy access to the peninsula. As the Mo-

roccan menace was perceived to recede, the need to complete the peninsular reconquest was not felt so urgently and eventually was allowed to fall into abeyance.

For the moment, however, an exuberant Alfonso XI intended to continue the war. Sending the trophies of war to the pope, he pleaded for continued spiritual and financial support of his crusade. In 1341 he seized Alcalá de Benzayde, Rute, Priego, Benamejí, and Matrera to the northwest of Granada. Then, in August 1342, supported financially by the pope and the king of France, and with ships supplied by Portugal, Aragón, and Genoa, he began the siege of Algeciras, one of the principal points of entry into the peninsula. Once again, he was joined by foreign soldiers, including Philip d'Evreux, king of Navarre, who died in 1343, the count of Foix, and the Earls of Derby and Salisbury. In November 1343 Alfonso XI gained a decisive victory over the Moroccan and Granadan forces on the river Palmones, eliminating any possibility of relief for Algeciras. With the permission of the emir of Morocco, the defenders surrendered Algeciras on 26 March 1344.

The reaching of a truce gave the king an opportunity to replenish his treasury and to prepare for the resumption of hostilities. As the Marínids still held Gibraltar, the king lay siege to that fortress in August 1349. The Black Death, the great plague that devastated western Europe, ravaged his camp, however, and he fell victim to it, dying on 27 March 1350 at the age of thirty-nine.

Aside from his military labors, Alfonso XI took steps to strengthen the monarchy by imposing stricter and more direct control on the towns by sending *corregidores* or royal administrators to control their affairs. He also resolved much of the confusion in the administration of justice by the Ordinance of Alcalá enacted in the *cortes* of Alcalá de Henares in 1348. Fearful of the *cortes*, which met frequently during his minority, he convened that assembly in full only three times during his majority, but otherwise preferred to convene partial assemblies, thus effectively dividing the estates, while getting what he wanted in taxes. His principal innovation in taxation was the introduction in the years 1342–1345 of the *alcabala*, a sales tax that became the most important source of revenue for the crown thereafter.

Alfonso XI had two legitimate sons, Fernando, who died as an infant in 1333, and Pedro, born on 30 August 1334, who succeeded him. He also had ten illegitimate children by Leonor de Guzmán; the most important of them was Enrique of Trastámara, who after overthrowing Pedro gained the throne as Enrique II (1369–1379).

ALFONSO, INFANTE OF CASTILE

Born in 1453, Alfonso was the son of Juan II of Castile and his second wife, Isabel of Portugal, the brother of Isabel the Catholic, and the half-brother of Enrique IV. Since he died in 1468 at age fourteen, he remains a shadowy figure whose importance was due to the way in which he was used as a pawn in the political disturbances that plagued Castile. That rebellious nobles could manipulate him is to be explained by several factors. It was argued, for example, that as long as Enrique IV remained childless Alfonso was heir to the throne. And when Enrique IV's second wife, Juana of Portugal, did give birth to a daughter it was claimed that the child's father was not the king, but Beltrán de la Cueva (hence, she was often referred to as Juana la Beltraneja), and that Alfonso was still heir to the throne. Moreover, whatever the truth about the many accusations leveled against Enrique IV, the young Alfonso could be presented as an "honest" alternative to a king who was alleged to be morally, sexually, and religiously corrupt. Matters came to a head when the rebel nobility sent a list of grievances and demands for reform to the king in 1464. The latter at first accepted these, but then retracted. There followed the famous Sentencia of Medina del Campo of 1465, a purportedly "neutral" attempt at reform, and the infamous deposition in effigy of Enrique IV, known as the Farce of Avila, that took place on 5 June of the same year. A large platform was erected outside the walls of Avila and a wooden statue of Enrique IV, decked out with the symbols of royalty, was placed on a throne. The leading rebels, who included such powerful men as Alfonso Carrillo, Archbishop of Toledo; Juan Pacheco, Marquis of Villena, Alvaro de Stúñiga, Count of Plasencia; Gómez de Solís, Master of Alcántara; Rodrigo Pimentel, Count of Benavente; and Rodrigo Manrique, Count of Paredes, then proceeded to strip the statue of its symbols, and after the deposition in effigy had been carried out Alfonso was taken up on to the platform and proclaimed king. But of course Enrique IV and his supporters denounced the Farce of Avila, and the two rival kings plunged Castile into anarchy. Just over three years later Alfonso unexpectedly died on 5 July 1468 at Cardeñosa, a village near Avila.

Alfonso may have died of the plague or he may have been poisoned. There had been an epidemic in the region, but there was some cause to believe in the

theory of poisoning. Although his supporters were said to be grief stricken, it was also noted that those who had been manipulating Alfonso were finding that he was less malleable than his half-brother: hence the suspicion that they “dispatched” Alfonso in order once again to control the kingdom through the pliant Enrique IV. There is some evidence that Alfonso had been starting to display qualities that were not those of a “pawn” but rather those that his sister Isabel would later display on the chessboard of Castilian politics as queen. Nevertheless he had been manipulated, and there were many who grieved the death of Alfonso “the Innocent.”

ALHAMBRA

Citadel and palace dominating Granada from the south and comprising the most extensive remains of a medieval Islamic palace anywhere. It contains a virtual encyclopedia of Naṣrid architecture and decoration in glazed tile, carved and painted stucco, and wood, and is particularly notable for a group of superb *mugarnas* (stalactite) vaults. As early as the ninth century a citadel on the site was called *al-hamrā'* (the red), probably because of the reddish color of its walls. In the eleventh century it was linked with the town's defenses to the north, and between 1052 and 1056 Yūsuf Ibn Naḡhralah, the Jewish vizier to the Zirīd rulers of Granada, built his palace there. Two centuries later, the Naṣrid sultan Muḥammad I (r. 1230–1272) made the Alhambra his residence and over the next two centuries his descendants continued to enlarge and embellish it. Most of the Alhambra is due to Naṣrid patronage, particularly by Yūsuf I (r. 1333–1354) and Muḥammad V (r. 1354–1391, with interruptions), though Charles V (r. 1516–1556) added a palace in the Renaissance style, and Felipe V (r. 1700–1746) Italianized some rooms. The site subsequently fell into ruin, but it was rediscovered in the early nineteenth century by the Romantics, to whom are owed the names by which its parts are commonly known.

The Alhambra is contained within a walled enclosure (740 by 220 meters) punctuated with twenty-three towers and gates. At its western end is the Alcazaba (in Arabic *al-qasaba*, fortress); to the east are the remains of several palaces, a mosque, baths, and an industrial zone with a mint, tanneries, and ovens. Across

a ravine to the east of the enclosure are the palace and gardens of the *generalife* (in Arabic, *jīnan al-ʿarīf*, gardens of the overseer). The alcazaba, the oldest part, is a double-walled fortress of solid and vaulted towers containing barracks, cisterns, baths, houses, store-rooms, and a dungeon. Access from the north was controlled by the Armas gate; access from the south was controlled by the Gate of Justice (in Arabic, *sharīʿa*, erroneously for *shurayyaʿa*, esplanade), decorated with carved stone, cut brick, marble, and glazed tile. The Puerta del Vino, framed with ceramic spandrels and stucco panels, is a ceremonial portal to the main street of the royal quarter.

The core of the Alhambra, the so-called Casa Real Vieja (to distinguish it from the addition of Charles V), consists of several palaces arranged along the northern curtain wall and incorporating several of its towers. The palaces follow the traditions of palace design in the western Islamic world, with rooms arranged symmetrically around rectangular courts. One entered the Palace of the Myrtles from the large square facing the Alcazaba and passed through the first court, whose foundations indicate that it had an oratory and minaret, into the second, or Machuca, court. Only its northern portico and a tower survive; from it passages lead to a dwelling, another oratory, and the facade of the Mexuar (in Arabic, *mashwar*, place of the royal audience), the present public entrance. From the Mexuar, a rectangular room with a flat roof supported on six columns, one passes through a narrow doorway into the Cuarto Dorado, whose plain lateral walls emphasize and illuminate the splendid carved stucco facade at its south. This internal facade, crowned by windows allowing women to watch the activities unobserved and a mu-

Court of the Lions. 14th century. Naṣrid dynasty. Copyright © Adam Lubroth/Art Resource, NY Alhambra, Granada, Spain.

garnas cornice supporting deep eaves, presents the visitor with two identical doors: that on the right leads back to the Mashwar, while the other leads to a bent passage to the Court of the Myrtles. The court (36.6 by 23.5 meters) contains a long pool bordered by low hedges. Doors along the long walls open to rooms for the sovereign's wives, service areas, and the palace bath. At either end porticoes of seven arches on slender marble columns protect lavish tile and stucco decoration on the walls. A door in the center of the the northern portico opens to the Sala de la Barca, with a magnificent joined wooden ceiling, which was once the sovereign's bed- and sitting room. Beyond is the Hall of the Ambassadors, a large (11.3-meter) square room contained within one of the massive towers of the enclosure walls. Deep alcoves in its walls overlook the city; the one opposite the entrance is the most richly decorated, and the poem inscribed on its walls indicates that it was the throne recess. The floor and walls are superbly decorated with tile and carved plaster; the ceiling, composed of many thousands of individual wooden elements joined into a pyramidal vault, depicts

a starry sky and probably symbolizes the seven heavens of Paradise.

The area to the south of the Comares court was modified when Charles V constructed his palace there, but a street once led from the Mexuar past the royal mausoleum (*rawda*), a square building with a central lantern, to the Palace of the Lions. One passed from its entrance through a bent passage to the relatively intimate Court of the Lions (28.5 by 15.7 meters). An arcade supported on slender columns arranged singly or in groups of two, three, and four surrounds the court and the kiosks projecting at either end. At its center a fountain with twelve white marble lions (probably preserved from Yūsuf Ibn Naghrallah's palace) spout around an elevated polygonal basin inscribed with a poem by the Andalusian poet Ibn Zamrak (1333–ca. 1393). To the south is the square hall of the Abencer-rajés; squinches support a stellate drum and superb *mugarnas* vault, which also represent the dome of heaven. On the east of the court is the Hall of the Kings: alternately square and rectangular spaces with subsidiary side chambers separated by elaborate *mugarnas* arches and covered with painted and *mugarnas* vaults. To the north of the court is the Hall of the Two Sisters, a square hall with alcoves on its ground and first floors. *Mugarnas* squinches support an octagonal drum with eight paired windows and another superb *mugarnas* vault. From the hall one passes through another vaulted room to the exquisitely decorated belvedere of Lindaraxa overlooking the gardens below. Other palatial remains within the walls but outside the Casa Real Vieja include the Peinador tower, the Torre de la Cautiva, and the Partal palace.

ALHANDEGA, BATTLE OF

In 939 the Leonese king, Ramiro II (930–951) had been harassing and threatening the frontier possession of the caliphate of Córdoba for seven years. In 939 the Caliph 'Abd al-Rahmān III (912–961) resolved that the Leonese monarch must be punished severely and himself undertook the leadership of a strong army that marched north, reaching the banks of the Duero River near Simancas. There it encountered the army of Ramiro II, who had been reinforced with troops furnished by the Navarrese and Count Fernán González of Castile (923–970).

On 1 September a battle ensued that resulted in a resounding victory for Ramiro II. A large portion of the Muslim army was cut down, its camp captured, and 'Abd al-Rahmān's official Qur'ān and the caliph's ceremonial gold coat of mail formed part of the booty. The caliph himself escaped along with a substantial portion of his troops and returned to Córdoba. There he is said to have crucified three hundred officers of his cavalry for their cowardice. 'Abd al-Rahmān did not himself subsequently campaign against Ramiro II.

The battle seemingly takes its name from a field fortification built and utilized successfully by the Leonese at Albendiego near Simancas.

ALJAMA

Aljāma (rarely *alfama*) is a Spanish word derived from Arabic *al-jāmi'a*, "community." Many writers erroneously assume it refers exclusively to a Jewish community, but this is not in fact correct, for it refers to either a Muslim or Jewish community, and must therefore be qualified by one or the other adjective. The term may be either abstract, "the (Muslim or Jewish) community," or specific, referring to a particular community in a town or city and its physical neighborhood (*judería*), in later medieval usage, or *morería*.

The Muslim *aljāma* was originally rather loosely organized, but became increasingly bureaucratic over the centuries. Officials included the judges (religious and secular; almost indistinguishably the *faqīh* or *qāḍī*), with various minor magistrates, and the *Ṣaḥīb al-Shurṭa*, often erroneously translated as "chief of police" but in fact was a court administrator who also gave punishments (the term passed into medieval Spanish as *zavasorda*, merely a civil judge; Jews also held this post). There were also various market officials and supervisors of weights and measures, prices, and so on.

The Jewish *aljāma* was organized around an elected council, that could range from a simple "seven good men" to thirty or more. These were responsible for ordinances, tax assessments, and the like. *Adelantados*, or *muqaddamim*, were elected officials who carried out the actual daily administration. There were also special commissioners (*berurim*) to supervise and even adjudicate such matters as morals and the schools. There were also judges to handle all internal affairs of Jewish law.

Salaried officials sometimes included these judges, teachers of children, scribes, and sometimes

the slaughterers of meat. Rabbis, generally, were not salaried until later. Many Jewish *aljamas* had hospitals and/or charitable houses for the poor and elderly (*almosnas*) that were supported by taxes imposed by the Jewish council.

ALJAMIADO LITERATURE

Literature written in Spanish but employing the Arabic alphabet. The term derives from *aljamā* (in Arabic, *al-ʿajamiyya*), meaning "foreign language", "Romance language" in Spanish Arabic. Examples are extant from the fourteenth to the early seventeenth centuries, showing that this literature was cultivated by both Mudéjares and Moriscos. Continued use of the Arabic alphabet even after knowledge of the language itself was forgotten testifies to the Muslims' reverence for any manifestation of a tongue they considered holy. Also conventionally included in Aljamiado are the writings, in the Latin alphabet, of Spanish Moriscos exiled to North Africa after 1609.

The language of Aljamiado is almost exclusively Castilian, though many texts show a greater or lesser admixture of Aragonese. (The existence of a true Portuguese Aljamiado has been disproved.) Texts in Catalan or Valencian dialects are very rare, because although those regions had a large Muslim population it was for the most part Arabic-speaking. The Muslims of Castile and Aragón, more thinly spread within a Christian-dominated society, lost their Arabic fairly early, as is attested by the many surviving laments of authors and scribes. Nonetheless the texts contain many Arabic elements in the form of syntactic and semantic calques: *la isla de al Andalus* (the Iberian Peninsula; in Arabic, *jazīra*, meaning both "peninsula" and "island"); *ensañóse ensañamiento grande*, in imitation of the Arabic cognate accusative: *ya es a ti en que creas con Allah?* ("Have you [the will] to believe in God?") Likewise, vocabulary is borrowed freely and often adjusted to Spanish morphology: *halegar* (to create), in Arabic, *khalaka*; *el alhichante* (the pilgrim [to Mecca]), in Arabic, *al-hājj*; *los almalaques* (the angels), in Arabic (singular), *al-malak*. (Not coincidentally, all these terms are of Islamic import.)

Over two hundred Aljamiado manuscripts survive today; many of these were discovered inside the walls of houses in former Morisco villages of northeastern Spain, where the inhabitants had concealed them before their deportation. The largest such cache came to light in Almonacid de la Sierra (Zaragoza) in 1884,

the most recent in Urrea de Jalón (Zaragoza) in 1984. The principal library collections are those of the Escuela de Estudios Arabes, Biblioteca Nacional, and Real Academia de la Historia, all in Madrid.

Only a handful of names can be attached with certainty to Aljamiado works. The vast majority are anonymous, not only because *incipits* and *explicit*s have been lost (although of course many have) but because it is a literature that has evolved along collective and traditional lines. The author, rather than making his presence known, submerges his personality into that of the community from which he came and which forms his audience. Some of the stylistic features of Aljamiado, such as the second-person address to the hearers (e.g., *y veos aquí que . . .*) recall oral and popular forms of transmission.

The Aljamiado corpus contains many items that do not, strictly speaking, fall under the heading of literature. Among these are works of devotion (translations of the Qur'ān, collections of prayers, etc.) and works of superstition (such as charms, amulets, and the casting of horoscopes). But the line between the didactic or pietistic and the literary is not so neatly drawn as in the West: almost all Aljamiado works of the imagination are marked by a strong Islamic cast. The story of the Prophet Joseph (Yūsuf), for instance, which exists in both poetic and prose versions, follows the account in Qur'ān chapter 12, with embellishments taken from exegetical commentaries on the Qur'ān. There are lyric poems in praise of the prophet Muḥammad, and a long narrative one describing a pilgrimage to Mecca. Heroic tales and legends almost always turn on the adventures of Islamic heroes, such as the prophet's early adherents and his son-in-law 'Alī. Even Alexander the Great appears in the role the Arabs assign him, as Dhū-al-Ḳarnayn, transformed into a Muslim champion.

As is also clear from the above, the inspiration for this literature is overwhelmingly eastern. Its Mudéjar and Morisco authors did not originate, but continued and embellished, a relatively narrow range of themes. Only one important Aljamiado work has its roots in western Europe (see below).

Prose Narrative

Some of the more extensive works, and those of greatest literary worth, are *Rrekontamiento del rrey Ališandre*, the Islamic retelling of the Alexander legend; *Leyenda de Yūsuf*, of Qur'ānic inspiration; *Libro de las batallas*, heroic tales of the early days of Islam; and *Historia de los amores de Paris y Viana*, a version of a popular European novel of chivalry (and as such the only major Aljamiado tale of Western inspiration). The *Tafsira* of the Mancebo de Arévalo is at the same

time a guide to Islamic practice and the spiritual autobiography of a Morisco. Many short legends have been edited collectively. Some relate the deeds of early Islamic heroes or of biblical characters, others describe the Muslim vision of the afterlife. Collections of moral precepts form another category, as do works of divining and superstition such as *Libro de las suertes*.

Poetry

The *Poema de Yūḫuf* is a fine example of *cuaderna vía* in Aljamiado from the late thirteenth or early fourteenth centuries; of the same genre and period is *Almadha de alabanza al an-nabī Muḥammad*. Other poetry, though rising to no great literary heights, also celebrates the prophet and the religion of Islam. Only three or four poets are known by name, most of them from the very end of the period: Muḥammad Rabadán (*Discurso de la descendencia de Muḥammad*), Juan Alfonso Aragonés, and Ibrahīm de Bolfad.

It is curious that Aljamiado literature should coincide so precisely in time to the period of literary *maurofilia* in Spain that produced the *romancero morisco* and *El Abencerraje y la hermosa Jarifa*. The romanticized Moor of the latter works could hardly differ more profoundly from the Morisco who was striving to retain his culture in conditions of poverty, persecution, and clandestinity. What the Mudéjares and Moriscos did produce was a literature of preservation rather than of creation, and one closely tied to their feelings of ethnic and religious identity. It speaks in the authentic voice of one of the principal marginalized groups of *marginados* in the history of Spain.

ALJUBARROTA, BATTLE OF

The Battle of Aljubarrota took place on 14 August 1385, and historians continue to regard it as the decisive battle in the political struggle for the kingdom of Portugal. Fernando I of Portugal had designs on the Castilian throne and schemed unsuccessfully to obtain it. He paid for these ambitions by suffering invasions

and heavy military defeats at the hands of Pedro the Cruel's usurping half-brother Enrique II of Trastámara in 1371 and 1372. With thoughts of revenge, Fernando made secret alliance with England. An Anglo-Portuguese force jointly led by King Fernando and the Earl of Cambridge campaigned unsuccessfully (1381–1385) against the armies of Juan I, who had succeeded his father Enrique II on the throne of Castile. The now ailing Fernando ill-advisedly wedded his daughter Beatriz to Juan I by the terms of the ensuing peace treaty, before dying in October 1383. The interregnum that followed his sudden death encouraged the Trastámaran monarch to lay a serious claim to the Portuguese throne through his marriage to Fernando's daughter. He was further encouraged by the fact that the great nobles in Portugal showed little enthusiasm for the exiled illegitimate sons of King Fernando's father, Pedro I, while at the same time strongly supporting the person and policies of King Fernando's widow, Doña Leonor Telles. Despite the popular acclamation of Dom João, Master of the Military Order of Avis as, first regent and then king, Juan I was so encouraged by the confused situation in Portugal that he invaded in 1384. After a series of indecisive engagements he besieged Lisbon but was obliged to raise the siege when plague decimated his army. In August of the following year, tempted again by support among the Portuguese nobility and by his own superior military strength, he invaded a second time. As in the previous year, Juan I planned his main attack from the southeast; but meeting stiff resistance, he marched north to Ciudad Rodrigo and after some hesitation, invaded through the Beira, thus approaching Lisbon from the north. His forces numbered some 22,000 men, outnumbering those of the Master of Avis by more than three to one; and yet he suffered a crushing defeat. Chroniclers attribute the Castilian defeat at Aljubarrota principally to the tactics of the Master's constable, Nun' Alvares Pereira, who counselled strongly that Dom João's army, small though it was, should interpose itself between the advancing Castilians and the capital and fight them in a pitched battle; for, he argued, if Lisbon were lost so would the kingdom be. When the Earl of Cambridge's forces had aided King Fernando in 1381–1382, the Portuguese saw something of the tactics that had given the English the upper hand in France during the Hundred Years' War. The Portuguese constable adopted these tactics: a heavy reliance upon infantry; the deployment of an exceptionally strong contingent of archers; and the tactic of inducing the enemy's cavalry to attack a fixed position carefully chosen beforehand by its defenders. The adoption of the third of these tactics is the reason why the Avis army came to be stationed near the village of Aljubarrota on the morning of 14 August 1385.

Aljubarrota is located at 39.34 north latitude and 8.55 west longitude, twenty-four kilometers southwest of Leiria on the main Coimbra-Lisbon road between the towns of Batalha and Alcobaça. The area is situated on a spur of the Serra de Porto de Mós. The countryside is consequently an undulating one of hills and mountain streams. According to the Castilian chronicler López de Ayala, an eyewitness and participant, the Trastamuran line of attack lay along a stretch of ground between two brooks that effectively narrowed the Castilians' vanguard and made it impossible for the right and left flanks to engage the enemy when the two armies met. Moreover, when the Trastamuran forces attacked the Avis position they were thrown into confusion by the steadiness of the Portuguese pikemen and by the concentrated fire of the mixed force of Portuguese crossbowmen and English longbowmen. Sensing impending defeat, King Juan fled the field in the direction of Santarém while his demoralized army disintegrated soon after.

The battle had several long-term results. It put an end to a civil war in which two candidates for the Portuguese throne had fought for two years; one of them, Juan I of Castile, had by no means the weaker claim, which was supported by many Portuguese magnates, some of whom fought on the Trastamuran side throughout the civil war. The slaughter or exile of these Trastamuran Portuguese produced a social revolution in which an old Portuguese nobility was replaced by a new. The battle put an end to serious Castilian claims to the Portuguese throne, confirmed Portuguese independence, and consolidated the reign of João I as well as the dynasty of the House of Avis. Aljubarrota was to have an enormous symbolic value for later Portuguese romantic nationalism that is illustrated by the enormous Abbey of Batalha that was built to commemorate the victory. Finally, the participation of English archers at Aljubarrota gave impetus to the budding Anglo-Portuguese alliance that would be confirmed in the following year by the Treaty of Windsor.

ALMADA, FELIPA DE

Very little is known about Felipa de Almada, a fifteenth-century Portuguese poet who was a member of the court of João II. The king was a lover of the arts and endeavored to surround himself with talented people. As one of the most important social graces, poetry was cultivated by many members of his court, including some women. Garcia de Resende's *Cancioneiro Geral* (Lisboa, 1516) contains short, cryptic verses by women for men to gloss. In the ongoing court poetry competition, women propounded riddles, and men solved them. The only woman who wrote a lengthy poem, however, was Felipa de Almada.

Rather than propounding a riddle, she solves one by scorning her former lover mercilessly: "What I cannot recover, oh world of uneven order, makes me not wish you well nor desire you harm." All her feelings are gone, and her indifference is total: "I find more pleasure, thus, living in the limbo of your favor, than with the pain of your wretched love."

Interestingly, of all the women poets of the Iberian Peninsula, only Felipa de Almada assumes an unfamiliar role. Constança de Mallorca and Mayor Arias clearly follow the popular tradition of the Galician "*cantigas de amigo*" (songs of love and friendship). Florencia Pinar, another fifteenth-century *cancionero* poet, assumes an active role in the sense that she solves riddles rather than propounding them. However, she presents herself as the suffering party, the victim of love. Where Florencia speaks of her imprisonment and compares herself to a partridge in a cage, Felipa de Almada proclaims her liberation from love. Her poem is almost the reverse of a *cantiga de amigo*, and coming from a Portuguese woman poet could be read as the intertextual game of a writer who refuses to fit into the local mold. Of course, she does so by adopting a different literary role: that of the disdainful lady of courtly love.

ALMANZOR See MANŠŪR, AL-

ALMIZRA (OR ALMIRRA), TREATY OF

Peace agreement signed between Jaime I of Aragón-Catalonia and the future Alfonso X of Castile (in the name of his father Fernando III) on 26 March 1244 at the captured Islamic castle of that name, presently the

Camp de Mirra or El Capet in southern Valencia. The pact did not annul the Cazorla Treaty of 1179 between the two countries, by which respective zones of conquest from the Moors had been finalized. Instead, it worked out discrepancies as to the actual southern border of Valencia, so hotly disputed that war was then imminent between Jaime and Alfonso. After each king had seized towns assigned to the other's conquest, and especially with both claiming Játiva (then under siege by Jaime) Alfonso asked for a meeting.

Jaime's party stayed at Almizra castle and town, Alfonso's in tents at the foot of the hill at Caudete. Stormy arguments nearly aborted this effort at peace until Jaime's Queen Violante and the Master of Santiago intervened. The two kings "amicably" redrew the border, from the confluence of the Júcar and Cabriol Rivers down through Ayora, Almansa, and Biar, out to sea above Aguas de Busot. The 1304 treaty of Torrella later annulled Almizra by moving the border south past Orihuela and Alicante; but the Almizra line remained a civil division interior to Valencia until 1707 and the diocesan border to 1957. King Jaime details the bellicose negotiations in seven chapters of his autobiography, and the treaty itself has often been reprinted.

ALMOHADS

Following the Almoravids, al-Andalus in the second half of the twelfth century was threatened by a new sect that had emerged in North Africa: the Almohads (unifiers, that is, strict believers in the unity of God; in Arabic, *al-Muwahhidin*). Ibn Tūmart, the founder of the sect, objected to the moral laxity of the Berbers of North Africa and declared war against the Almoravid Dynasty, then in control in the Maghrib (North Africa and Muslim Iberia). During these battles he became ill and died (1130). He was succeeded by 'Abd-al-Mu'min, who by 1147 had managed to capture Fez and Marrakesh, the capital of the Almoravids. When Marrakesh was captured, according to one source, the Christian church there was destroyed and a great number of Jews and Christian militia were killed. When 'Abd al-Mu'min conquered Ifrīqiyah (Tunisia) in 1151, he gave the Jews and Christians there the choice of conversion to Islam or death. In 1147 he also sent an expedition to al-Andalus, but the Almohads did not

firmly establish themselves there until 1163. Abū Ya'qūb Yūsuf was the first Almohad caliph to rule al-Andalus (1163–1184), establishing a dynasty that was to last there until 1227. Almohad rule in al-Andalus, however, would prove difficult from the start.

The Almohad condemnation of the popular Māli-kite theological-legal school in North Africa led to rebellion against them throughout southern Morocco and along the coast. Although the rebellion was crushed and thousands, even followers of 'Abd al-Mu'min, were executed, it left the Almohads a legacy of bitter enemies and deep resentments. As a result of a difficult situation in Morocco, Almohad rule in al-Andalus would always be loose and precarious. Given the deep internal divisions in North Africa, the Almohad rulers of al-Andalus, like Ya'qūb I (1184–1199), Yūsuf's successor who had taken the title Al-Manṣūr (the Victorious), were often obliged to rush back and forth from al-Andalus to Morocco in order to protect their interests. In 1195 when Alfonso VIII of Castile attacked

the region of Seville, since it was the nature of the Almohads that only the caliph could lead an expedition to counter a Christian offensive, Ya'qūb, who found himself in Marrakesh, was obliged to hurry to al-Andalus. He met Alfonso's army at Alarcos, dealing Alfonso what would prove the last great Muslim victory over the Christians in Iberia. Ya'qūb pushed his conquest north and was able to take Guadalajara, Salamanca, and other towns. However, he was unable to exploit his success and was called back to Marrakesh to put down yet another revolt.

Like the Almoravids, the Almohads failed in maintaining their influence in Iberia. Religious zeal could not cement a heterogeneous society across a large space. After Ya'qūb's death in 1199, he was succeeded by weak and even incompetent rulers who could not face the all-too-common revolts and dissension that met their brand of fundamentalism. By 1212, the combined forces of Castile, León, Navarre, and Aragón, along with volunteers and mercenaries from other parts

Almohads

of Europe, would deal a crushing defeat at Las Navas de Tolosa to Muḥammad (1199–1213), Ya'qūb's successor. Muḥammad had come to Iberia from Morocco with a large army and the hope of containing the revived territorial ambitions of Alfonso VIII. Barely escaping with his life at Las Navas, Muḥammad was forced to return back across the Straits of Morocco and leave al-Andalus to his adolescent son, Yūsuf II (1213–1223), who would witness the breakdown of Almohad power not only in al-Andalus but finally in the Maghrib as well.

ALMOJARIFE

The term *almojarife* (correctly, in medieval texts or in Portuguese, *almoxarife*) derives from Arabic *wazīr al-mushrif*, which is nevertheless found only in the Mozarabic documents of Toledo, and means, merely, “superintending minister.” In those twelfth- and thirteenth-century documents, this was an official who not only collected taxes but who also served as a judge. However, in general use throughout medieval Spain in all kingdoms it refers to a “tax-farmer,” one who either paid a lump fee for the privilege of collecting taxes or who paid a portion of the allocated taxes to the king in advance and then collected the entire sum, thus making a profit. Usually this post was held by Jews, and every king had several such Jewish *almoxarifes*, beginning at least with Alfonso VIII for Castile and Pedro I in Aragón-Catalonia (though the title in that kingdom was usually *baile*; *almoxarife* is, however, sometimes found).

Such officials were appointed, often for many years, for the taxes of the entire kingdom, but also on a local basis either by the king, the local overlord, and even church officials to administer their taxes. The title of *almoxarife mayor* (chief tax official of the kingdom) ceased to be used at the end of the fourteenth century; only Yuçaf de Ecija (under Alfonso XI), Samuel ha-Levy (Pedro I), and Joseph Pichó (Enrique II) held the title. While Jews continued to function as *almoxarifes* throughout the fifteenth century, the post was increasingly given to Christians.

ALMORAVIDS

The Almoravid (*al-Murābitūn*) Dynasty was founded in North Africa in the early eleventh century. Unlike the later more extreme Almohads, they did not particularly single out Christians and Jews for persecution. However, the Almoravid ruler Yūsuf ibn Tāshfin was invited by the Muslims of al-Andalus to help defend against the invasion of the Castilian king Alfonso VI in 1086. On 23 October of that year, a major battle took place at Zallāqah (Sagrajas, near Badajoz), which turned the tide temporarily against the Christians in their efforts to conquer al-Andalus. Using the opportunity presented them, the Almoravids remained in al-Andalus and took it over from the weaker local rulers, many of whom were forced to flee.

While they were fierce warriors, they were hardly barbarians, as they have sometimes been described. They were often intolerant of philosophical ideas. ‘Alī ibn Yūsuf, who succeeded his father as ruler in 1106, ordered the burning of the works of the mystic philosopher Al-Ghazālī on religious grounds because he disagreed with his views. On the other hand, the Almoravids were not able to eradicate the strong hold of secular studies and literature among the Muslims of al-Andalus, and poetry especially continued to flourish.

While there is a lack of substantial sources, it appears that there was no persecution of Jews either in North Africa or in al-Andalus, at least not in the early years of the dynasty. According to Al-Idrīsī (d. 1162), the Jewish Barghawāta tribe in the region of Marrakesh had a sort of “capital of the South,” the Jewish center of Agmat (Aghmāt). The Almoravids fought the “Judaized” Berbers there in 1059, and their decisive victory marked the decline of the Jewish Berber tribes. In the *Responsa* of Al-Fāsī, a couple of incidents of Muslim officials stealing property from Jews are reported and this was the period of some of the greatest Jewish scholars: Isaac al-Fāsī, Joseph ibn Saddiq, Judah ibn Ghiyāth and his son Isaac, and of such outstanding poets as Moses ibn Ezra and Judah ha-Levy. It is even possible that one of the poets wrote a poem commemorating the victory of the Almoravid armies against the Christian attacks in Lucena.

The oft-discussed “market regulations” (a manual of laws written by a Muslim judge responsible for the market) of Seville are somewhat misleading as a true indicator of relations between Jews and the Almoravid rulers, or certainly the Muslim population, at the time. According to those largely theoretical laws, Muslims could not massage Christians or Jews in the public baths, nor should a Muslim take care of an animal

owned by a Jew or Christian. Jews were not allowed to slaughter meat for Muslims, although in fact we know they did. The clothing of lepers, libertines (sexually promiscuous people), Jews, or Christians could not be sold without indicating their origin. Christians and Jews were not to dress in the clothing of people of position nor greeted with the customary formula "peace be upon you," for "the devil has gained mastery over them and has made them forget the remembrance of God. They are the devil's party, and indeed the devil's party are the losers." Both Jews and Christians were to wear distinguishing insignia.

In fact, Jews and Muslims, including the rulers, were increasingly on good terms with each other in al-Andalus. It is thus hard to reconcile the statement of the great scholar, biblical commentator, and poet Abraham ibn Ezra that he was forced to flee Spain because of the "oppressors," when we have no evidence of any oppression. Indeed, it is possible that this statement refers to the Almohad invasion of 1145, although the Almohads were not firmly established in al-Andalus until at least 1163.

We hear of some isolated instances of Jews who converted to Islam during the Almoravid period in al-Andalus, but these were voluntary conversions. There are few studies of the Almoravid period in general.

ALVARES PEREIRA, NUN'

Son of Alvaro Gonçalves Pereira, Prior of the Hospitallers, and Iria Gonçalves do Carvalhal, born in Portugal, most probably at Sernache do Bonjardim, or Flor da Rosa in the Alentejo, in 1360. His life has become legend, and it is difficult to separate fact from fiction as the mythmaking process started in his own lifetime. Trained as a knight, he was a deeply religious man who lived up to the ideals of chivalry, inspired by the adventures of King Arthur and the Knights of the Round Table. In compliance with his father's wishes, he married Doña Leonor Alvim, a wealthy widow from northern Portugal, becoming a powerful landowner. He began to show his independence of character and his hatred of Castilian intervention in Portuguese affairs at the time of Fernando I's reign (1365–1383).

During the crisis of the dynastic succession (1383–1385), he gave his support to Dom João, Master of Avis, distinguishing himself as a charismatic leader and a brilliant strategist. By fighting a war of movement at a time when laying siege to a town was the general rule, he changed the fortunes of war. The combined action of the infantry and bowmen proved an unbeatable match to cavalry charges. In this way were won in quick succession the battles that established firmly Portuguese independence. Nun' Alvares Pereira was made constable or chief general of the Portuguese armies, and granted large donations of land by João I. There was a serious friction between the two men, when Nun' Alvares distributed this property among officers who had served him well in the war. In 1423, he withdrew from the world, taking the Carmelite habit in the church of Carmo, which he had founded in Lisbon in 1389. Admired as a shining example of patriotism, he died in odor of sanctity in 1431 and was beatified by the Roman Catholic Church in 1918.

ALVAREZ DE VILLASANDINO, ALFONSO

A Castilian poet active from the early 1360s well into the reign of Juan II. Alfonso Alvarez de Villasandino was of petty noble birth, and therefore felt entitled to call himself *trovador*, poet for honor. But as his fortunes declined, he took on the character of a *juglar*, poet for pay. First and last, he was a man of the court: his writings testify that he was in royal company from the time of Enrique II to the early years of the majority of Juan. His production is large and varied. In the early Trastámara years he wrote in Galician, largely *cantigas de amor* love poems not greatly different from those of Macias or of the archdeacon of Toro. In later years he abandoned Galician for Castilian, composing along the way poems in a hybrid language, with elements of both. The themes, genres, and style of his production also changed. He continued to write both amorous and devout songs, though the former tended to be more elaborate and varied than his Gallego pieces. His later work is subtler in theme and more complicated in form. And song no longer monopolized his work. There appear *dezires* (narrative poems) of all sorts—allegorical, occasional, religious, and poems of petition, the last of which rank among his wittiest and most delightful. The changes that overtake Villasandino's produc-

tion over time deserve special comment. The older manuals describe him globally as a member of the Gallico-Provençal school. The term is misleading. It fits perfectly the early Villasandino, the poet in Galician: at least one body of poetry in Galician or Portuguese is based generally on a set of rules and conventions inherited from those of Provençal song. Villasandino's later work is a response to social changes and to new currents in taste, but most importantly, it is a reflection of a second wave of Provençal influence in Castilian poetry, this time coming from the teachings of the Consistory of the Gay Science in Toulouse. The immediate source of the doctrine is almost certainly the copies or avatars of that institution, which existed in Barcelona and Valencia in his day. The formal complexity of his later verse, the elaborate metrical schemes, and the difficult rhyming patterns undoubtedly owe their existence to this neo-Provençal strain.

ALVAREZ GATO, JUAN

Converso (Christian convert) poet born in Madrid ca. 1440. He served at the court of Enrique IV under the patronage of Beltrán de la Cueva. Later Alvarez Gato entered the service of two powerful Castilian converso families, the Arias Dávila and the Mendozas of Guadalajara. Toward the end of his career at court, he became the majordomo of Queen Isabel I. Alvarez Gato was close friends with Fray Hernando de Talavera, the queen's confessor and archbishop of Granada, with whom he shared a contemplative religious sensibility marked by a sense of doctrinal tolerance. Alvarez Gato died between 1510 and 1512.

Alvarez Gato's poetry is generally seen as developing in two periods: the first, dominated by profane, amorous verse characterized by hyperbolic religious metaphors and comparisons; and the second, whose tenor is religious and moral, marked by a deep spirituality that leads Alvarez Gato to appropriate and endow popular literary motifs with a religious sense (a style referred to as *a lo divino*).

ALVARO, PELAYO

Alvaro Pelayo (Alvaro Pais) (d. 1353), a Portuguese Franciscan, after taking his doctorate in canon law at the University of Bologna and serving in the papal curia, was elevated to the bishopric of Silves in the Algarve in 1333. Conflict over ecclesiastical rights with Afonso IV of Portugal forced him to withdraw to Seville in 1349, where he later died.

A vigorous author, his principal work is the *De planctu ecclesiae*, written about 1330 at the request of Pope John XXII, as a defense of the absolute authority of the pope and a counterattack on Marsiglio of Padua, author of the *Defensor pacis*, and other champions of secular power. In order to achieve its spiritual purpose of leading all men to salvation, the church, in Alvaro's judgment, had need of a complex hierarchical structure, laws, and property. The pope, as the vicar of Christ, was godlike (*quasi Deus*) in the power and authority that he exercised subject to the constraints of no individual or institution. Endowed with a plenitude of power that included the temporal realm, the pope sanctioned and justified secular rulership. The Holy Roman Emperor was a papal delegate to whom other kings (excepting "the kings of Spain . . . because they have ripped their kingdoms out of the jaws of the enemy") were subordinated. While Alvaro effectively synthesized old arguments, the ideas that he espoused were coming under increasing challenge from royalist lawyers and even from canonists and theologians who believed that papal authority had been carried to extremes.

Besides his defense of the papal theocracy, Alvaro lamented the abuses that he perceived in all ranks in the church and in Christian society. Those who came under his lash included members of the papal curia; usurers; concubinary clerics; friars guilty of pride, idleness, incontinence, and ambition; and papal inquisitors who condemned victims in order to seize their money for themselves. Peasants, too, were a sinful lot who were unfaithful to their marriage vows and kept themselves from their wives so as not to have children they could not support. Although they attended church, they only entered during the elevation of the mass in order to see the Body of Christ, but not to receive it.

Alvaro also refuted various heresies in his *Collyrium fidei contra hereses*. His *Speculum regum*, a mirror for princes written between 1341 and 1344, was dedicated to Alfonso XI of Castile, whom he exhorted to defend the faith against the infidels, to expel the Moors from Spain, and to conquer Africa, because it pertained to the inheritance of the Visigothic kings. Ever the moralist, he castigated kings for failing to seek the counsel of their subjects, for manipulating the coinage to the detriment of the people, and for their

oppression of the church. He argued that it was best to leave a tyrannical king to divine judgment, rather than bring about greater evil by seeking to dethrone him.

ALVARUS, PAULUS

Córdoba laymen, author; mid-ninth century. Very little is known about his life. A reference in one of his letters hints at Jewish ancestry; another suggests Gothic blood. Either or both could, however, have been intended metaphorically given their contexts. His family owned enough land to allow them to use part of it to endow a monastery. Alvarus studied under Abbot Speraindeo at the church of St. Zoylus in Córdoba, where he met and befriended Eulogius. There, among other things, the two developed an interest in poetry, which Alvarus would pursue later in life, composing a number of poems that have survived. The preface to his *Vita Eulogii* suggests that Alvarus did not follow his friend into the priesthood. He appears to have married and to have lost three of his daughters, though the circumstances are unknown.

Letters to and from a variety of correspondents constitute the bulk of his extant writing. The earliest of these are the four directed to Bodo, a deacon in the Carolingian court who converted to Judaism, adopted the name Eleazar, and moved to Spain. Alvarus's letters to Bodo-Eleazar predictably attempt to prove that Jesus was the Messiah. Three responses survive, though in fragmentary form. Alvarus also wrote to his former teacher Speraindeo asking him to respond to an outbreak of some unnamed heresy. Alvarus directed another four letters to his friend (and perhaps brother-in-law) John of Seville, another layman, in which he explored the role of rhetoric in Christian education and delved into Christology.

Alvarus's role in the Córdoba Martyrs' Movement of the 850s was an auxiliary one. From his cell in the autumn of 851, Eulogius sent drafts of the *Memoriale sanctorum* and the *Documentum martyriale* to Alvarus for his comments. The letters that Alvarus wrote in response were subsequently appended to the treatises. We know from Eulogius that Alvarus advised at least one of the would-be martyrs who sought him out for advice. In 854 Alvarus wrote his *Indiculus luminosus*, the first half of which is a defense of the martyrs, and the second half a novel attempt to portray Muḥam-

mad as a precursor of Antichrist by interpreting passages from Daniel, Job, and the Apocalypse in light of Alvarus's knowledge of Islam. Toward the end of the treatise, which seems not to have been completed, is the frequently quoted passage lamenting the fact that Christian youths of the day were more interested in studying Arabic than Latin literature. Finally, sometime after Eulogius's execution in 859, Alvarus wrote the *Vita Eulogii*.

The last of Alvarus's letters indicate that he had suffered from a serious illness and had received penance in anticipation of his death, only to recover. He solicited Bishop Saul of Córdoba to release him from his penitential obligation to refrain from participation in communion, a request that was denied. Alvarus's *Confessio*, a lengthy formal prayer for forgiveness of sins, probably also dates from this period. The fact that he is not mentioned in Samson's *Apologeticus* (864) and that Alvarus never referred to the controversies that elicited its composition suggests that he died in the early 860s.

AMADÍS DE GAULA

Amadís de Gaula is the Spanish book of chivalry par excellence. Historically, it is most likely the first among the Hispanic chivalric stories related to the *matière de Bretagne*. The plot is set in a time before Arthur's reign, since Arthur's world, after the discovery of the Grail, signified the apocalypse of chivalric adventures and of chivalry itself. It is impossible to summarize the number of interlaced plots and subplots that constitute the chivalric fable, *Amadís*, a veritable *roman fleuve* (river of romance). The main plot is based on what may be called the chivalric fable, which can be summarized as follows: the hero is removed by Providence from his royal family and heritage so that he can prove his virtue as a knight, win wealth, fame, and estate, and then recuperate his royal origins. Only after the hero has earned the latter are his origins revealed to him, and his royalty is publicly acknowledged. *Amadís* tells of Amadís's ancestry, birth, education, love, and adventures. He is the secret love child of King Perión and Princess Elisena. After his birth, he is set adrift in a basket (à la Moses) and rescued by a knight, Gandales, who educates him along with his own son, Gandalín. Amadís is introduced to King

Lisuarte of Britain and falls in love with Oriana, Lisuarte's daughter. Amadís dedicates his exploits and existence to Oriana, seeking to conquer her heart as well as la Ínsola Firme, a kingdom he wishes to vanquish and rule. Amadís's and Oriana's clandestine marriage in turn gives rise to a new plot based on the pattern of the chivalric fable. Oriana gives birth to their son, Esplandián, who is kidnapped by a lioness and then educated by Nacién the Hermit. Esplandián's destiny is to master the Empire of Constantinople. The romance narrates many more stories, all neatly interlaced through the use of rhetorical devices used in historiography and in Arthurian prose all over Europe. *Amadís de Gaula* is a microcosm of all the chivalric subjects that will be developed later in the sixteenth-century Spanish romances of chivalry.

The origins of *Amadís* remain uncertain. The only extant complete versions of the romance, all from the sixteenth century, differ from one another and ultimately prove reprints and transformations of the work, as it was originally planned and rewritten in four books by Garci Rodríguez de Montalvo at the beginning of the sixteenth century. There was in all likelihood an incunabulum first edition of *Amadís* that is now lost, probably printed in 1496. The first extant edition is the one published at Zaragoza by Jorge Coci in 1508. Printed editions notwithstanding, *Amadís de Gaula* had a long existence before its appearance in print. Antonio Rodríguez Moñino brought to light some manuscript fragments from a primitive *Amadís*, probably conceived in three books, in which Esplandián had already appeared. In these, Amadís was killed by his brother, Galaor, and Oriana committed suicide. Evidence indicates that tales and stories about Amadís were very popular from the middle of the fourteenth century on. Avalor Arce has speculated that the first Amadís story appeared circa 1290. Research by Cacho Blecua, however, shows that the first version of the story was probably composed during the reign of Alfonso XI, around 1330–1340.

One of the most interesting yet least studied features of the extant *Amadís* is the ideological tension that underlies the notions of chivalry, monarchy, and the discourses of power that accrued in the work during the century and a half of its circulation prior to finally appearing in print. Despite Garci Rodríguez de Montalvo's best efforts, he was unable to erase this tension, even as he tried to produce a text whose ethical and political principles reflected his own contemporary values.

‘ĀMIRIDS See MANŞŪR, AL-

ANAGNI, TREATY OF

In 1295 a further attempt, with papal mediation, was made to put to an end the War of the Sicilian Vespers, which had been disrupting Italy and the Mediterranean since 1282. Pope Boniface VIII sought to strike an agreement that would strengthen his relations with King Charles II of Naples, for whom he had no great liking (Charles having been the principal support of his unhappy predecessor Celestine V), but whose influence in the Guelph factions throughout Italy made him an essential ally. Charles in the early months of 1295 showed his friendly disposition to the pope by investing Roffredo Caetani, Boniface's brother, with important estates in southern Italy. King Jaime II of Aragón also made attempts not to antagonize a pope who had already proved himself a figure not to be trifled with; he accepted Boniface's demand that he should avoid entering into marriage ties with France, which might lead to the creation of a Franco-Angevin access isolating the papacy. He was also keen to arrange the release of his sons, who were hostages in Aragónese hands. The French stabilized the situation further by renouncing all recent claims to the crown of Aragón. A third key figure was Jaime's lieutenant in Sicily, his younger brother Fadrique, who, although excommunicate, sought a meeting with the pope; Boniface was in a conciliatory enough mood to receive him away from public gaze, and to promise him the hand of Catherine de Courtenay, heiress to the Latin empire of Constantinople, in return for his abandonment of Sicily. Thus the stage was set for an agreement at Anagni, to be cemented by massive grants: a dowry of 75,000 marks when Bianca of Naples would marry Jaime II of Aragón; 6,000 florins for Jaime as the reward for an early cession of Sicily to the house of Anjou. The king of Aragón was, however, urged to recognize the rights of his uncle and namesake, Jaime II of Mallorca, in the lands from which the Aragónese had dislodged the Mallorcan king. Agreement was reached in stages during June 1295, and the treaty has been described as Boniface's first great diplomatic triumph. The problem that proved impossible to resolve was the cession of Sicily, because Fadrique of Aragón now emerged as the champion of Sicilian independence from the house of Anjou, with the backing of the Sicilian nobles and without the distraction of marrying Catherine de Cour-

tenay (who is said to have argued that a princess without lands should not marry a prince without lands). The treaty resulted therefore in a breach between Fadrique and Jaime II of Aragón, and in new initiatives (including the grant of Sardinia to Jaime in lieu of Sicily).

ANCHIETA, JUAN DE

Spanish composer, born Urrestilla or Azpeitia, Guipúzcoa, 1462; died Azpeitia, 30 July 1523. His mother, Urtayzaga, was a close relative of the founder of the Society of Jesus. Queen Isabel on 6 February 1489 appointed him a singing chaplain in her court, which moved constantly (fifteen times between 1491 and 1503), and on 30 August 1493 raised his yearly salary to 30,000 maravedis. In 1495 he became *maestro de capilla* (music director) in the newly erected household of the crown prince, seventeen-year-old Don Juan (1478–1497). As such he frequently joined the music-loving prince and other selected youths in afternoons spent singing.

Queen Isabel died 26 November 1504, but Anchieta remained in her daughter Doña Juana's household. With such other court singers as Pierre de la Rue, Alexander Agricola, and Marbriano de Orto, he visited Flanders and from January to April 1506 was in southern England during the return voyage to Spain. After Felipe the Fair's death he remained Doña Juana's chaplain, at 45,000 maravedis salary. At age fifty-seven he was pensioned on 15 August 1519 by Charles V, who declared him too old to reside at court but allowed his high salary to continue to be paid until Fernando's death, while Anchieta resided wherever he pleased. From 1500 to 1523 he was Rector of San Sebastián de Soreasu parish church in Azpeitia. He made a will, signed 19 February 1522 (codicil 26 July 1523) that itemizes rich holdings divided among blood-related heirs. From 1518 he also enjoyed large revenues from the abbacy of Arbas.

His earliest surviving work is the romance, *En memoria d'Alixandre*, composed in the summer of 1489. His *Missa ea iudios a enfardelar*, written in 1492, is lost, but in 1577 Francisco de Salinas quoted the popular song on which it was based. His villancico *Dos anades madre* continued being frequently sung as late as 1626, according to Francisco de Quevedo. Miguel de Cervantes mentioned the same work in *La ilus-*

tre fregona (1614). In total, Anchieta's extant works include two masses for four voices (De Beata Virgine, Kyrie, Gloria, and Credo movements), *Quarti toni* (partially based on the ubiquitous *L'homme arme* song); two Magnificats; five motets; first verse —derum, for three voices; Libera me of the hymn *Conditor alme* responsory and *Salve Regina* antiphon. His Latin works, although not scholarly, are always sonorous and graceful. His four charming songs with Spanish text are found at nos. 231, 404, 177, and 130 (*Con amores*, *Donsella*, *Dos anades*, *En memoria*) in the Palace Songbook (Madrid: Biblioteca del Palacio Real, MS 1335, formerly 2–I–5).

ANIMAL FABLES

St. Isidore explains that the behavior and speech of irrational animals in fables illustrate human behavior (*Etymologies* 1.40). Fables are narrative units customarily independent of moralization; they are heuristic, teaching by example, although in written versions promythia and epimythia are sometimes added. In discourse, fables, or allusions to them, usually explain or reinforce a statement of a cultural norm.

In remote times in India, Egypt, Syria, and in the Far East, the use of animals in illustrative tales is traceable to a belief in metempsychosis (See "The Rat Maiden," *Calila e Dimna* 4, motif B601.3). Animal tales told to illustrate an advice to princes form the five books of the Indian *Panchatantra* (third century of the Christian era). Ibn al-Muqaffa's eighth-century translation circulated widely in the Islamic world. In written form these tales came to the west through translation ordered in the thirteenth century by Alfonso X in *Calila e Dimna*.

In the Western tradition, a body of animal fables had accumulated around the figure of the fabulist Aesop. The first published collection by Demetrius of Phalerum (345–283 B.C.) has not survived. First-century A.D. collections available are: Latin verse by Phaedrus and slightly later Greek verse by Babrius. Avianus

(late fourth–early fifth centuries) wrote forty-two fables in elegiac verse based on Babrius, and the various *Romulus* collections circulating in the Middle Ages relied on Phaedrus. (See *Ysopete ystoriado* for fifteenth-century Spanish translations.) Aesopic fables are the persuasive tools of the *Arcipreste*, *Don Amor*, *Trotaconventos*, and the various *dueñas* in the fourteenth-century *Libro de buen amor*. In the *Conde Lucanor*, out of a total of fifty-one exemplary tales, Patronio uses eleven animal fables, some drawn from Aesop and others from oriental sources, to counsel his master.

Allusions to animal fables in circulation in the oral tradition found their way into sermons. In the twelfth century, Petrus Alphonsi had alluded to three fables associated with the Arabic fabulist Loqman and included four others in the *Disciplina Clericalis*. The *Fabulae* or *Narratione* of Odo of Cheriton (thirteenth century) was the source of the fifteenth-century *Libro de los gatos*. However, a collection of over four hundred sermonic *exempla* includes only eighteen animal fables (see Clemente Sánchez de Vercial, *Libro de los exenplos por a.b.c.*).

ANTÓNIO OF LISBON, SAINT

Fernando Martins, born in Lisbon ca. 1189, became known under the name of St. António of Lisbon. He attended the school of the Cathedral of Lisbon as acolyte and took religious vows at St. Vincent's Monastery of regular canons (ca. 1209). From there he moved to the Monastery of Santa Cruz of Coimbra (ca. 1212) where he completed his intellectual background studying patristic literature, later revealed in his sermons. He was ordained presbyter (ca. 1218) when a small group of Franciscans arrived in Coimbra and shortly after departed to Morocco, where they were martyred. When their relics were taken back to Coimbra (1220), Fernando became a Franciscan friar and adopted the name of António. He wished to follow the martyrs' steps and went to Morocco, but he eventually settled down in Italy where he lived for some time with hermit friars. In 1222, having preached during the ordainment of several friars, he achieved so great success that he was asked to give new sermons in places influenced by the Catharist and Albigensian

heresies. He continued intensively with this activity in the north of Italy (1222–1224) and the south of France (1224–1227). He became master of the first Franciscan schools of theology in Bologna (1223), Montpellier (1223), and Toulouse (1225), and ran the Convent of Limoges (1226). The general minister João Parente appointed him visitor to the northern Italy convents (1227–1230) and itinerant preacher. Padova became the center of his preaching activity, and it was there that he wrote his *Sermones dominicales* and *Sermones festivales*. St. António mediated as peacemaker during the dissensions among the Franciscans and during the attacks led by the neighbor cities against Padova. He died on 13 June 1231 and was canonized on 30 May 1232.

ANTIFEMINIST LITERATURE

With Lilith the evil succubus, and Eve the eternal temptress as models, medieval antifeminist literature portrayed woman as an inducement to sin. She was “confusión del ome e bestia syn fartura” (*Espéculo de los legos* 62). An ancient Aesopic tale compared the adulterous woman's insatiability to the hen's perpetual scratching for seed despite a barn full of grain (*Ysopete ystoriado*, motif J1908.4). Women dominated and destroyed great men: David, Aristotle, Vergil (*Libro de buen amor*, *Arcipreste de Talavera*).

Folktales about female adultery made their way into literature in translations from the Arabic in thirteenth-century Spain (*Libro de los engaños y assayamientos de las mugeres*; *Calila e Dimna*). Some had appeared earlier in the twelfth-century *Disciplina Clericalis* (motifs K1510 through K1544), and were subsequently recounted in the fifteenth century in the *Libro de los exemplos por a.b.c.*, *Ysopete ystoriado* (1488), and *Arcipreste de Talavera* (1438).

The audience for which antifeminist works were written is significant. Sermons and treatises intended to encourage and reinforce chastity or clerical celibacy were often explicitly antifeminist. The burned corpse of a woman hanging in a tree elicited the remark: “Oxalá llevasen todos los árboles tal fructo” (*Historia de Segundo*).

However many sexual *exempla* about adultery in these treatises might have been told originally to mock their male protagonists rather than to attack women.

That humor inhered to the topic is evidenced by the seriocomic *Arcipreste de Talavera*, a work directed to both a clerical and a courtly audience. Alfonso Martínez de Toledo calls women avaricious, covetous, envious, inconstant, two-faced, disobedient, overproud, untruthful, garrulous, gossipy, and given to excessive drinking. His jocular retraction expressing mock fear of female retribution puts the lie to his serious intentions. Similarly, Pere Toroellas's vituperative *Maldezir de mujeres* (1440) ends with a graceful palinode: "Vos sois la que deshacéis lo que contienen mis versos." On the other hand, in Luis de Lucena's *Repetición de amores* (1497) the author takes seriously his censure of women and of worldly love. Not so in *Celestina*, where the servant Sempronio delivers a less-than-sincere vehement antifeminist speech as a ploy to deflate Calisto's courtly posturings about love.

ANTIPHONER OF LEÓN

The León Antiphoner is the most important document of Spanish music produced before the Reconquest of Toledo in 1085. A facsimile of the original manuscript was issued at Madrid in 1953. The manuscript, which reaches 306 folios, contains music over every page except those in the preface and calendar. The musical tradition of the León Antiphoner may be as old as King Wamba (662); Wamba's antiphoner is cited in the León (fol. 25^{vb}) as its model. The main body was written circa 950, if the dedication to Abbat Ikilanus (917–960) is to be taken seriously. A miniature on the back of the first folio shows a scribe handing the completed antiphoner to the dedicatee. The manuscript contains eighteen other miniatures, that (at fol. 217^v) of royal consecration being one of the earliest of its class known. The preface, which includes 130 lines of inflated Latin poetry, bears a much later date: 1069.

This prefatory poem, like many of the chants in the León Antiphoner, is ascribed to a definite author: in this case Eugenius III of Toledo. According to our poet, no single individual endowed the Spanish Church with its numerous beautiful chants. On the contrary, many holy men inspired by God made up its dowry. Eugenius's poem notes that "In that former age many individuals, enjoying a common inspiration, composed

chants in honor of the Almighty." The poet's testimony is confirmed by evidence scattered in the margins throughout the main body of the León Antiphoner. Marginal ascriptions mention such pre-Conquest fathers as Isidore, Ildephonsus, Julian of Toledo, Rogatus of Baeza, and Balduigius of Ercávica. The case for their authenticity is strengthened by the fact that the same scribe who jotted the ascriptions copied both text and neumes. However, several of the *plurimis sacris virorum* to whom chants in the León Antiphoner are ascribed were obscure persons, even by Spanish standards.

With his eye ever on the past, our Antiphoner poet complains not only that the threefold division of the choir has died out, but—worse still—that the whole body of singers *connexi nunc psallant exules a doctrina* (now stand together when singing praises, departing from right tradition). But he hopes for the return of better days, when singers who carefully meditate on every word they sing will win back many wandering minds from vain things.

Throughout the main body of the León Antiphoner such performance directions as the following appear: *Dicentes voces praeconias* (fol. 133); *Imponit arcidiaconus voce clara hanc antiphonam* (fol. 153^v); *Imponit episcopus hanc antiphonam subtili voce decantando: Ecce venit hora ut dispergamini* (fol. 164^v); *Imponit episcopus voce tremula* (fol. 166^v). In the first rubric, the deacons giving instruction to an assembly of catechumens (not those to be confirmed, since confirmation in the Mozarabic rite was administered immediately after baptism, and by a priest, not a bishop) are required to sing in a loud town-crier's voice. In the second, the archdeacon is advised to sing a Palm Sunday antiphon in a clear voice. In the third, the bishop chants an antiphon with words from the Passion narrative—"Behold the hour cometh, yea is now come, that ye shall be scattered, every man to his own, and shall leave me alone" (John xvi. 32)—is enjoined to sing this particular text *sotto voce*, doubtless for dramatic effect. In the fourth, the bishop who sings *Populae meus* ("O my people, what have I done unto thee? and wherein have I wearied thee" [Micah vi. 3]) is directed to begin the *Improperia* with a tremolo in his voice—again, surely with deliberate dramatic intent.

Fortunately, the León Antiphoner is preserved in its entirety. Beginning with 17 November, the first day in the Mozarabic church year (St. Acisclus's Day), it carries through without interruption to the following 17 November, providing certain additional chants at the end for the dedication of a basilica, consecrations of bishops and kings, marriages, the ministry to the sick, and committals. Because it is not mutilated after the fashion of other Mozarabic monuments the liturgi-

ologist can go through it, making a comparative study of “forms” in Mozarabic music. Such a study is the more necessary because certain Mozarabic chant types are uniquely Spanish while others, if not uniquely so, bear names that can cause confusion. For instance, *prolegendum* = introit; *psallendum* = gradual; *laudes* = alleluia; *sacrificium* = offertory; *trenos* = tract. The two uniquely Spanish chant types would seem to be the *preces* and the *sono*. But *sono*, like *selah* in the Hebrew psalms, is a term still too imperfectly understood to permit secure definition.

The León Antiphoner not only contains chants for the entire church year but (unlike modern antiphonaries) for the office as well as mass. Such ramifications of any chant type as the following can therefore be studied: (1) comparative position in the Hours and in the Sacrifice; (2) choice of text—different or the same in the Office and Mass; (3) syllabic versus melismatic treatments of the text; (4) formal structure of the melodies; (5) use of borrowed musical material.

The *laudes* are the one chant type that has been most exhaustively studied with just such criteria as the above in mind. As for their place in the eucharist laudes climactically closed the Mass of the Catechumens. They provided a musical coda to the homily expounding the Gospel for the Day. But if their position made of them an *Ite missa est* closing the Mass of the Catechumens, they also served as a transition into the Mass of the Faithful.

Though the word *alleluia* came after the scriptural verse in Office laudes it preceded the verse in Mass laudes. What is more, the scriptural texts of the Mass laudes—though still of a laudatory type—were not invariably chosen from Psalms 148 or 150, or even for that matter from any psalm. The jubilus in the alleluia, to make a further contrast with the Office laudes, came always on the last syllable, the *a*. In sixty-eight of the seventy-six Mass laudes, the luxuriant melisma on the final *a* in *alleluia* was again repeated on the final (or penultimate) syllable of the scriptural verse that follows the alleluia.

Mass laudes, outside Lent, can be grouped according to several well-defined musical types. One of these, the *Ecce servus* type of laudes melody, appears in masses honoring masculine saints: Andrew, Eugenius, Cucufatus (Cugat), Cyprian, Cosmas, and Damian. Another, the *Lauda filia* type, appears in masses honoring feminine saints: Eulalia, Justa, and Rufina. A third type, the *Lauda Hierusalem*, is again dedicated to masculine saints; John the Baptist, Columba, Emilianus. (Twenty-four laudes melodies cannot, however, be classified under types.)

If in the Visigothic liturgy the word *alleluia* dominates the Mass as well as Office laudes it appears even

more frequently elsewhere in the liturgy as an interjection. A study of its use shows that the single word *alleluia* was considered equally appropriate in an Office for the Dead and in an Easter Mass. The alleluia outside laudes was always melodically treated. Occasionally it stretched to spectacular lengths. Vocalisms in the León Antiphoner reaching such an extravagant number of notes as three-hundred are by no means rare. On the very first page of the facsimile (fol. 29) such a melisma can be seen. The scribe copied it in the outer margin, beginning the neumes at the bottom of the page and carrying them up to the top. In the first hundred leaves the margins of thirty-four pages have been so used.

Obviously neumes that can be written from bottom to top of a page lack any heightened implications; but patterns of neumes occur. In the marginal *alleluia* copied (at folio 60) the following musical structure can be easily enough detected: AA', BB', CC', D (the vocalism appears here over the second syllable of the word). This same melody recurs elsewhere in the Antiphoner fitted syllabically to a text beginning *Sublimius diebus*. The melisma that served as a model for the sequence *Sublimius diebus* (fol. 1^v of the León Antiphoner) forms part of the “Sono” of the office *Ad matutinum* found at folio 60. Because long melismas of the AA', BB', CC', DD' type so frequently occur, it is not surprising to find that repeat signs were sometimes used to lighten the labor of copying. In the León Antiphoner a stylized letter *d* looking like a backward 6 with the ascender crossed (abbreviating *denuo* or *dupliciter*) is used 128 times as a repeat sign. The sequence was therefore an established form in Spain a century before Notker Balbulus.

APOLLONIUS OF TYRE See LIBRO DE APOLONIO

ARABIC LANGUAGE

The Muslim invasion of 711 had two broad linguistic consequences for the Ibero-Romance languages. First, it brought the Romance dialects of Hispania in contact with Arabic, thus creating an environment for substantial lexical borrowing and occasional morphological borrowing. Second, the dialectal map of Iberia was radically changed and importance was given to varieties of Romance that otherwise might have remained insignificant.

Against von Wartburg's claim that the Moors were responsible *per negationem* for the national and linguistic domains of Portuguese, Castilian, and Catalan, contemporary scholarship no longer sees the invaders and their language as passive onlookers to the development of the Ibero-Romance languages. Between 711 and 718 the Moors established control over approximately three-fourths of the Iberian Peninsula but allowed the survival of Christian enclaves in the north and northwest. The geographical unevenness of the Muslim presence on the peninsula is reflected today in the much weaker influence of Arabic on Galician and Eastern and Northern (French) Catalan than on Castilian, Portuguese, and Western Catalan.

Sociolinguistic tensions ran high among educated speakers of Arabic and Romance, with each side blaming the coexistence of languages for an erosion of native language abilities. Hillenbrand (Jayussi) cites Alvarus, bishop of Córdoba, who in 850 remarked of his coreligionists, "... hardly one can write a passable Latin letter to a friend, but innumerable are those who can express themselves in Arabic and can compose poetry in that language with greater ease than the Arabs themselves." As Harvey reports, toward the end of the cohabitation period, the fifteenth-century *muftī* (senior clerical exegete of the Qu'rān and the *sharī'a*) al-Wan-sharīshī lamented the loss of distinctive features of Muslim life as a consequence of bilingualism: "One has to be aware of the pervasive effect of their way of life, their language ... as has occurred in the case of the inhabitants of Ávila and other places, for they have lost their Arabic, and when the Arabic language dies out, so does devotion in it, and there is consequential neglect of worship as expressed in world. ..." Thus there is significant anxiety on both sides not just about losing language, but also about the inevitable loss of culture in a prolonged situation of bilingualism.

Across the north-central part of the peninsula, the Christian Reconquest seems to have had a devastating effect on the Arabic-speaking Muslim communities; little evidence is available to make strong conclusions

about the status of Arabic in the everyday life of those areas. Yet in al-Andalus, the Arab-controlled southern portion of the peninsula, there is abundant evidence of more self-confident and self-assertive Muslim communities. It was to Valencia, for example, that Aragónese Muslims sent their young men who needed to be trained in Arabic. And though in the Arabic side to Mudéjar, where bilingual Muslims lived under Christian rule, Valencian historical documentation is sparse and suffused by the Romance speech of the incoming conquerors, there was no sign until the early fifteenth century that Arabic was in real danger of being replaced by Castilian there or in Naşrid Granada (i.e., the line of kings, 1232–1492, descended from Yūsuf ibn Naşr).

The multilingual nature of al-Andalus cannot by itself explain the host of Arabisms taken into Ibero-Romance, since the forms of Romance spoken bilingually with Arabic in Islamic Iberia (e.g., the Mozarabic dialects of Spain) were not forms of Portuguese, Castilian, or Catalan, but rather independent descendants of spoken Latin that became extinct in the later Middle Ages. Two important factors that motivated the substantial borrowing of Arabic words across Ibero-Romance are the need for names applicable to new concepts that reached north from al-Andalus and the high cultural prestige associated with Arabic in the early Middle Ages.

A very high percentage of Arabisms in Ibero-Romance are nouns. Lapesa's enthusiastic count of some four thousand Arabisms in Castilian has been reduced to around nine hundred (with derived forms accounting for the apparent total of four thousand. A comparable number is cited for Portuguese; Machado claims exactly 954 Arabisms. For Catalan, Badia and Moll give estimates of around two hundred borrowings. In his book-length study of four hundred Arabisms in Ibero-Romance and Italian, Kielser (1994) found eighty direct borrowings common to Portuguese, Castilian, and Catalan. The following semantic fields show examples of particularly frequent borrowings across Ibero-Romance: (1) plant life: in Portuguese, *albricoque*; in Castilian, *albaricoque*; in Catalan, *albercoc* (all meaning apricot); *alfarroba*; in Castilian, *algarroba*; in Catalan, *garrofa* (all meaning carob bean); in Portuguese *limão*; in Castilian, *limón*; in Catalan, *llimona* (all meaning lemon); (2) food preparations and seasonings: in Portuguese and Castilian, *escabeche* (meaning pickling brine); in Catalan, *escabetx* (meaning vinegar and oil sauce); in Portuguese and Catalan, *alcaravia* (more commonly in Catalan, *comi*); in Castilian, *alcaravea* (meaning caraway seeds); in Portuguese, *açúcar*; in Castilian, *azúcar*; in Catalan, *sucre* (all meaning sugar); (3) agriculture: in Portu-

guese, *alcaria*; Castilian, *alquería*; in Catalan, *alqueria* (all meaning farmstead); in Portuguese, *adua* (meaning common irrigation water); in Castilian and Catalan, *dula* (meaning common pasture); in Portuguese, *acéquiad*, in Castilian, *acequia*; in Catalan, *sèquia* (meaning irrigation ditch); (4) social organization: in Portuguese, *bairro*; in Castilian, *barrio*; in Catalan, *barri* (all meaning district, neighborhood); in Portuguese, *alfama* (meaning Jewish quarter); in Castilian, *aljama* (meaning gathering, quarter); and in Catalan, *aljama* (meaning Jewish or Arab quarter); in Castilian, *arrabal* (meaning poor neighborhood); (in Portuguese, *arrabalde*; and Catalan, *raval* (both meaning suburb); (5) in armed forces and weapons: in Portuguese, *adail* (meaning commander); in Castilian, *adalid* (meaning, champion); in Catalan, *adalil* (meaning captain, guide); in Portuguese and Catalan, *aljava*; in Castilian, *aljaba* (all meaning quiver); in Portuguese and Castilian, *almenara*; in Catalan, *alinara* (meaning beacon, signal fire); (6) mathematics and measurements: in Portuguese and Castilian, *cifra*; in Catalan, *xifra* (meaning figure, cipher); in Portuguese, *fânega*; Castilian, *fanega*; in Catalan, *faneca* (all meaning dry measurement [1.58 bushels]); in Portuguese, Castilian, and Catalan, *nadir* (all meaning nadir, lowest point).

Like many lexical borrowings, these Arabisms were rephonologized to meet the requirements of the various Ibero-Romance sound systems. Lloyd gives two good examples from Old Spanish: (1) the group of Arabic back fricatives—pharyngeal/h/ ʕ, glottal/h/ ʁ, and dorsovelar /x/ ɣ—came into Old Spanish as labiodental fricative /f/; for example, *hatta* (in Old Spanish, *fa(s)ta*, meaning until), *al-hadiya* (in Old Spanish, *alfadía*, meaning bribe) *al-xumra* (in Old Spanish, *alfombra*, meaning carpet); (2) a few Arabic words beginning with voiceless palatal hushed fricative /š/ ش constitute a minor source for the same sibilant in Old Spanish, for example, *šah* (in Old Spanish, *xaque*, meaning king [in chess]) *šarab* (in Old Spanish, *xarabe*, meaning syrup). Note that these are not examples of Arabic phonemic interference in Romance—no Arabic phonemes were taken wholesale into Ibero-Romance—but rather of how Old Spanish, in these examples, used its existing sound inventory to render foreign sounds in loan words.

Arabic nouns are normally presented with the article *al-*, regardless of number and gender; this element has generally been incorporated into the lexeme across Ibero-Romance without the determiner value. The article appears less frequently in Catalan than in Castilian and Portuguese, for example, in Portuguese, *algodão*, in Castilian, *algodón*; in Catalan, *cotó*, (all meaning cotton); in Portuguese, and Castilian, *albacora*; in Catalan, *bacora* (meaning albacore, tuna). The Arabic

relative adjective or *nisba* suffix *-i-* was also borrowed by Castilian, especially for proper substantives related to Islam and Arabs, for example, in Castilian, *marroquí* (Moroccan), *iraní* (Iranian), *pakistaní* (Pakistani) but in Portuguese, *marroquiano*, *iraniano*, *pakistanense*, and in Catalan, *marroquí* (corresponding to the Castilian *marroquino*), *iraníà*, *pakistanès*. Finally, the Arabic patronymic *ibn* was reanalyzed as prefix *ben-* in the formation of family names such as *Benavides* and *Benigómez*.

As for syntactic influences and semantic calques, Corriente (Jayussi 1994, 445–46) rejects widely accepted claims of Arabic influence in paronomastic expressions such as *burla burlando* (to get something unintentionally) and *calla callando* (to get something without making a fuss or being noticed), and in the semantic calques *infante* (son of the king), via Arabic, *walad* (child, son of the king) and *hidalgo* (noble), in Portuguese and Old Spanish, *fidalgo*, via Arabic, *ibn ad-dunya* (son of wealth).

Written sources of Arabic texts from Islamic Iberia include Díaz García's *Devocionario morisco en árabe dialectal hispánico* (1981) and Marugán's *El refranero andalusí de Ibn Asim Al-Garnati* (1994). Major dictionaries relevant to this topic are Corriente's *Diccionario de arabismos y voces afines en iberorromance* (1999) and *A Dictionary of Andalusí Arabic* (1997), and Machado's *Vocabulário português de origem árabe* (1991). A journal, *Estudios de dialectología norteafricana y andalusí* (1996–), is published by the University of Zaragoza.

ARAGÓN, CROWN OF

The Crown of Aragón was a dynastic union of Aragón and the county of Barcelona dating from the betrothal of Petronilla of Aragón and Ramón Berenguer IV of Barcelona in 1137. Their marriage took place in 1150, their son Alfonso was the first of their descendants to assume the title of king, and their dynasty ruled Aragón, Catalonia, and other lands added to the original nucleus until 1410. The term Crown of Aragón, however, dated only from the later Middle Ages. The union remained personal. The ruler was king in Aragón and count in Barcelona, an arrangement not without risk for the Catalans. But little attention was paid at first to constitutional niceties. Records of fiscal administration in Catalonia show that the ruler was "lord king" there, and not simply count, in the later twelfth century. But it is an even more striking fact that the early monarchs and their courtiers held tenaciously to the joint vision of Petronilla and her husband. The court of Alfonso II included Aragónese and Catalanian barons and clerks and the earliest conjoint assemblies of the two (or more) realms, ancestors of the *cortes* (parliament) of the Crown of Aragón, date from the second half of the twelfth century. In most respects, however, and most notably in the sphere of law and privilege, the monarchs were obliged to treat their peoples distinctly. Hence it is customary to speak of them as "count kings."

Under the early count-kings (Ramón Berenguer IV, 1131–1162, whose title was "prince" in Aragón; Alfonso II, 1162–1196; and Pedro II, 1196–1213) the union worked well. Neither Aragón nor Catalonia was neglected, both societies prospered and matured, and joint lordship promoted the expansive ambitions that fired later ages of conquest. Ramón Berenguer IV was the dynasty's first great conqueror. He opened up the frontiers of Catalonia and Aragón for Christian resettlement at the expense of the Moors, annexed Tortosa and Lérida (1148–1149), and encouraged ecclesiastical initiatives. The military Order of the Hospital and Temple were endowed in local commanderies, especially in frontier lands; Cistercian monks established their more austere form of the Benedictine Rule at Poblet and Santes Creus (1150–1153) in Catalonia and later at Veruela and (for nuns) Casbas in Aragón; while the archbishopric of Tarragona was reestablished (1154) with jurisdiction over the sees in both lands. Lay and religious lords encouraged immigration by granting liberal terms of settlements. The later twelfth century was a time of sustained demographic and economic

growth and prosperity. There was movement toward frontier lands from the old uplands of Aragón and Catalonia, but settlers came also from north of the Pyrenees and even from England.

Under Alfonso II something of the expansionist fervor was lost. This ruler's marriage to Sancha of Castile confirmed the vision of a Christian Iberian Peninsula dominated by the two most advantaged crowns. Old understandings with Castile over prospective spheres of Muslim conquest were adjusted in favor of Aragón in the Treaties of Cazorla (1179). Valencia was to be Aragón's, a designation made just when this Moorish realm seemed an inviting prey. But Alfonso, a cultivated man with interests in southern France, had been brought up to distrust the barons and knights whose harsh lordships, especially in Catalonia, had been a cause of complaint for several decades. His programmatic effort to pacify his lands could only have succeeded if he had satisfied baronial demands for the spoils of aggressive conquest. Lacking the militancy of his father, Alfonso let pass the opportunity and it was characteristic that when in 1195 he responded to the threat posed by the Muslim victory at Alarcos it was in somewhat pretentious hopes of leading an all-peninsular crusade. Everywhere interests (they can hardly be called "policies") were more dynastic than territorial. Alliance with the Castilians and Angevins was deployed chiefly in southern France against the perceived threat of an expansionist Capetian monarchy allied with the count of Toulouse. But there was nothing imperialistic about Catalan-Aragónese interests across the Pyrenees. Provence might have remained under a cadet branch of the dynasty had Ramón Berenguer III not been killed (1166) without leaving a male heir; when the boy-king's advisers seized Provence, an old conflict between Barcelona and Toulouse was renewed. At the came of age Alfonso had to cultivate new allies in Béarn, Bigorre, and Foix to offset the disaffection of his old vassals in lower Occitania; but when the viscount Roger II of Béziers, having become vulnerable to the church's campaign against heretics, upset the Toulousan hegemony by commending himself to Alfonso, the count-king's influence in Occitania achieved its maximum success.

Pedro II (Pere I in Catalonia) succeeded his father in Aragón and Catalonia as well as in most of the Occitania suzerainties; his brother inherited Provence, Millau, and Razès. But while the concept of a solely peninsular union thus survived intact, Pedro was to be at once more ambitious and less successful across the Pyrenees than his father had been. He defied tradition by allying with Raymond VI of Toulouse, married the heiress María of Montpellier in 1204, and then had himself crowned at Rome by Pope Innocent III, to

Aragón Kings, 1213–1516

whom he engaged to pay a tribute of submission. The latter event was staged to enhance the count-king's prestige among Christian monarchs. It led Pedro's spectacular role in the united crusading army that crushed the Almohads at Las Navas de Tolosa in 1212. But the Aragónese-papal entente failed badly during the Albigensian crisis. Pedro tried to mediate, then worked to secure hegemony over the meridional lords opposed to the crusaders of Simon de Montfort. All these efforts collapsed in the Battle of Muret (12 September 1213). Pedro was killed and his suzerainties over Béziers, and Toulouse destroyed.

Historians have sometimes exaggerated the import of this disaster. In reality, the trans-Pyrenean lands

had never formed part of the dynastic patrimony, which remained intact, so that disgruntled barons who remembered Ramón Berenguer IV may have been more relieved than upset when the Pyrenean distraction was removed. The child king, nurtured in a regency representing the pope, the Templars, and Aragónese and Catalan notables, learned early what power he had to gain by renewing the anti-Moorish conquest. Hardened by setbacks and factional opposition, Jaime I (1213–1276) led a well-financed and popular expedition against Mallorca in 1229. Catalans dominated in the conquest and resettlement, but townsmen of Italy and Provence joined in what was labeled a "crusade" and shared in the spoils. Gaining annulment of his mar-

riage to Eleanor of Castile in 1229, Jaime waited until 1235 to marry Iolanda of Hungary with papal approval. Meanwhile, impatient Aragónese barons had forced the king's hand in Valencia, seizing Morella in 1232. A more urgent (and dangerous) motive for the Valencian conquest arose from the king's engagement to cede the Balearic Islands and Valencia to the sons of his second marriage.

The conquest of Valencia, projected in *cortes* at Monzón (1236), was achieved relentlessly in 1237–1238. The Moors were permitted to depart in peace, a guarantee made uneasy by Aragónese hopes for loot. The custom of Aragón had prevailed in charters granted in the early phases of conquest, but settlers from Aragón were far outnumbered by Catalans thereafter; and toward 1239 the king ordered a new territorial custom drawn up for Valencia (the *Furs*), eclectic and Romanist, first published in Latin and then (1261) in Catalan. Settlers coming chiefly from the plains of Lérida and Urgell remained the minority in a predominantly Mudéjar population. The conquest was virtually completed with the captures of Játiva (1244) and Biar (1245).

With the annexations of Mallorca and Valencia, Jaime I fulfilled the purpose of his forefathers. He had dramatically enlarged the Crown of Aragón in God's service. But he was no political expansionist, as his later conquest of Murcia on behalf of Castile (1266) was to prove; nor had any public concern for administrative unity overtaken the conception of the royal inheritance as a proprietary condominium. If he reserved the patrimonial realms for his firstborn, Alfonso, when he provided for his second son, Pedro (1241), Jaime seriously proposed, in a second partition occasioned by the birth of a third son (1243), to separate Aragón and Catalonia. This scheme reflected the king's estrangement from Alfonso, whose Castilian sympathies grew stronger as his ambitions were thwarted.

The conqueror's success in Spain was countered by setbacks in southern France. Dynastic hopes were dashed by the failure of the counts of Toulouse and Provence to bear male heirs, for the sons of Jaime I were too closely related to the heiresses to compete for their hands with Capetian princes. Despite urgent negotiations to prevent it, Jaime saw Provence pass to Charles of Anjou (1246) and Toulouse to Alphonse of Poitiers (1249). But while some lament was heard for the passing of native dynasties in the Midi, notably from the troubadours, there is no sign that the conqueror viewed the king of France as other than a fellow crusader. With the Treaty of Corbeil (1258) Jaime renounced all his rights in Occitania, save that over Montpellier, while Louis IX gave up his claim to counties of the former Spanish March. To complete the political

reversal, which recognized Capetian expansion almost to the Pyrenees, Jaime engaged his daughter Isabel to Philip, the heir to France. On the other hand, his son Pedro's marriage to Constanza of Hohenstaufen was to open up a new prospect of Mediterranean expansion at the cost of renewed hostility with France.

Like his predecessors, Jaime found it harder to rule in peace than in war. Thought by the Aragónese to favor Catalonia and by the Catalans to favor Castile, he spent his later years negotiating, organizing, and commemorating. No medieval king revealed himself so well to posterity; his *Book of Deeds* celebrated Jaime's peoples as well as himself in the glow of their most durable triumphs. The reign was marked by continued institutional growth. Registers of administrative correspondence were inaugurated while new forms of elite delegations pointed the way to the vice regencies of later times. The *cortes*, becoming an instrument of political influence in Aragón and Catalonia—and occasionally representing both lands, as in 1236—were instituted also in Valencia. Local administration and law were renovated, while religious life drew new sustenance from the spread of Franciscan and Dominican friars.

Pedro III (1276–1285) succeeded his father, as a grown and tried ruler. In dominating early rebellions and seizing dynastic opportunities, he achieved stunning triumphs while misunderstanding the political costs. He tried to neutralize Castile and France by seizing the Infantes de la Cerda, the disinherited grandsons of Alfonso X and the sons of Blanche of France. He arranged a truce with Granada and renewed a protectorate over Tunis. His Sicilian ambitions became clear when he prepared fleets for service on the Tunisian coasts in 1281 and 1282; his court had long harbored Hohenstaufen dissidents. When the Sicilians rose against the Angevins (30 March 1282), Pedro readied himself for their call and landed at Trapani to a warm welcome five months later. Having received the Sicilians' fealty and confirmed their privileges, he drove the Angevin fleet from Calabrian waters.

Never had a realm been so easily annexed to the Crown of Aragón. But it meant war on all fronts: against Charles of Anjou, who first challenged Pedro to single combat (with comically inconsequential results) and then proceeded to orchestrate a papal-Capetian crusade against Aragón; and against the estates of Aragón and Catalonia, which protested that they had not been consulted about the Sicilian business and that they were being taxed unlawfully. In stormy sessions with the Aragónese, Pedro was finally obliged to confirm a comprehensive definition of their privileges (October 1283). Thus originated the "Union" of Aragón, which was to be a constitutional force for decades

thereafter; the office of *Justicia*, with power to mediate between the king and the Aragóñese, dates also from this time. A similar settlement with the Catalans was reached in a great *cortes* of Barcelona in December 1283. But the hurt ran deep as war loomed with France. When Philip III invaded through the eastern Pyrenees in 1285, Pedro had difficulty mobilizing the defensive and naval forces, which prevailed to drive out the French (October 1285). Within weeks all the protagonists—Philip III, Charles of Anjou, Pope Martin IV, and Pedro himself—were dead.

Pedro III had won Sicily and pacified and defended his realm, but he had fundamentally altered the constitution by conceding baronial and municipal autonomy while allowing the power of the estates to be institutionalized. And it remained to be seen whether the Aragóñese could be reconciled to an expansionist regime partial to Catalanian interests and whether Sicily could be secured against Angevins, Capetians, and popes.

These problems clouded the reigns of Alfonso III (1285–1291), Jaime II (1291–1327), and Alfonso IV (1327–1326). Alfonso III inherited all the realms except Sicily, which passed to his brother Jaime who in turn gave it as a lieutenancy to his younger brother Frederick when he (Jaime) succeeded in the main line in 1291. Settlement with France on terms of an eventual recovery of Sicily by the (Angevin) house of Naples was reached in 1302 but never effected. Jaime II acted with both energy and caution on all his frontiers, extending Catalan influence throughout the Mediterranean, and presiding over general prosperity and growth. In 1302 Catalan mercenaries idled by the end of the Sicilian wars agreed to aid the Byzantine emperor against the Turks in return for concessions that led to their settlement in Greece. After 1311 the Catalan duchies of Athens and Neopatria became dependent on Sicily with the customs of Catalonia; but these colonies were never more than a precarious outpost of the Crown of Aragón (1311–1388). As for Sardinia, which had been ceded by the pope in 1297 in compensation for the renunciation of Sicily, Jaime II entrusted its conquest to his son Alfonso, who carried it out in 1323–1324.

The Crown of Aragón attained its apogee as a federative state during the long reign of Pedro IV (Pere III in Catalonia, 1336–1387). He reintegrated Mallorca in the dynastic polity and imposed himself on the Aragóñese by force, effectively undoing the union. He met his match in Castile, however, where Pedro the Cruel followed by Enrique of Trastámara proved worthy adversaries with superior resources. In 1375 Pedro IV settled on terms of the territorial integrity of Aragón while ceding his claims to Molina and Murcia. In a

further agreement of unforeseen importance, the Infanta Leonora of Aragón was betrothed to Juan of Trastámara.

These events confirmed the federation's Mediterranean destiny, though it was not an easy one. Jaime IV made a desperate attempt to recover his ousted father's title to Mallorca in 1374. Sardinia remained turbulent, a prey to Genoese ambitions. The Sicilians for their part had come to think of the Catalan dynasty as foreign. Pedro failed to persuade his son to marry the heiress to Sicily, although she finally married the son of Pedro's second son, Martin, who in 1380 assumed viceregal powers in Sicily. When in the same year the Catalan duchies submitted to him, Pedro had achieved domination of a vastly extended Crown of Aragón, but at high cost, for the *cortes* of the old realms had wrung major concessions to their autonomy for their grants of subsidy. Moreover, the acquired lands remained restive: the duchies in Greece were lost in 1388, and Pedro's sons Juan I (1387–1395) and Martín I (1395–1410) were severely challenged in Mallorca, Sardinia, and Sicily.

Martín's death without heirs in 1410 brought the dynastic line to an end. Among contenders for the crown, the favorite in Catalonia was Jaime of Urgell, a direct descendant of Jaime II. But Jaime antagonized the Aragóñese, opening the way for the candidacy of Fernando of Antequera, grandson of Pedro IV and uncle of the king of Castile. In 1412 electors chosen by parliaments in the peninsular realms met at Caspe and decided in favor of Fernando. Jaime rebelled, but was soon captured and imprisoned.

It was a fateful turning point, the dynastic ratification of Castile's demographic and military superiority. Fernando and his sons ruling after him—Alfonso V (Alfons IV in Catalonia), 1416–1458, and Juan II, 1458–1479—were Castilians in real and constant danger of losing touch with their subjects. Meeting resistance in Catalonia and Aragón, Alfonso V clung to power in Sicily and Sardinia and aspired to the succession in Naples, which he conquered only after years of negotiations and fighting in 1443. There he remained, leaving Catalonia to be ruled by his wife and other realms by viceroys. Seeking to create in Naples a dynastic preserve for his illegitimate son Fernando, Alfonso made some effort to revive Hohenstaufen administrative efficiency while patronizing literature, music, and theology and drawing heavily on revenues from Sicily and Catalonia.

Hopes for the best gave way to despair in the peninsula. Aragón bore the financial brunt of Prince Juan's self-serving yet futile conflicts in Castile. Mallorca was set back by renewed war with Genoa and agrarian disorder. Only Valencia seemed relatively free of the

social unrest and economic dislocation that afflicted the other realms, Catalonia above all. Lacking firm direction, the *cortes* had fallen prey to searing antagonisms among the estates themselves and against royal agents trying to recover alienated patrimony. King Alfonso began by siding with the old aristocracy, but as their financial support dwindled he revived an old royal program of agrarian reform. This was to aggravate a smoldering conflict between landlords and peasants in Old Catalonia, where one of the most repressive modes of lordship in western Europe had survived. Moreover, royal efforts to undermine patrician dominations in the towns caused trouble from the 1440s, especially in Barcelona, where a party of "honored citizens" (the *Biga*) was opposed by merchants and artisans. (Existing tensions worsened under Juan II, whose insensitivity to all, including his popular son Prince Carlos, precipitated a revolt of the *remença* peasants. The Council of Catalonia raised an army to put down the rising, while Queen Juana tried to impose a settlement on the peasants and then allied with their leader. Meanwhile, the king's pledge of Roussillon and Cerdanya to Louis XI in return for French intervention fired a resurgence of antiroyalist patriotism. But the Catalan cause so-called failed to elicit much response in the other realms, and its desperate bids to replace Juan with foreign rulers miscarried. In the end Juan prevailed through patient efforts. Girona and Barcelona returned to his fidelity in 1472, and the king confirmed Catalanian privileges. But the *remença* conflict continued, as did disorders in Aragón, Valencia, and Sardinia. Juan's son Fernando, having married Isabel of Castile in 1469, became king consort in Castile in 1474 and succeeded his father in the Crown of Aragón in 1479. The old dream of Hispanic hegemony was realized at last—in favor of a Castilian dynasty.

The Crown of Aragón had been an administrative state since the thirteenth century. It was not really an empire, nor were its institutions generated from some preconceived ideal of dynastic expansion. The vice-royalties and procuratorships of the later Middle Ages were descended from delegations of Provence in the twelfth century; they remained patrimonial lordships as well as offices to the end. Moreover, the insistence on privilege in each of the realms impeded the development of pan-regnal administration, although in various ways Jaime II, Pedro IV, and their successors promoted a community of interest. Federative impulses, such as the founding of a university at Lérida (1300) or the declaration that the realms be indivisible (1319), had little meaning outside the original nucleus of Aragón and Catalonia. The strength of the union, such as it was, lay in Catalonia's mercantile and maritime energies, with Aragón and Sicily cast in the role of agrarian

suppliers. But the federation was vulnerable to social, technological, and demographic constraints. Everywhere the multiplied working masses were forced into harsh and resented dependencies, while communications, investment, and banking lagged behind real needs. Moreover, the peninsular realms lacked sufficient populations to compete with Castile in the long term. Totalling perhaps 1,500,000 people before the Black Death, Catalonia, Aragón, and Valencia struggled to rebuild even as their rulers pretended to lordships stretching from one end of the Mediterranean to the other. The federation's culture remained primarily Catalan. Whatever its limitations, the Crown of Aragón was one of the most durable dynastic polities of the Middle Ages. It was a major factor in Mediterranean history.

ARAGÓN, KINGDOM OF See ARAGÓN, CROWN OF

ARAGONESE LANGUAGE

The county (later, kingdom) of Aragón originated in areas close to the Pyrenees Mountains, separating modern France and Spain, taking its name from the river Aragón. It was formed by the union of three counties: Aragón, Sobrarbe, and Ribagorza. The movement of colonists to the plains to the south led to the conquest of the Moorish city of Zaragoza in 1118, and eventually included Catalonia (1137) and other areas to the south such as Teruel, Valencia, Alicante, and the Balearic island Mallorca (in the thirteenth century).

The Ibero-Romance dialect of these areas reflects the position of Aragón between Catalonia to the east and Castile to the west. Castile came to exert an especially powerful influence, as its dialect began to im-

pose itself as the standard language of the kingdom of Castile and León. The distinctive phonetic features of Castilian came to be considered standard and tended to overwhelm local features relegated to more isolated rural regions.

Aragonese shares with Castilian, Leonese, and the Mozarabic dialects of the south the diphthongization of Late Latin *e* and *o* in all tonic syllables, regardless of phonetic circumstances. Although the *e* for the most part gave the same result as in Castilian—namely, *ie* as in *tiempo* (“time,” from *tempus*) or *miel* (“honey,” from *mele*)—there was considerable fluctuation in the phonetic result, especially in the earliest years, with forms like *ia* also being found, as in *hiarba* (“grass,” from *herba*) and *diande* (“tooth,” from *dente*), in a limited area. Similar fluctuations appear in the form of the diphthong from *o*: *fuoro* (“municipal statute,” from *foru*) vs. *cuallio* (“neck,” from *collu*), *buano* (“good,” from *bonu*), and *ue*: *pueio* (“hill,” from *podiu*). The result, *ua*, is much more widespread than *ia*.

Diphthongization also is found before the yod, unlike Castilian, which maintains a single vowel, as in *fuella* (“leaf,” from *folia*), *tiengo* (“I have,” from *teneo*; cf. Cast. *hoja*, *tengo*). The final *-e* was frequently lost, as in Old Castilian; *fuent* (“fountain,” from *fonte*); the final *-o* also tended to be lost, especially in the most mountainous areas and in eastern Aragonese, in consonance with this same feature in Catalan: *blan* (“soft, smooth,” from *blandus*).

As for consonants, upper Aragonese retained the initial *f*, in sharp contrast with its loss in the more southern dialects under the influence of Castilian: *fuyir* (“to flee,” from *fugere*) and *fambre* (“hunger,” from *famen*). The initial palatal fricative of Late Latin was kept as a hushing fricative, as in most of western Romance languages (excepting again Old Castilian): *germanos* (“brothers,” from *germanos*), and *geitat* (“he throws,” from *jactat* [z-]). Initial groups of consonant-plus-lateral are also retained: *plorar* (“to weep,” from *plorare*), *clamar* (“to call,” from *clamare*), and *flama* (“flame,” from *flamma*). The palatal lateral of Late Latin (resulting from the yod) was generally retained: *güello* (“eye,” from *oc(u)lu*), and *viello* (“old,” from *vet(u)lu* [bek’lu]).

One of the most notable features of upper Aragonese phonetic development was the preservation of the intervocalic voiceless stops, which in almost all other dialects of western Romance became voiced: *arripa* (“bank of a stream,” from *ripa*), *cuta* (“sharp,” from *acuta*), and *paco* (“obscure,” from *opacu*). The voiced intervocalic stops likewise tended to be preserved, in contrast with Castilian, where they were frequently lost, especially in contact with front vowels.

Various explanations have been sought for this preservation, including the possible influence of Basque, but it seems more likely that it is simply a reflection of the isolated nature of upper Aragonese that escaped this particular phonetic innovation of late western Latin/Romance. Another distinctive feature of Aragonese was the voicing of voiceless stops after liquids and nasals: *planda* (“plant,” from *planta*), *cambo* (“field,” from *campu*), *aldo* (“tall,” from *altu*), *ordiga* (“thistle,” from *urtica*), and *bango* (“bench,” from the Germanic *bank*). Directly related to the preceding change were assimilations of voiced stops to preceding liquids and nasals: *amos* (“both,” from *ambos*; likewise found in Castilian), *fonno* (“base, depths,” from *fundu*), and *retuno* (toponym, “round,” from *rotundu*). Menéndez Pidal’s theory attributing the preceding changes to the Latin brought by speakers from southern Italy who also spoke Oscan is well known but has been questioned.

One other distinctive feature of some Aragonese dialects is the occlusive pronunciation of the Latin *l*: as either *t*, *ts*, or *c*; for example: (*bielsa*) *betieco* (“calf,” from *vitellu*), *estibieco* (toponym, *lanuza*, “summer pasturage,” from *aestivella*), and many other toponyms. This change recalls similar occlusive pronunciations of the geminate *l*: in Gascon, as well as that found in some Sardinian and south Italian dialects. Loss of final vowels allowed for the existence of words ending in consonants and consonant groups that are characteristic of Catalan (and also during some centuries, Old Castilian): *-nt* as in *fuent* (“fountain,” from *fonte*), and especially in the formation of plurals: *labradors* (“peasants”), *cochins* (“pigs”), and *arbols* (“trees”).

In morphology the forms of the masculine definite article are *lo* and *o*, as well as forms reflecting the geminate lateral *l*: of earlier Latin: *ro* and *ra*, similar to the Gascon form *ero* and in some isolated areas *es* from *ipse*, used as a plural, as in *es arbres* (“the trees”). All compete with the Castilian *el*. Some adjectives tend to adopt the marked feminine ending *-a*, where other western Romance languages preserve the Latin third-declension common masculine/feminine ending: *berda* (“green,” from *viridem*), *dolienta* (“suffering, aching,” from *dolentem*), *jovena* (“young,” from *iuvenem*), and *granda* (“large,” from *grandem*). In verb morphology, the preservation of intervocalic voiced consonants left the *-er* and *-ir* conjugations with the *-b-* of the Latin imperfect are found, and a first- and third-person plural form based on the third singular: *-omos*, *ón*. The *-er* and *-ir* conjugations had a perfect in *-ié*: *vendié vendiés*, *vendié*, and so on.

In word formation, *-az(o)* appears as an augmentative more than in standard Castilian: *inocentaz*, *pobraz*,

narizaza ("big nose"). The diminutive suffix *-ico* is often thought to be especially characteristic of Aragonese, although it is found all over the Iberian peninsula: *jovencico* ("young [one]").

Written sources of medieval Aragonese, in addition to Tomás's *Documentos*, are found in editions like Tilander's *Fueros de Aragón* (1937) and Cooper's *Liber regum* (1960).

ARCHEOLOGY

Spanish medieval archeology as practiced in the 1930s and 1940s was politically conservative and designed in general to corroborate pan-Germanist hypotheses demonstrating medieval Iberian culture's linkages to a Germanic cultural zone. As in the rest of Europe, some work was done on ecclesiastical buildings and castles, mainly from the standpoint of artistic styles and motifs. Gómez-Moreno's study of Mozarabic churches (1919) is a model of the latter, though as much architectural as archeological in character. On the Islamic side, the journal *Al-Andalus*, from its inception in 1932, featured an archeological section conducted mainly by Leopoldo Torres Balbás and centered primarily on urban architecture and artifacts. During the 1930s, Torres was conservator of the Alhambra. Pan-Germanism was pushed during the Franco period, as was an abortive attempt to create a "Christian archeology."

In the late 1970s, under the stimulus of Pierre Toubert's 1978 Rome meeting on *incastellamento*, the process whereby in the early years of feudalism the landscape was reorganized in much of western Europe into "castral units" linking castle with dependent villages, a wave of extensive archeology ensued, mainly in Aragón, Valencia, Mallorca, and areas of Almería and Granada, broadly under the direction of archeologists and historians associated with the Casa de Velázquez. Extensive archeology consists mainly of broad-

scale field surveys and site inspection, with only surface collection of ceramic remains. The key workers here were Pierre Guichard, André Bazzana, and Rafael Azuar working in the Valencian region; Patrice Cressier and Maryelle Bertrand in Almería; Antonio Malpica in Granada; and Philippe Sénac and Carlos Esco in Aragón. The picture of rural life in al-Andalus that emerged was a countryside organized in complexes of castles (*husun*; singular, *hisn*) and villages (*qura*; singular, *qarya*; in Spanish, *alquería*), the latter organized tribally, at least at the time of their initial settlement, and typically practicing irrigation agriculture. Clan settlement of villages explains the plethora of current and disappeared villages beginning with the particle Beni- "sons of," as in Benigazló, from the Nafza Berber Ghazlun clan or Benisanó from the Hawwara Berber Zannun clan, both in the province of Valencia. In addition to villages, castral units included private parcels called *rahals*, owned typically by persons who had held high state office.

In general, the husun were not permanently garrisoned but served as refuges for the villages and their beasts in times of insecurity. At such times, the state would dispatch a *qā'id* (captain) to oversee the castle, to the see to make sure that it was provisioned with wood and water (which appears to have been a peasant obligation), or else to collect taxes owed the state. That is, the model does not envision a feudalized castle, with a permanent garrison and castellan whose role is to control the peasantry.

The irrigation element has been studied by Cressier in the Sierra de Filabres and by Miquel Barceló and members of his group at the Autonomous University of Barcelona working at sites in Mallorca, Albacete, Andalusia, and Castellón de la Plana. In Mallorca and Albacete they found long canal systems broken down into segments, each terminating with a mill; it is supposed that each segment represents an original clan settlement unit. Barceló's hypothesis that Andalusian mills, typically terminate hydraulic systems in which the systems are secondary to irrigation can be contrasted with Catalan feudal mills heading systems. The idea that the latter in irrigation is an afterthought has both generated controversy and drawn attention to the hydraulic structuring of castral units. Barceló's team has also studied the distribution and use of small-scale *qanats*, or filtration galleries, particularly in Mallorca, where they were built by peasants using common technology.

A third team, headed by Karl Butzer and Joan Mateu, studied irrigation agriculture (but not in conjunction with castral units) in the Sierra de Espadán, Castellón. Butzer types irrigation systems by scale: macrosystems corresponding to the great periurban

huertas (growing fields) of Valencia and Murcia; and meso- and microsystems corresponding to mountain villages and hamlets. The latter he believes to be of Islamic foundation, the former of Roman or pre-Roman base. Butzer, however, sees little innovation in what he describes as Mediterranean agro-irrigation systems of ancient provenance and notes that the same roster of crops were grown there by Romans and Muslims alike.

The study of pottery, in particular, by Juan Zozaya and Sonia Gutiérrez has allowed archeologists to define a paleo-Andalusi period extending from the Islamic conquest into the early tenth century and characterized by the persistence of late Roman pottery forms and ceramic techniques. This repertory is unglazed, typically made on turntables rather than kickwheels, and was limited to a few standard cookwares such as the *olla* and the *marmita*. Zozaya extends the concept of paleo-Andalusi culture to include such phenomena as the sharing of cemeteries and churches by Muslims and Christians, bilingual coinage, and certain architectural features; while Gutiérrez, Azuar, and Mateu have described early irrigation development in littoral marshes of the Lower Segura River basin dating to the eighth century, anteceding the development of the high medieval *huertas*.

On the Christian side some incastellamento studies have been carried out for Catalonia, and a great many ceramic studies document the diffusion and decline of Catalan greywares. Manuel Riu in particular has described this industry and its primitive firing techniques. Later, with the conquest of Valencia, the narrow roster of wares traditionally used by Catalans was vastly increased owing to contact with Mudéjar potters.

The Asociación Española de Arqueología Medieval, founded in 1985, edits a journal (*Boletín*) and holds biennial meetings with published acts.

ARCHITECTURE

Civil Architecture

Civil architecture includes both public and private buildings whose functions were not primarily related to religious life. Houses and palaces; government, commercial, and recreational buildings; as well as baths, hospital, and bridges, are among the numerous examples of civil architecture in medieval Iberia.

While substantial remains of Roman public and domestic architecture exist in Iberian cities like Mérida, evidence of civil structures from the earlier Middle Ages is scant. In some cases Roman civil structures were maintained during the Middle Ages, a good example being the so-called Alcántara bridge across the Tagus River at Toledo, which was rebuilt by the Muslims during the tenth century. The later St. Martín bridge in the city is an entirely thirteenth-century construction, built during the reign of Alfonso X and utilizing a series of pointed arches. Christian settlers in newly reconquered towns like Zaragoza (1118) or Cuenca (1177) acquired the formerly Muslim baths in those cities, and in Girona the Muslim baths were rebuilt using stone and date to the later thirteenth century.

The most prevalent form of civil architecture in medieval Iberia is the noble residence, whose primary development took place in urban settings beginning in the twelfth century. An example from the earlier Middle Ages is the two-story rectangular structure now known as Srenta. María de Naranco outside Oviedo, sometimes identified as the palace of Ramiro I (842–850). The upper story of this building is a barrel-vaulted rectangular room with carved capitals and porches extending on either side and an exterior staircase leading to the ground level below.

Though defensive elements occasionally remain a feature of the design (such as the towers in the early-thirteenth-century La Zuda Palace in Lérida), the noble residence is not primarily a military structure. A well-known twelfth-century example is the so-called Palace of the Dukes of Granada in Estella (Navarre). The ground level has a porticoed facade while the first story is pierced by a series of narrow, arched windows separated by thin colonnettes. In addition to the porticoed type, plain facades opened only by a single arched doorway are also a common design for the noble residence. This type is repeatedly illustrated in thirteenth-century miniatures of the *Cantigas* of Alfonso X, while an extant example exists in Tárrega (Lérida). The persistence of this design can be noted in the early-sixteenth-century Palacio de Ovando Solís in Cáceres, which also retains a fortified tower and machicolations above the entrance.

The majority of urban palaces date from the later fourteenth and fifteenth centuries. The palace at Torde-sillas (León) was built for Alfonso XI beginning in 1340 and its Islamic-inspired exterior and interior decoration is entirely the work of Mudéjar craftsmen. Examples of later medieval noble houses survive in a number of Iberian towns including Cáceres, Avila, Salamanca, and Santiago de Compostela.

Many noble houses were designed around an interior patio surrounded by an arcade or first-story gallery. Fourteenth-century examples are preserved at Torde-sillas and the Episcopal Palace at Tortosa. Royal palaces also often contained larger meeting or assembly rooms (*salones*). One of the earliest preserved is located in the Episcopal Palace at Santiago de Compostela (mostly from the thirteenth century), consisting of a narrow rectangular space (31.9 by 8.3 meters) covered with low ribbed groin vaults springing from engaged piers on the lateral walls. Later examples include the much larger “Tinell” salon in the Episcopal Palace in Barcelona (1359–1370). This salon measures 33.7 by 17 meters and consists of a series of six grand transverse arches supporting a wooden roof. In other palaces interior columns or piers divided the space into a series of vaulted compartments, as seen in the ruins of the thirteenth-century palace at the monastery of Carrecedo, built for the sons of Alfonso IX. The construction techniques used for royal *salones* and patios are similar to those that appear earlier in chapter houses, refectories, cloisters, and dormitories associated with monastery and cathedral complexes.

Other forms of civil architecture in the later Middle Ages demanded large and open interior spaces. Economic and urban expansion in Catalonia during the later thirteenth and fourteenth centuries produced a number of novel administrative and commercial buildings. The Salon of the Council of the One Hundred in Barcelona was built toward the end of the fourteenth century to accommodate the assemblies of this municipal institution, which had previously met in local monasteries. The wooden ceiling of the rectangular salon is supported by a series of tranverse arches and the lateral walls are pierced with round windows embellished with tracery. The facade, dated at 1400–1402, follows the basic exterior form of the noble residence, but features smooth stonework and more elaborate and delicately carved Gothic ornament around the doorway and first-story windows.

The mercantile exchanges (*lonjas*) built in Catalonia were tall columned structures enclosing vast interior spaces. The Lonja in Barcelona dates to the second half of the fourteenth century. Its salon is a large rectangle measuring 33 by 21 meters, divided into three

aisles by two series of tall arcades carried on piers supporting a wooden roof.

While the existence of hospitals is documented throughout the Middle Ages in Iberia, the late-twelfth-century Hospital del Rey in Burgos (now demolished), founded by Alfonso VIII, is among the earliest examples of a structure built expressly for the purpose of caring for the infirm. Constructed along the lines of a basilica, with a tall central nave supported by octagonal piers, the entrance to this structure was from one of the lateral sides, with beds probably located in the aisles. Other cities along the pilgrimage roads also had facilities for the sick, housed in monasteries or private residences. Hospitals built in Santiago de Compostela (Hospital Real) and in Toledo (Hospital de Santa Cruz) at the end of the fifteenth century followed a cruciform plan.

Despite some neglect and decay, the legacy of civil architecture in Medieval Iberia provides the basis for significant insights into secular life beyond the scope of castle, church, and monastery. The extant types and individual examples, dating predominantly to the thirteenth century and later, remain a viable record of the residential, mercantile, municipal, and infrastructural concerns of the men and women of the Middle Ages.

Ecclesiastical Architecture

The planning and construction of religious buildings demanded a significant measure of the economic, intellectual, and technical resources of the Middle Ages. The medieval church functioned variously to commemorate sacred sites, provide a setting for the ritual of mass and the veneration of relics, serve as the focus of monastic life, accommodate large numbers of pilgrims, and provide assurance of salvation for those whose donations paid for their expense. The history of medieval ecclesiastical architecture in Spain demonstrates the strength and continuity of native building traditions as well as their transformation by the individuals, events, and circumstances that affected the whole of Iberian culture.

The dominant type of church in Iberia and throughout western Europe during the Middle Ages was the basilica, rectangular in shape and directional in its focus upon an altar. The altar was located within a square or semicircular apse that projected from this simple rectangular form. During the Middle Ages this basic plan was modified to include a transept perpendicular to the nave and located in front of the apse often projecting laterally to form a Latin Cross; aisles flanking the central hall or nave and separated from it by series of cylindrical columns or square piers sup-

porting arches; and an enlargement of the apse with additional chapels adjacent to it or radiating from a walkway (ambulatory) surrounding it. In addition to the dominant basilican plan, examples of equal-armed Greek Cross churches also exist, with central rather than longitudinal focus.

Most larger early medieval basilicas were timber roofed, but stone vaulting, especially in the apse or transept is not unknown even in earlier periods and becomes more general by the middle of the eleventh century. Basilican churches were also enriched through the construction of a gallery or triforium above the aisles and a more complex treatment of piers that occurs with the development of more intricate methods of vaulting.

The primary building material in ecclesiastical architecture is smoothly hewn stone, varied in color and texture depending upon region. Other materials include spolia (reused parts of Roman buildings), rubble and irregular stone for vaults (or interspersed with courses of cut stone), and brick, which occasionally appears above doorways and windows or is the dominant building material in some styles. Medieval churches were often embellished with relief sculpture or fresco decoration. Related buildings, particularly in a monastic setting, served varied aspects of religious life: these include cloisters, refectories, chapter houses, and dormitories.

Construction was often a protracted process, and the results are not always homogeneous: churches begun during one period were often completed or modified at a later time and under different circumstances. Wherever possible the dating of ecclesiastical buildings is made on the basis of documentary evidence in the form of inscriptions, charters, or chronicles, and relative chronologies are established on the basis of visual similarities with documented buildings; all dating is subject to revision stemming from the reexamination of documents and the uncertainty of later rebuildings and restorations. Also, the progression of styles generally used to designate medieval architecture is not always applied appropriately in Spain. Therefore the material is divided into periods corresponding to major events in Iberian Medieval history.

586–711: The Visigoths to the Muslim Invasion

From the period following the conversion of King Reccared to orthodoxy (589) until the Muslim invasions of 711, literary and archeological evidence reveal the existence of as many as sixty churches in the Iberian Peninsula, of which no fewer than six preserve substantial parts of their original construction. These survive mainly in areas north of the Duero River, but

it is likely that important Visigothic churches also existed in major urban centers like Seville and Toledo.

The basilica is the most common plan adopted for churches of the sixth and seventh centuries, but there is great variety among individual monuments and examples of the Greek Cross plan also exist. The scale of these buildings is small, with few more than 25 or 30 meters in length. In some cases, such as that of Santa Comba de Bande, Orense, similarities have been noted with Late Roman buildings in Ravenna, such as the fifth-century Mausoleum of Galla Placidia. Also characteristic of Visigothic churches are the use of the horseshoe arch and the importance of relief sculpture in the form of capitals and friezes.

San Pedro de la Nave (late seventh century) is a well-preserved example located near Zamora. Although basilican in plan, it may best be described as a progression of longitudinal and square spaces with attention focused upon the tall groin-vaulted square tower near the center of the plan whose supporting piers are embellished with attached marble columns and carved capitals illustrating scenes from the Old Testament. San Pedro de la Nave is built of heavy blocks of stone, with brick and rubble used occasionally for vaults and the upper portions of walls. The interior tends to be dark with massive, solid walls and vaulted areas keeping direct illumination at a minimum.

Despite their modest size, the achievement of the Visigoths in ecclesiastical architecture is impressive and hardly less remarkable than the oeuvre of the Church Father, St. Isidore of Seville (d. 639) and the seventh-century compilation of law known as the *Liber Iudicorum*. San Pedro de la Nave and other surviving churches are admirable technically and in their preservation of Roman building traditions both in Spain and elsewhere in the Mediterranean World.

742–1031: The Asturian and Leonese Kingdoms to the Fall of the Caliphate of Córdoba

During the late eighth and ninth centuries, Christian architecture was confined almost exclusively to the extreme northeast region of Galicia, protected from Muslim raids by the rugged terrain of the Cantabrian mountains. With progress in the Reconquest and the shifting of the Christian capital to León, architectural activity in the tenth and early eleventh centuries extended south to the valley above the Duero River and east to Castile and Catalonia.

Located primarily around the successive strongholds and retreats of the Asturian kings, examples of late eighth and ninth century architecture are often ambitious in scale, inventive in their proportions, and

striking in their often rich decoration. San Julián de los Prados (Santullano) on the outskirts of Oviedo is a spacious three-aisled (40 meters in length) basilica built toward the end of the long reign of Alfonso II (791–842). The nave arcade consists of piers supporting round arches, and there are three barrel-vaulted square apses. Although barely visible today, its arcades, walls, and vaults were decorated with fresco decoration from which both human and animal forms are conspicuously absent. San Miguel de Lillo on Monte Naranco just east of Oviedo (842–850) is a smaller basilica with a gallery above the entrance porch and a strong emphasis upon height in the tall central vaults (originally the church extended farther to the east). Building materials are primarily a combination of cut and rough stone with the occasional use of brick for the construction of arches.

The number of ninth-century ecclesiastical structures is small, but extant examples strive for dramatic effect in proportion and decoration, and mirror the aspirations of the nascent Asturian kingdom for legitimacy, recognition, and authority in Christian Spain. The architecture of this period (see also the preceding section, Civil Architecture) is contemporary with the first battles of the Reconquest and the compilation of exegetical texts on the Apocalypse by the monk Beatus of Liébana known as the *Beatus Commentary*.

A substantial number of ecclesiastical monuments from the tenth and early eleventh centuries were built in a region south and southwest of León and just north of the Duero River; other examples survive from Castile and Catalonia. The architecture from this period primarily served monastic communities who settled in areas of the Duero Valley claimed by the kings of León. These communities practiced their Hispanic rite and pursued a spiritual ideal amid the uncertain security of their isolated location on the frontier with Islam; indeed, Islamic military reprisals made at the end of the tenth century under al-Manṣūr destroyed many foundations such as Valeránica in Castile and Tabara in southern León. The term *Mozarabic* (literally Christians living under Muslim rule) is accurate only insofar as place names, dedications, and chronicles indicate that many of the monks were refugees from Muslim territories.

Among the largest and best preserved churches of the period (30 meters in length) is San Cebrián de Mazote (early tenth century) in southern León. Mazote is a three-aisled basilica with a horseshoe-shaped apse flanked by square chambers covered with groin vaults. Melon-shaped domes cover the apse and three tall spaces of the transept. A series of five horseshoe arches supported by marble columns divide the nave from the aisles. A horseshoe-shaped apse is also lo-

cated at the opposite end of the nave, while the entrance to the church is from the south aisle. The columns at Mazote are slender, the interior light and delicate owing to the smooth stonework, stucco surfaces, crisp contours of the horseshoe arcade, and the height attained in the domed areas. Islamic-inspired features on the exterior of the church include the framing of horseshoe arches (*alfiz*), the use of small double-arched windows (*ajima*), and the use of alternating orange and white stones above an arched doorway at the north transept (compare the Great Mosque at Córdoba). Tenth-century churches achieve a degree of sophistication and elegance not found earlier in the peninsula, and are contemporary with the flowering of the art of manuscript painting which produced some of the greatest masterpieces of early–Middle Age Apocalypse illustration to be found anywhere in Europe.

1031–1212: The Christian Kingdoms of Spain to the Battle of Las Navas de Tolosa

During the later eleventh and twelfth centuries, territorial expansion and settlement, economic growth, urbanization, and the zeal of monastic reform and the Roman Catholic Church supported an eruption of architectural activity in Catalonia, along the pilgrimage roads from Jaca to Compostela, and southward into the broad area between the Duero and Tagus Rivers. Churches of this period are characterized by stronger receptivity to building styles and influences beyond the Pyrenees, provisions for lay worship with a resulting augmentation of scale, ambitious vaulting techniques, and impressive programs of monumental relief sculpture. Contemporary with the buildings of this period are the fall of the caliphate of Córdoba (1031), the Christian Reconquest of Toledo (1085) and Zaragoza (1118), the introduction of the Roman rite into Spain (1080), the First and Second Crusades (1095 and 1147), and the influences of the French Monastic reform movements of Cluny and Cîteaux.

The churchman Oliba (d. 1046), bishop of Vich and abbot of Santa María de Ripoll and San Michel de Cuxá, sojourned to Italy and is usually regarded as the force behind the adoption of novel architectural forms in his native Catalonia. The five-aisled basilican plan of Ripoll (consecrated 1032) shows a wide transept with a series of semicircular chapels extending toward the rear, two square towers, and an overall length of 60 meters. The exterior is articulated with a series of round (not horseshoe) arches, in low relief below roof level, deriving from Lombardy. While Ripoll is not vaulted, other Catalan churches of this period employ barrel vaults and compound pier supports

(e.g., San Vicentes de Cardona, 1040) in their naves, an ambitious feature in churches of this size.

Another major achievement of the period was the building of the Cathedral of Santiago de Compostela in Galicia, which housed the tomb of the Apostle James (Santiago), discovered in the ninth century. Construction began as early as 1075 and was completed during the years 1122–1128. The church is a monumental five-aisled barrel-vaulted basilica with gallery and transept; and ambulatory connects the transept with the main body of the church, and communicates with a series of radiating chapels. The overall length is 90 meters. The size and plan show strong similarities with the church of St. Sernin in Toulouse, built during the same period and located along the popular pilgrimage road to the tomb of St. James. Settlement and traffic along the road prompted cultural development across northern Spain. The construction of St. Sernin may have begun earlier than at Compostela, but the architecture of the pilgrimage roads is best seen as the result of interaction and exchange between Spanish and French masons and sculptors rather than as an importation. Aside from the Cathedral of Santiago de Compostela smaller pilgrimage road churches of the early twelfth century include the Cathedral of Jaca and the churches of San Isidoro in León and San Martín de Fromista. Many of these structures also included elaborate programs of relief sculpture for doorways and capitals.

Amid the progress of reconquest and repopulation of the Duero Valley, architectural activity in Iberia continued throughout the twelfth and thirteenth centuries, assimilating a wide range of elements both from trans-Pyrenean and Mediterranean cultures. Beginning in the third quarter of the twelfth century, pointed arches and ribbed groin vaulting, elements of the French Gothic style in architecture originating in the Ile de France, appear in Iberia first in the portal and porch added at the west front of Santiago de Compostela (Pórtico de la Gloria), as well as in a number of other monuments including the cathedrals of Avila, Zamora, Tarragona, and Lérida. In some cases the architect's name suggests a French origin (for example, Master "Fruchel" for the rebuilding of the cathedral of Avila) while in others the result suggests a synthesis of varied foreign elements by a native artist. Reasons for the incursion of this French style may be found in the success of Cistercian monasticism in Spain during the second half of the twelfth century and in the travels to France and impressions of influential prelates such as Martín de Finojosa, abbot of the Cistercian monastery of Huerta and adviser to Alfonso VIII. The early cathedrals built in the Gothic style in Spain, like those of Avila, are large-aisled basilicas with massive com-

pound piers supporting the pointed arches and groin vaults of the nave. Avila includes a triforium above the aisles and an enlarged apse with tall arcade surrounding the main altar.

Despite its dominance in the later Middle Ages the Gothic style was only one source of inspiration in the buildings of the later twelfth and early thirteenth centuries. The carved ornament in the cathedrals of Lérida and Tarragona owes much to the persistence of Islamic artistic traditions following the Reconquest, as does the dome covering the octagonal church of Torres del Río in Navarre or the ornate crossing dome in the otherwise austere early Gothic interior of the cathedral of Zamora.

Yet another indication of this process is the existence both in Sahagún and in Toledo of a number of modest churches built in brick and *mampostería* (rubble and mortar alternating with courses of brick) and based upon a tradition of architecture found in many urban centers of Muslim Spain. Sometimes called *mudéjar*, after the Muslim populations that remained following the reconquest of their cities, churches like the small Toledan basilica of Santa Cruz (ca. 1200) employ horseshoe arches and brickwork patterns of intersecting and polylobed arches on the exterior based upon the vocabulary of Islamic art. Examples of Mudéjar architecture from the early thirteenth century may be found near Madrid (San Martín de Valdilecha) and later in other areas formerly occupied by Muslims, such as Daroca and Teruel in southern Aragón. The originality of this period in Iberian ecclesiastical architecture seems to lie in its variety and creative assimilation of elements of both Mediterranean and trans-Pyrenean styles. These artistic developments are contemporary with other cultural achievements such as the founding of the University of Salamanca (early thirteenth century) and the emergence of Toledo as a center for the activities of scholars and translators.

1212–1492: The Christian Kingdoms of Spain from 1212 to the Fifteenth Century

Following the Battle of Las Navas de Tolosa and during the reconquest of the Muslim strongholds of Córdoba (1236), Seville (1248), and Valencia (1248), the Christian kingdoms of Spain embarked upon a period of ambitious ecclesiastical building throughout the thirteenth century under the guidance of influential bishops in the cities of Toledo, Burgos, and León. The grand cathedrals erected in the cities of Castile were built in a style based upon the major examples of Gothic architecture in northern France: the cathedral of Toledo had as its first architect a "Master Martín," perhaps called from France by its archbishop Rodrigo

Jiménez de Rada, who was educated in Paris. Toledo is a five-aisled basilica with (nonprojecting) transept and flying buttresses. It measures 120 meters in length and towers over the other buildings of the city. While grand in scale and spacious throughout, Spanish Gothic churches and cathedrals of the thirteenth century tend to achieve more balanced proportions as opposed to the preoccupation with height in their French counterparts. And there are striking examples of originality at Toledo, as in the Islamic decoration of the triforium arcades above the nave. The cathedrals of Toledo and Burgos were ongoing projects that outlasted the lifetimes of their founders and original architects: only León (ca. 1255–1300) achieves a homogeneity and suggests a closer relationship with a specific French Gothic model in plan, elevation, and proportions (Reims).

In the fourteenth century, building activity flourished in the Crown of Aragón, due in part to the kingdom's commercial interests in Mediterranean trade. The cathedral of Barcelona (begun 1298) rivals in size and follows in general disposition contemporary examples of Gothic architecture in southern French cities such as Narbonne, Toulouse, and Limoges. A three-aisled basilica more than 100 meters in length, the interior of the cathedral is dominated by a tall and wide nave arcade that opens the view and circulation to the narrow aisles. This unifying tendency in interior space occurs as well in other Catalan churches, such as the cathedral of Mallorca (begun circa 1320), whose nave reached a width of almost 20 meters and a vault height of 40 meters.

Despite constant political turmoil and civil disturbances in the fifteenth century, grandiose architectural projects, such as the cathedrals of Seville and the nave of the cathedral of Girona, were continued or undertaken. Progress was often slow, involving a succession of architects both native and foreign, and energies were often directed more toward luxurious decoration and overwhelming size than innovations in design or structure. More manageable projects amid these periods of civil unrest were privately sponsored family tombs or chapels, built as independent structures or incorporated into the design of existing churches, usually as chapels entered from the aisles.

The cathedral of Seville is 145 meters long and 76 meters wide, with a height of more than 40 meters in the vaults of the ambulatory surrounding the apse. Construction began in 1402 but was not completed until a century later in 1519. During that time a number of architects were employed, including masters of Flemish and English origin. The influence, also seen in painting, manuscript illumination, and sculpture, and part of the rich decorative style known as “internal

thional Gothic,” is apparent in the flamboyant carving of the moldings in the triforium openings and the starlike patterns of the vaults at Seville. Despite the preponderance of artisans from northern Europe, the team of craftsmen at the royally founded Franciscan monastery of San Juan de los Reyes in Toledo (ca. 1490–1500) also included at least two mudéjares, responsible for some of the most ornately carved surface decoration in the ensemble: their inclusion exemplifies the continued influence of Islamic traditions in the art of the later Middle Ages in Spain.

The Gothic style persisted in Spain well into the sixteenth century, with the building of the cathedrals of Salamanca, Segovia, and Zaragoza. At Salamanca the vocabulary and plan continue the legacy of early Gothic structures in the peninsula while the tall proportions and narrower nave virtually eliminate and deny any sense of weight or mass.

Military Architecture

Long centuries of armed conflicts arising from conquest, reconquest, and civil war resulted in numerous fortified structures throughout Iberia during the Middle Ages. Whether in ruins or restored form, castles and walls remain a significant part of the Iberian landscape.

In addition to the natural protection offered by rivers, mountains, and other natural barriers, many villages and cities were dominated by their castles or surrounded by heavily fortified walls. Due to their strategic location, fortifications often have a continuous history of building stretching from Roman settlement to Arab conquest to Christian reconquest and further rebuilding in the later middle ages.

13th century AD. City walls. 12th–13th c. Copyright © Giraudon/Art Resource, NY Avila, Spain.

Cities such as León and Mérida were fortified with walls in Roman times, parts of which remained and were augmented and strengthened in the Middle Ages. The most common building material in these examples was roughly cut stone of varying shapes and sizes, reinforced with square, polygonal, or round towers and interrupted by gateways. The Puerta de Bisagra (antigua) in Toledo is a tenth century gateway, primarily a Muslim construction with horseshoe arch, flanking square towers, large, heavily rusticated stones, and an imposing monolithic lintel. The crenellated superstructure of this gateway, however, was rebuilt in the later twelfth or thirteenth centuries long after the Christian reconquest of the city in 1085. Here the material employed is brick and mampostería (a mixture of stone and rubble). Another material used for walls and favored by the Muslims is tapia, a mortar held in place by wooden forms until dry. This material is still visible in the remains of the castles of Monteagudo in Murcia and Alcalá de Guadaira southeast of Seville. Later gateways, such as the Puerta de Cuarte in Valencia from the mid-fifteenth century, feature stone construction and strongly projecting cylindrical towers.

Other cities in Medieval Spain built their walls as the Reconquest extended Christian frontiers toward the south. Avila's walls in New Castile, reinforced with eighty-eight towers, were originally built sometime after 1090; those surrounding the cities of Daroca in southern Aragón and Santo Domingo de la Calzada (Castile) were erected sometime in the fourteenth century.

Castle plans vary according to site and the technology of siege and defense, but standard elements are walls, keep (*torre de homenaje*), and ward. Walls are reinforced with towers of varying shapes, capped with crenellations (merlons and embrasures) and sometimes outfitted with machicolations, portions of projecting wall supported by corbels through which pitch could be poured on would-be attackers. Behind the walls was a walkway, parts of which could be dismantled to isolate the keep. Walls were interrupted by gateways and posterns, small doorways usually hidden from direct view. Arrow slits were usually located in the towers: as a consequence of effective firearms in the fifteenth century, walls were built lower but more solidly to resist siege by cannon rather than by scaling. The keep was the noble residence and final line of the castle's defense. Recognizable by its great height (112 feet at Peñafiel in León), the keep was usually square and connected to the wall, but in some examples is located outside the walls (*torre de albarrana*) and accessible by a walkway. Until the fifteenth century the quarters of the keep were generally modest and not well lit, but in later examples they were embellished with decoration

and amenities. Ceilings were vaulted rather than covered with timber to prevent entry from above. During the Reconquest, castles usually included chapels and churches for monks or members of military orders. Inside the walls the ward contained stables, living quarters for knights, cisterns, and storage areas for provisions. Many castles were fortified by outer (curtain) walls as well as dry moats to further stifle a siege.

In Spain as well as throughout western Europe, Christian castles built in stone were rare before the later twelfth century. After this time stone castles not only became more plentiful but also were built rapidly and at great expense. One striking early stone example is the castle/monastery of Loarre near Jaca in northern Aragón, a natural stronghold built in the later eleventh and twelfth centuries on a steep mountainous site. Its outer walls are articulated with round towers while the keep and church are protected by inner walls with square towers. The plan is irregular and compact with smoother stone and more sophisticated construction used for the basilican church within.

Zorita de los Canes, on the Tagus River near Guadalajara, is one of a few remaining castles built in the later twelfth and thirteenth centuries by the Order of Calatrava to protect the vast territories occupied during this active period of Reconquest. Originally a Muslim *alcazaba*, Zorita's expansive plan and extramural tower (*torre de albarrana*) parallel the large and complex forms of castles built in the Holy Land during the Crusades such as Krak des Chevaliers.

A number of later castles, like the well-preserved Torrelobatón near Valladolid, are square in plan, with three rounded corner towers and the fourth occupied by a tall square keep with sentry towers at its corners. Although built upon earlier foundations, Torrelobatón dates in its present form to the mid-fifteenth century and served as a stronghold for noble families vying for political power with the Castilian crown. The compact plan follows a general tendency throughout Europe during the fourteenth and fifteenth centuries.

Later castles, like Olite in Navarre (built by the French-born king Charles III) or Coca, near Segovia in Castile, were more luxurious in decoration and accommodations. Coca is essentially built of brick and mampostería, with full exploitation of textural variety and relief patterns, while Olite employs Gothic-inspired stone construction with pointed arches and elegant proportions. Both have irregular plans, spacious living quarters, and patios. They served the dual purposes of defense and residence, and their form is dictated both by a desire for comfort and entertainment as well as protection.

ARIANISM See CHURCH; HERESY; THEOLOGY

ARIAS DÁVILA FAMILY

The Arias Dávilas were an important dynasty of *converso* officials in fifteenth-century Castile. Diego Arias Dávila (d. 1466), who before his conversion to Christianity was named Ysaque (Isaac) Abenácar of Ávila, was apparently in Segovia where he converted during the preaching campaign of Vicente Ferrer in 1411 (when nearly the entire Jewish community was baptized). Shortly after his conversion he was known as Diego Bolante, or Volador, and he later became a protégé of Enrique IV (reigned 1454–1474). He married Juana Rodríguez (undoubtedly also a convert), who apparently died soon after, and then Elvira González of Ávila, also of Jewish background. As *contador mayor* of the kingdom (in charge of the finances), he was one of the most despised men in the realm. His considerable property was inherited by his two sons and one daughter.

His older son, Pedro, held the position of *contador mayor* after his father's death. Juan, the other son (ca. 1430–1497), became bishop of Segovia. Enemies of Pedro convinced Enrique, falsely, of Pedro's "treason," for which the king had him imprisoned. He was severely wounded while in prison. He was married to María Ortiz Cota, of an illustrious *converso* family; they had five sons and two daughters.

Pedro died during the siege of Madrid in 1476, and his eldest son, Diego, inherited the position of *con-*

tador mayor. Diego also was named lord of Puñonrostro, lands created by his grandfather Diego. He married Marina de Mendoza, the illegitimate daughter of the *marqués* de Santillana (Íñigo López de Mendoza). Diego died about 1482. His brother Juan was the first count of Puñonrostro.

The most important member of this family, however, was another son of Pedro, Pedrarias (Pedro Arias) Dávila, born probably about 1440. He was known as the *gran justador*, an accomplished soldier who headed the forces of Segovia and Toledo in the conquest of Oran (in North Africa) in 1509. He also apparently participated in the conquest of Granada for Fernando and Isabel. In 1513 they sent him to "discover" and govern the "Tierra Firme" in the New World, recently discovered by Balboa but not effectively explored. He became the governor of Nicaragua and established the colony of Panama. Pedrarias married Isabel de Boabadilla y Peñalosa, granddaughter of the famous *marquesa* de Moya, an intimate of Queen Isabel. One of their daughters, María de Peñalosa, was promised in marriage to Balboa, but instead married Rodrigo de Contreras, also a governor of Nicaragua. Another daughter, Isabel, married the famous explorer Hernando de Soto.

A purported "blood libel" case in Segovia in 1468 (if it ever happened) involved charges that some Jews had captured and tortured a Christian boy in nearby Sepúlveda. Juan Arias Dávila, the bishop of Segovia, ordered the arrest of sixteen Jews supposedly guilty of this crime. However, according to one source, the bishop himself came under attack and was compelled to go to Rome to defend himself. The motive for this attack on the otherwise respected bishop (who gave both an important library and a hospital to his city) was no doubt due to the revenge he took for the unjust charges against, and imprisonment of, his brother Pedro. The bishop plotted to seize Segovia and turn it over to the rebel forces that supported Alfonso, his half brother. In Rome the bishop had to renounce his authority over the diocese, and he remained in Rome until his death in 1497. The bishop, his deceased father, his mother, and other members of the family were later accused of heresy by the Inquisition.

ARIAS, MAYOR

Mayor Arias was the wife of Ruy González de Clavijo, who was sent by Enrique III (1390–1406) on an embassy to Tamburlaine (Timur) in 1403 and afterward wrote an account of the expedition, the *Embajada a Tamorlán* (1943). She is also the author of the earliest Castilian poem that can be attributed to a woman. A manuscript miscellany in the Bibliothèque Nationale in Paris contains an exchange of poems between Mayor Arias and Ruy González, apparently written on the occasion of his voyage. Mayor Arias's thirteen-stanza poem, which carries the misleading rubric "Dezir de otro mensagero . . ." ("Poem of Another Messenger"), consists of an address to the sea pleading for the safe passage and return of her husband. The second is a simple, shorter poem of farewell from the husband to the wife, again with an unhelpful rubric. "Ay mar braba esquiba" ("Oh Fierce Cruel Sea") is by far the superior poem and, incidentally, of considerable historical and literary interest. The four-line *estribillo*, or refrain, allows us to identify it as a *contrafactum*, a remodeling, of an old song, "Alta mar esquivá," which is known, albeit imperfectly, from three later versions. The theme of a woman's complaint to the sea for carrying off her beloved at the behest of a king represents the earliest Castilian link with the *cantiga de amigo* (woman's song) of Galician-Portuguese tradition. As such it seems to provide unique evidence of continuity between the two main branches of Iberian lyric, otherwise undocumented during the Late Middle Ages. Whether or not Mayor Arias wrote it herself has to remain an open question. But precisely those features that distinguish it from the conventional court lyric of the period—the personal touches, vigorous language, positive outlook—constitute strong indications that it was composed by someone who did not feel bound by conventions: therefore, quite possibly, a woman.

ARMY, CASTILIAN, CATALAN, MUSLIM, PORTUGUESE

Military forces underwent a remarkable evolution during the Middle Ages in the Iberian Peninsula. Starting

with a fully professional army of long-term legionaries and auxiliaries that typify the Imperial Era, a series of invasions substantially altered the governmental systems and the armed forces they raised. The first of these incursions produced the Visigothic Kingdom, which was in the process of evolving from a migratory tribal kingship to an early form of territorial monarchy. Prior to the composition of the various codes of law promulgated by the Visigoths in Spain, we know little of their military organization beyond the fact that it consisted of tribal levies, assembled to fight under the king or leader designated by him. The system was apparently effective, capable of defeating a professional Roman army under Valens at Adrianople in 378. It proved sufficient over time to carry the Visigoths into the peninsula and defeat all of their adversaries there. Maintaining its primitive vigor was another story. By the sixth century, the Visigothic Code describes a military force raised by levies from each *civitas*, the old local Roman unit of government often converted into a county and placed under a Gothic *comes*, or count. These county levies were called *tiufa* and led by a *tiufadus*, the military count in command for military engagements, but occasionally subordinate to the city count in the event of any misconduct. Theoretically each *tiufa* numbered a thousand men, but it was levied primarily from the Visigothic populace, with only a small number of Hispano-Romans recruited. Therefore, the Goths raised such levies only where they had active garrisons and population settlements in Spain. The *hostis* or *expeditio* provided the occasion for the largest military levy, and all garrison commanders along with nobles sworn to the king were enjoined to assemble their retinues, including even 10 percent of their slaves, in order to serve the royal need. Their armies consisted of both infantry and cavalry, but we have no adequate information regarding their relative proportion or comparative employment in battle. The major military reform law ordered by King Wamba in 673 indicates that the military establishment had become a problem by the seventh century. The numerous punishments meted out for failure to appear for service or for desertion clearly point to a growing deficiency in the Gothic monarchy, whose ability to maintain order and defend the realm was absolutely central to its continued existence. Even after Wamba's enemies overthrew him, they continually endeavored to enforce modified forms of his military laws. However, the Goths seem never to have fully integrated the military structures into the Hispano-Roman society as a whole, a key to their collapse in the face of the Muslim invasion of 711–715.

The Islamic invasion brought combined armies of both Arabic and Berber North Africans into Spain. It

was a Berber army under its chieftain Tāriq that achieved the initial victory at the Guadalete River in 711, while demonstrating its ability to operate independently. An Arab force joined them in 712, the combined troops subsequently routing all of the Visigothic garrisons in the Iberian Peninsula within four years. Again, little is known of the nature of Muslim military forces at this point, save that they were fired by the words of the prophet Muḥammad and possessed a conviction the Goths could not match in combat. Once ʿAbd al-Raḥmān I, last of the Umayyad dynasty that fled from Damascus in 750, crossed into Spain and began to organize a centralized emirate based in Córdoba, the outlines of a more formal military establishment began to take shape in the emerging state of unified Muslim Spain called al-Andalus. In addition to a succession of able emirs (after 929 known as caliphs), the real staying power of this empire lay in the bureaucratized state system evolved by these enterprising monarchs. Through the superior taxing system they introduced, the emir-caliphs maintained both a small standing force in Córdoba, along with a regional organization based in the local administrative units known as the *kūras*. These forces were placed under a vizier who took general charge of the military forces, yielding them to the monarch or his chief executive office, the *ḥājib*, when required. The *kūras* were often laid out along the lines of the former Roman civitates and Gothic counties. In these *kūras*, entire tribal or clannic groups called *junds* had been settled, and from the *junds* the local levies were raised and placed under the command of the royal officer or captain called the *alcaide*, directly responsible to the emir-caliph.

Down to the tenth century, al-Andalus fielded a centralized army from the *kūras* owing allegiance directly to the monarch. Against the emerging Christian states to the north, the caliphs organized frontier marches, an Upper March commanded from Zaragoza, a Middle March centered in Toledo, and a Lower March based in Mérida. As long as this system operated effectively under an able monarch, the armies of the Christian territories were no match for it in the field. Nevertheless, ʿAbd al-Raḥmān III shifted the basis for army recruitment in the mid-tenth century, depending increasingly on imported Slavic and Berber troops, less on the *junds* in the *kūras*. His successor in control of the military, the capable *ḥājib* general Al-Manṣūr, intensified these methods, placing decreasing dependence on the native *kūra* levies. While such personnel offered Al-Manṣūr exceptional loyalty, enabling him to pursue many devastating campaigns deep into the Christian states with impunity, the system deteriorated under his successors. When the caliphate broke up into the smaller *ṭāʾifa* kingdoms after 1031,

the overall effectiveness of the Muslim military establishment declined in the face of Islamic disunity. Increasingly the *taifa* states required the infusions of North African Berber reinforcements to stand up to the aggressive expansionism of the Christian north. This came at a time when these emerging states were forging armies and pressing fortified settlements well south of the Duero River.

While encased in the Cantabrian Mountains of the north, the nascent state of Asturias had need of a military force to control the lands on its flanks, especially Galicia and the northern fringes of Castile. Fortifications, garrisons, and raiding parties covered the basic concerns of offense and defense required to protect the state in this excellent defensive terrain. However, when the Asturian kings expanded onto the Meseta plateau and transformed Asturias into the Kingdom of León through the capture of that city in the tenth century, the entire picture changed. Both pressed against and threatened by the Middle and Lower Marches of the Caliphate, the stimulus to enhance the military capacity of the Leonese state became intense. The Asturo-Leonese monarchy recruited its traditional military forces from its magnates, who in turn gathered their forces from their retainers and bodyguards. As was true of much of the remainder of Europe at this time, an emphasis on mounted service was clearly present. Limited by economics and primitive state development to a comparatively small force, warriors on horseback covered a maximum of territory in a minimum amount of time, and were especially useful for lightning strikes and booty-gathering forays. The mounted aristocracy had foot soldiers among their retainers, who certainly made up the large majority of the forces for any extended campaign not exclusively intended as a raid. Certainly the movement onto the Meseta Plain opened the door to larger land holdings for the king, his nobility, and the Church, all of whom fielded military forces in time of need. Land revenues combined with enhanced booty opportunities enlarged the financial base necessary for expanded military needs. The royal tax base grew, especially given the ability to summon military expeditions (*fossato*, *fonsado*), and collecting fees (*fossataria*, *fonsadera*) from those who did not serve. But here seems to lie two important keys to the success of the Christian Reconquest. First, the Northerners' ability to settle in force in the open lands of the Duero Valley was neither matched nor resisted by an equal capability on the part of the Muslims. Second, at a time when the caliphate increasingly resorted to outside forces while cutting back on domestic recruiting from the *kūras*, the Leonese state began to consider methods for raising a larger military force from among the settlers on the Duero frontier.

There exists considerable debate among historians as to the degree we can trust the later tenth- and eleventh-century documents, but it would appear that this era began to produce the types of settlements we can describe as towns of a rudimentary sort. These fortified settlements begin to offer the possibility of military service, the first important statement of which is contained in the *Fuero de León* (1017–1020), a municipal charter that influenced a number of others in the eleventh century. From this beginning, the municipal settlements beginning to multiply both north and south of the Duero River increasingly found a military service obligation included in their settlement charters (*fueros*). Their obligation more often took the form of defense (*apellido*) rather than offense (*fonsado*), and was restricted in time and to their immediate locality in the later eleventh and early twelfth centuries. They nevertheless offered regional security and relieved the king of the total responsibility of their protection. This situation enabled Fernando I and Alfonso VI to add territories and tax revenues, equipping a larger army by the distribution of lands to a growing aristocracy. The kings also exploited the situation to bully the *tāʾifa* princes into granting them annual tributes (*parias*) that served to expand the Christian warmaking ability still further.

Weakened by all of these factors, the central Meseta town of Toledo fell to the Christians in 1085, compelling the *tāʾifa* states to resort to the older tenth-century practice of securing reinforcement from North Africa. The Almoravid Berbers responded with an expeditionary force that defeated the army of Alfonso VI at Zallāqah in 1086. For the Muslims, the older policy of relying on outside aid did not constitute a simple return to the circumstances of the tenth century. These Berber armies brought a new political and religious system in their wake, one that threatened to unify the Iberian Islamic states in the hands of often puritanical and unpopular outsiders. The recruitment of North African reserves also threatened the advantage gained by León-Castile earlier in the eleventh century, although these large-scale reinforcements would always be sporadic during the following decades. To deal with the possibility of this threat, the Leonese monarchy also called upon outside aid from France, especially, but here too support was occasional and particular to special campaigns. The Crusade movement in the Near East, ironically encouraged by the success of the Hispanic Reconquest, began to drain such forces away by the early twelfth century. It became clear that the Leonese-Castilian military machine must be geared to deal both with the *tāʾifa* states and the North African campaigning forces if it hoped to continue its expansionist pressure on the central Meseta. The problem

was made no easier when the expansion generated during the reign of Alfonso VII (1126–1157) produced yet another reformist invasion, that of the Almohads after 1150.

With population resources available for settlement growing tighter, and the monarchy splitting into a separate León and Castile in 1157, creative skills in military recruitment reached a decisive point and took the form of two major responses. The first was gradually to encourage the settlement of larger towns by offering greater personal freedoms, while slowly expanding the reach of their militias. These town militias had played no role in distant campaigns in the south during the eleventh century, such as Alfonso VI's campaign against the Almoravids at Zallāqah. By the end of the twelfth century, they would be capable of campaigning for a month or longer with a striking range of two hundred miles or more, unparalleled for town forces at the time in Europe. Secondly, a new hybrid of monastic and military life, the military order, migrated from its place of origin in the Crusader Near East to appear on the Reconquest frontier in Iberia. Ideal for the garrisoning of castles and for initiating quick-striking raids (*cabalgadas*, *algaras*), the military orders could also enhance the campaigning forces of the king along with the municipal militias. The Templars and Hospitallers had appeared earlier in the twelfth century in Aragón, but the Leonese and Castilian states would generate their own domestic versions, starting with the Order of Calatrava (1158), followed by the Order of Santiago (1170) and the Order of Alcántara (1176), these being the most important among several others. While these forces were insufficient to avert the defeat of King Alfonso VIII at Alarcos in 1195 at the hands of the Almohads, their fuller combination at Las Navas de Tolosa in 1212 proved ample for the same king to win a decisive battle that turned the course of the Reconquest, in the face of both the Andalusian levies and expeditionary forces from Almohad North Africa.

The evolution of the Portuguese army followed a track similar to that of León-Castile. As the kingdom secured its independence in the 1140s under King Afonso I Henriques, serious military threats loomed to the east from Alfonso VII and the Leonese monarchy, and to the south, where the Almohad revival threatened from across the Tejo River. Afonso's greatest achievement, the capture of Lisbon in 1147, had only been accomplished with the assistance of troops from England and the Netherlands en route to the Second Crusade. But Portugal would respond to the stresses of the later twelfth century with an inventiveness equal to that of its Christian neighbors. The concept of military orders soon crossed to Portugal. The Templars arrived in the later twelfth century, and a

domestic version appeared with the foundation of the Order of Évora in 1166, soon renamed the Order of Avis in 1211. The expanded role of the municipal militias to supplement the levies of aristocracy and church emerges in the kingdom, as well. The Portuguese municipal *forais* (analogous to the Castilian *fueros*) suggest the development of two kinds of charter pattern. The northern pattern, based on the charter of Trancoso, sought a defense of the frontiers against León, limiting the offensive range of the militia by a brief three-day span of service. To the south and east, charters patterned after the *forais* of Évora and Santarém were granted to the frontier towns, designed to enhance knightly forces in the expedition and to be able to reach into Leonese Extremadura and Andalusia in service time. In no case, however, do the Portuguese *forais* suggest the creation of municipal militias with the operating range and the month or more fighting time span known in León-Castile. Portugal possessed neither the vast territories of its eastern neighbor nor (after the mid-thirteenth century) a frontier against Granada that would have encouraged the monarchy to require an expeditionary capacity from its municipalities.

The military situation in the Crown of Aragón was somewhat more complex. The two political entities that came to make up the crown, the Crown of Aragón and the County of Barcelona, existed separately until the dynastic marriage of Petronilla of Aragón and Ramón Berenguer IV of Barcelona in 1137. The Crown of Aragón evolved a military system similar to that of Castile, including the development of municipal militias with an expeditionary capability. Domestic military orders gained no foothold here, but the Templars and the Hospitallers were very active. Feudal practices to secure a well-armed mounted force appear in all of the peninsular kingdoms, but were especially well-developed in Aragón, including a willingness to permit hereditary possession of fiefs, a practice not common in Castile. In the County of Barcelona, towns offered military levies to the count, but their militias did not indicate the long-range capabilities of those of the Reino de Aragón or of Castile. As was the case in Portugal, the territorial expansion was rather less extensive, and the counts were able to achieve their expansion with an army more centered on mounted feudal nobles. Alfonso II (Alfons I in Barcelona) was the first king to exploit the military establishment of both reino and county. With his Aragónese resources, Alfonso moved south to take Teruel, while his comital forces enabled him to pursue his claims in southern France. After the trans-Pyrenean zone was closed by the disaster at Muret in 1213, the monarchy turned its attention toward the south and the *ṭāʿifa* of Valencia, and to the east toward the Balearic Islands. King Jaime

I expertly combined his Catalan and Aragónese forces for the conquest of Mallorca and the assault on Valencia. Town forces from Lleida, Tarragona, and Barcelona, along with outstanding contributions from the Catalan nobles such as the Moncadas, accomplished the overseas conquest of the former, while the Aragónese nobility and the militias of Teruel and Zaragoza combined effectively in the latter campaign.

The victory attained at Las Navas de Tolosa in 1212 demonstrates the manner in which both Muslim and Hispanic Christian forces operated in combat in the thirteenth century. The Muslim army was a composite of both peninsular units and an Almohad expeditionary force from North Africa. The Christian army possessed contingents from Castile, Aragón, and Navarre, each led by the kings of their countries. French units had participated early in the campaign, but departed before the climactic confrontation in Andalusia. Having found a way to penetrate the Sierra Morena mountains, Alfonso VIII descended into the southern foothills on the Islamic flank. Muḥammad al-Naṣir, the Almohad king, promptly regrouped his forces at Navas de Tolosa, setting the stage for the grand conflict on 16 July. Both sides utilized a conventional arrangement of their troops along a line with a center and two wings, backed by a reserve force to be unleashed at the critical moment. The Muslims, who possessed the larger force, also added a line of light skirmishers at the front. On the opposing side, the Aragónese under Pedro II held the Christian right, the Navarrese under Sancho VII held the left, and the center disposed itself in triple layers, with a vanguard, the main body, and Alfonso himself directing the reserve. The Christian forces consisted of the royal standing army, the various aristocrats of the realm with their levies, the military orders of Calatrava and Santiago, and cavalry and foot soldiers of the municipal militias, of which Avila, Segovia, Medina del Campo and Toledo were specifically mentioned in the chronicles (with indications of many more townsmen mixed among the various components). The Almohad line of skirmishers, formed of arrow slingers and javelin hurlers, advanced toward the Christian vanguard, which responded to this provocation by rushing and scattering their tormentors on the way to attacking the Muslim center. The left, center, and right of each side promptly joined the conflict. As the struggle progressed, the Christians began to force the Muslims backward. Then Al-Naṣir dispatched a large portion of his reserve to brace the Muslim lines. In reaction to this, the Christian lines began to buckle, and a number of soldiers fled. Alfonso committed his reserve, including his best cavalry, to bring the infantry back into line, causing the momentum to swing back to the Christian army. Slowly the Muslim

lines eroded, but the real breakthrough occurred when a part of the Christian army, probably the Navarrese left under King Sancho, penetrated to Al-Naṣir's camp and attacked his chained African guards. The Almohad caliph fled in panic on horseback, provoking his forces to break into flight. The battle had been comparatively even to this point, but the Andalusian, Berber, and Arabic forces exposed themselves to wholesale slaughter by a disorganized retreat. Only the Christians' pause to sack the Muslim camp slowed the general progress of the rout, but the carnage mounted steadily. The pursuit persisted until twilight forced a halt. The battle signaled the state of advance of Christian peninsular armies, evolved to a state of maturity that would henceforth never permit Muslims forces to win a major field conflict in the Reconquest.

The Later Middle Ages witnessed a slow evolution in the basic composition of the military establishment in Portugal, Castile, and Aragón. The monarchs of each kingdom sought at various times to restrain the development of the bellicose institutions that had advanced the Reconquest: the nobility, the military orders, and the towns. Both the orders and the municipal militias had developed less formidably in Portugal and the Crown of Aragón, but periodic social unrest between landlord and peasant and among the various classes in the towns gave these kings a continuing need for military forces. In Castile, towns and military orders had a major part in the politics of the fourteenth and fifteenth centuries. A frontier with Granada continued to exist. The armed nobility had divided into an upper stratum of *grandes*, *hidalgos*, and *caballeros de linaje*, who tended to ride in a long-stirrup, stiff-legged style that favored charges and contact with their enemies, while the lesser *caballeros* and *jinetes* favored speed and maneuver with a short-stirrup, bent-knee style. Some of these last two categories served with the towns, which formed into leagues (*hermandades*). Such forces threatened the royal efforts to consolidate national monarchies. In all three Christian kingdoms, kings sought to build independent military forces through the payment of money in lieu of service, using these revenues to pay for a growing standing army. Civil wars and succession crises delayed these endeavors until well into the Trastámara age. It would then be left to the Catholic Kings to bring these reforms to fruition, generating from the militarized heritage of the Reconquest and the organizational skills of Renaissance despotism the armies that would march across Europe and the New World in the sixteenth century. However, this society organized for war continued through its traditions to threaten even the Hapsburg monarch Carlos V in the Comunero Revolt and the Germanía of Valencia from 1519 to 1521.

ART See ARCHITECTURE; ART, JEWISH; ART, MUSLIM; MANUSCRIPT ILLUMINATION; SCULPTURE, GOTHIC, PORTUGUESE

ART, JEWISH

Jews have always practiced various forms of artistic expression, from biblical times to the present, in spite of the incorrect assumption that the second of the Ten Commandments prohibits art (it doesn't; it prohibits worship of images). It is known that there were mutual influences between the architecture and art of the Jews and of all peoples with whom they came in contact, including the early Greeks. Jewish art also had a direct and observable influence on early Christian art. From the medieval period the most frequent, and certainly best-known, form of Jewish art that has survived is manuscript illumination.

Illuminated Manuscripts

The earliest extant examples of illuminated Hebrew manuscripts come from Muslim lands, and no doubt this form of art was also practiced by Jews in Muslim Spain, though none has survived. Under Muslim influence the carpet page form of illumination evolved, full-page designs of intricate geometric or fol-

iate patterns imitating the style of a carpet like those used in mosques and in synagogues. The most famous example from Spain comes from the Christian period, the *Damascus Keter* (Burgos, 1260), which has fourteen such pages. Also typical are the outlines of the forms done in micrographic script (minute Hebrew lettering). This manuscript probably was imitated in the Parma Bible (fourteenth century). Another interesting example is in the Lisbon Bible (1483). Far more important are the numerous elaborate carpet pages of the First Kennicott Bible (La Coruña, 1476), which also used as a model the Mudéjar style of carved wooden ceiling found in such structures as the Church of Santa Cruz in Toledo and the Alhambra (apparently authorities have not hitherto realized this source).

Whereas Castilian illumination drew heavily on Muslim as well as contemporary Christian influences, the numerous illuminated manuscripts of Aragón-Catalonia were inspired exclusively by the Gothic school of Provence and France, and later by the Italian school that dominated Catalan art of the fourteenth century. An important example of the latter is the Copenhagen *Moreh nevukhim* (1348) and its obvious relation to the Master of St. Mark. Another example, not hitherto noticed, is the borrowing of decorative elements (foliate designs, birds, flowers) in the Barcelona *Haggadah* from the Barcelona *Llibre verde* of the same period.

Hebrew manuscript illumination appears to have come to a virtual halt with the destruction of many communities in 1391, but strongly reemerged with new traditions in the fifteenth century, in places as far removed as La Coruña and Seville, but the main activity was in Portugal, where Bibles, prayer books, and at least one richly illuminated manuscript of Maimonides' *Mishneh Torah* were produced. These are profusely illuminated, in some cases every page, in a variety of rich colors and designs and with liberal use of gold.

In addition to the carpet pages and illuminations of scenes, Spanish Hebrew Bible manuscripts are unique for the illustration of Temple cult objects and vessels (the menorah, etc.), with many full-page illuminations. It has been demonstrated by Gutmann and others that these reflected a longing for the messianic return to Palestine and the rebuilding of the Temple. This was not a longing unique to Spanish Jews, but its symbolic portrayal in such illuminations is unique.

The most important illuminated Bibles are the Damascus *Keter* (Burgos, 1260), the Cervera Bible (Toledo?, 1300; of special importance is the magnificent full-page stylized menorah flanked by olive trees, in subtle blues and gold and strikingly "modern" in design), the Second Kennicott Bible (Soria, 1306), the

Oxford Ibn Gaon Bible (Soria, ca. 1300), the Perpignan Bible (1299; Paris, Bibliothèque National, Ms. hébr. 7—the earliest to illustrate the cult utensils), the Parma Bible (Catalan, fourteenth century), the Duke of Sussex Bible (Catalan, fourteenth century), the King's Bible (Solsona, 1384), the Farhi Bible (1366–1382; richly illuminated, it took seventeen years to complete!), the First Kennicott Bible (La Coruña, 1476), and the various Portuguese Bibles of the fifteenth century.

In addition to their obvious importance for Jewish history, these volumes contain many details that are of interest for general Spanish history (coats of arms, illustrations of buildings, portraits of kings, soldiers, etc.). All of these deserve study.

Next in importance to Bibles are Passover *haggadot* (orders of the Passover meal and service), which usually are even more richly illuminated than Bibles, and also contain material of great historical interest. The rare Castilian (so-called Moresque) *Haggadah* (ca. 1300) should be pointed out, particularly for what may be a portrait of the king and for its architectural details, as should the famous Golden *Haggadah* (Barcelona, ca. 1300; available in facsimile edition), another mid-fourteenth-century Barcelona *Haggadah*, the magnificent Sarajevo *Haggadah*, the Kaufmann *Haggadah* (certainly not French or Italian, as has been argued; it has the coats of arms of León, Castile, and Aragón!). Both the Golden and Sarajevo *Haggadahs* have been published, as well as others.

Other illuminated Spanish manuscripts include the Oxford Catalan Maimonides (*Guide*) (Hebrew translation, fourteenth century); the Lisbon Maimonides (*Mishneh Torah*) (1472); the previously mentioned Copenhagen *Moreh* (*Guide*), unique for its important picture of a Jewish astronomer lecturing students; and various prayer books and other legal and philosophical works.

Other Artistic Forms

Jewish rings and seals existed from very early times (a ring was discovered in the Montjuich cemetery excavations in Barcelona), and were prevalent in Spain. The most sensational discovery purports to be the ring of Nahmanides, found at Acco in Israel, but the most famous and artistically important is that of Todros Abulafia, presumed to be the son of the famous Samuel ha-Levi, treasurer of Pedro I and builder of the El Tránsito synagogue of Toledo. The seal indeed reproduces the quatrefoil design, with a castle in the center, found over the window of that synagogue. The fleur-de-lis decoration is found also on other Jewish seals. Other seals include that of the Jewish community

of Seville, various Passover seals for certifying unleavened bread, and signet rings.

Synagogue architecture is another artistic form. Important miscellaneous items include the famous key presented by the Jews of Seville to Fernando III (1248), with its Hebrew and Spanish lettering praising the king in the biblical language normally used for God, and an important picture of a ship, and the elaborate Hebrew eulogy and symbols of León and Castile on the same king's tomb in Seville.

Of interest is a unique Passover plate produced in Spain (Valencia, and specifically Manises, has been suggested) that may or may not have been done by a Jewish craftsman (the errors in the simple Hebrew words can easily be explained in view of many similar examples). It is of typical Majolican design, elegant but unremarkable save as an indication that undoubtedly other such plates once existed.

The subject of some debate is the Berlin rug that has been identified as a synagogue carpet (fourteenth century) with a design that, it is claimed (likely wrongly), represents a menorah, and with several stylized images of either a Torah ark or possibly the Temple. In any event we know of the existence of such rugs in synagogues, used as wall covers or even ark covers, from Jewish sources.

The names of various Jewish and/or *converso* artists of the fifteenth century (best known are Juan and Guillen de Levi) have survived. Jews did do work for Christians on cult objects and even prayer books. The fame of Jews as goldsmiths, jewelers, and dyers of fabrics is attested in numerous sources, particularly their employment by kings and the royal families.

ART, MUSLIM

For medieval Iberia, the term *Islamic art* refers to the arts made between the eighth century and the end of the fifteenth for Muslim patrons in the parts of the Iberian Peninsula where Islam was the religion of the rulers. Two other terms are also used to refer to related arts in the region. *Mozarabic*, from the Arabic *musta'rab* (Arabized), refers to the art of Christians living under Muslim domination, particularly in the tenth and

eleventh centuries, and *Mudéjar*, from the Arabic *mu-dajjan* (permitted to remain), refers to the art of Muslims living under Christian rule from the eleventh through the fifteenth centuries. Although important works of art were produced throughout the nearly eight centuries of Muslim rule in the region, the two greatest periods of Islamic art are the tenth century at the Umayyad court at Córdoba and the thirteenth and fourteenth centuries at the Naşrid court at Granada. In both periods, magnificent buildings—mosques, palaces, and citadels—were erected and furnished with fine silks, beautiful books, intricately carved objects of wood and ivory, precious metalwares, and glazed ceramics.

Al-Andalus, as the Islamic lands of medieval Iberia were known, entered into commercial and diplomatic relations with contemporary Muslim and Christian powers, but the relative geographical isolation of the region from artistic centers in the eastern Islamic lands gave its art a distinctively local character from an early date, as artists consequently looked back on and reinterpreted past achievements. The luxury and inventiveness of the Islamic arts of medieval Iberia gave them enormous prestige in the neighboring Muslim lands of northwest Africa as well as in the Christian kingdoms of Iberia. The value in which Islamic decorative arts were held by contemporary Christians is shown by the many examples preserved in church treasuries where they were often used to wrap and contain relics, regardless of the presence of Arabic inscriptions invoking God's blessing on a particular Muslim figure.

As elsewhere in the Islamic lands, architecture was the earliest and most important form of Islamic art in the peninsula, for the new Muslim community needed to have a congregational mosque in each town for communal prayer on Friday noon. Of these congregational mosques, the oldest and most important is that of Córdoba, begun in 786 and repeatedly embellished and enlarged. Like contemporary mosques elsewhere, this building consisted of a walled courtyard leading to a prayer hall in which the roof was supported by many columns. Assembled largely from materials taken from earlier buildings, the first mosque was distinguished by its unique solution for achieving the necessary height: two tiers of short columns were superposed and stabilized by arches assembled from red bricks and blocks of white stone. In subsequent enlargements during the ninth and tenth centuries—which graphically show the numerical growth of the Muslim community—such innovations as the two-tiered system of supports and the horseshoe shape and alternating materials of the arches were maintained. The mosque's square minaret (erected in 951 and later encased by the present bell tower) became

the model for all minarets in the Muslim west, as well as many church towers after the Reconquest. The decorative and spatial culmination of the mosque was the *maqṣūra*, or area near the mihrab reserved for the caliph. Built on the orders of Al-Ḥakam, who reigned from 961 to 976, this part of the mosque was taken to unprecedented heights of decorative elaboration with the addition of marble capitals, cusped and intersecting arches, complex surface patterning with geometricized vegetal motifs, and Arabic inscriptions. The beautiful glass mosaics that cover the walls and central dome of the *maqṣūra* were executed in imitation of those that decorate the mosque of the Umayyads' ancestors in Damascus, for whom the Umayyads of Spain felt a special affinity.

None of the other congregational mosques that were erected in other cities of medieval Iberia survives, but such small mosques as that of Bab Mardum (Cristo de la Luz, 1000) in Toledo show that the architectural styles of the capital had wide currency. The ruins of Madinat al-Zahra, the splendid Umayyad palace-city built outside of Córdoba in 936, show that Umayyad styles of architectural decoration were not restricted to religious architecture. Córdoba features continued to be held in esteem after the fall of the Umayyads in 1031, as can be seen in such palaces as the Aljafería at Zaragoza, erected by a local *tā'ifa* ruler in the eleventh century, where cusped and intersecting arches were developed to an unusual degree. The integration of al-Andalus with northwest Africa under the Almoravid and Almohad Dynasties of Morocco in the eleventh, twelfth, and thirteenth centuries led to the creation of a hybrid architectural style, in which the exuberance of Umayyad decoration was rationalized and standardized. Only fragmentary remains survive from this period, such as the Giralda (1184–1198), once the minaret of the enormous congregational mosque erected in the Almohad capital at Seville.

Although Almohad power waned in Iberia after their disastrous defeat at Las Navas de Tolosa (1212), the Naṣrid sultans, who reigned from 1230 to 1492, emerged as major patrons of architecture for the remaining centuries of Islamic rule in Iberia. The Naṣrids are primarily remembered for the Alhambra at Granada, originally a palace-city overlooking the city itself, but remains of several other Naṣrid buildings—although no important religious ones—survive (e.g., Granada, Cuarto Real de Santo Domingo). Naṣrid architecture achieves its stupendous effects through the manipulation of exquisitely molded, carved, and painted surfaces of plaster, wood, and glazed tile applied to a rather indifferent armature constructed in brick, stone, and wood.

The primary role of the Qur'ān and of writing in Islam led to the development of the arts of the book—comprising calligraphy, illumination, illustration, and binding—in all regions of the Islamic world. Al-Andalus cannot have been an exception to the general rule, but the widespread destruction of Islamic books following the Christian Reconquest has skewed the picture, and only very few manuscripts survive to testify to the development of these arts in the region. Paper was made locally at Játiva beginning in the eleventh century, but—as elsewhere in the Islamic west—manuscripts of the Qur'ān continued to be copied on parchment in a distinctive *maghribi* (western Islamic) script, characterized by a watery brownish pen line of consistent width with looped descenders. Manuscript illumination was based on geometric motifs with vegetal fillers, executed in gold and several colors. The one illustrated manuscript known to have survived is a thirteenth-century copy of the romance of Bayad and Riyad (Rome, Vatican; Ar. 368). Its illustrations show some familiarity with contemporary work in northern Mesopotamia.

The finest work of the caliphal period is represented by a group of sumptuous carved ivory boxes made for members of the Umayyad court. Such masterpieces as the Mughira Casket (Paris, Louvre; 968) and the Pamplona Casket (Pamplona, Museo de Navarra, 1004–1005) are decorated with an extraordinary variety of figural motifs (the meaning of which have yet to be satisfactorily explained), as well as inscriptions specifying for whom they were made. Although the production of ivory caskets ceased as suddenly as the caliphate itself, workshops continued to produce exquisite wooden furnishings with carved and marquetry decoration in ivory and precious woods. The most important example to survive is an enormous minbar, or pulpit, made circa 1120 in Córdoba for the Almoravid mosque in Marrakesh, Morocco (Marrakesh, Badi' Palace Museum). The history of Iberian Islamic metalwork is known primarily from utilitarian objects cast from copper alloys as well as from scientific instruments, arms and armor. Many objects of precious metal must have been melted down for cash. One exception is a wooden box covered in hammered silver gilt and niello (Girona, cathedral) made in 976 for the Umayyad heir-apparent Hishām and clearly related to the group of ivory caskets.

The production of silk was introduced to Iberia by the Muslims, and sumptuous textiles, such as the so-called Veil of Hishām (Madrid, Real Academia de la Historia) display a mastery of tapestry weaving in colored silk and gold-wrapped thread. Drawloom weaving, which allowed the repetition of complex patterns, was introduced by the eleventh century. Early

examples are based on Near Eastern models, but as in the other arts, a distinctive local idiom quickly emerged. An enormous crimson silk curtain (Cleveland, Museum of Art) dating from the fifteenth century represents the apogee of Naṣrid textiles. The art of knotting pile carpets was also introduced to Iberia from the eastern Islamic lands, and many fine examples have been preserved, including some woven in the fifteenth century with the armorial bearings of noble Castilian families. Early Iberian ceramics are rather mediocre earthenwares decorated with colored slips, but, from the early thirteenth century and particularly under Naṣrid patronage, workshops at Málaga and other centers produced some of the finest and largest examples of overglaze-painted lusterwares ever made, such as the Alhambra vases and the Fortuny tablet.

ARTILLERY

Artillery is defined as hurling objects against enemy objectives by the use of machines that greatly exceed the capability of unassisted human muscle power. The Roman world had developed a variety of such hurling weapons, basically of two types: the arbalest and the catapult. The former took the shape of a large crossbow, placed on a stand or carriage, with each of its arms tightened separately by a windlass. The arbalest could hurl large pointed bolts or small stones on a flat trajectory against humans or lightly fortified objectives. The catapult existed in two varieties: the einarm, powered by wooden springs, and the larger mangonel,

consisting of a lever arm with its base inserted in twisted fiber, often human hair. The crew twisted the fibers tightly together with twin windlasses while holding the throwing arm with a restraining device. When tightened fully, the object to be thrown was placed in a holding enclosure at the free end of the arm. Once released, the throwing arm swung, propelled by the tension of the twisted fibers at its base until stopped by the padded crossbar. Both the swing and the abrupt stop of the arm contributed to the velocity of the projectile, which traveled in a high, rounded trajectory. Projecting rocks of fifty pounds or more over two hundred yards, the mangonel could hit fortified walls from a safe distance. Catapults remained in wide use in the Middle Ages in Iberia and elsewhere, but damp or humid weather inhibited the building of tension in the fibers of the mangonel, making it less serviceable north of the Pyrenees.

A significant improvement, imported from the East, appeared in the twelfth century in the form of the traction trebuchet. In lieu of twisted fibers and torsion power, the traction trebuchet balanced the throwing end of the arm with the power of a crew of men pulling lines attached to the arm. By the thirteenth century an improved variety of this machine, the gravity trebuchet, replaced the crew of pullers with heavy counterweights. These consisted of containers filled with measured amounts of weights that could be adjusted to the weight of the projectile and the distance it had to travel.

Modern models have thrown three-hundred-pound stones over one hundred fifty yards, and potentially can hurl lighter objects to a maximum range of eight hundred yards. Both trebuchet models have more power, flexibility, and accuracy than a catapult, and are less affected by weather. The first European use of the traction trebuchet occurred during the Christian siege of Lisbon in 1147, and its presence is noted in the Occitan-Catalan regions circa 1200. The gravity counterweight model appears to have been employed by King Jaime I of Aragón, noted in his chronicle of the assault on the regions north of Valencia. The contemporary Escorial manuscript of the *Cantigas de Santa María* depicts this model as well, and records of their use continue well into the fifteenth century. Cortés utilized one in his siege of México-Tenochtitlán in 1521. In addition to projectiles, these powerful machines were used to hurl dead humans, putrefying animal carcasses, and assorted forms of refuse into besieged castles and towns to encourage the outbreak of disease. Besieged areas often built trebuchets to destroy the machines of their attackers.

The last dramatic breakthrough followed the trebuchet rather closely in the thirteenth century; this was the use of gunpowder and the cannon. (Both remained

highly experimental until the end of the fifteenth century.) Gunpowder was a blend of saltpeter, sulphur, and carbon, mixed in either a milled powder or in pellet form. It was initially used by Muslim Iberians, packed in vessels and hurled by trebuchets. By the early fourteenth century, gunpowder became itself the propulsive force for projectiles fired from a metal cannon. Again, the first recorded peninsular use was by the Moors, against Aragón in 1331. Some cannon were small-bore, fired bolts and pellets, and were employed against personnel. Others were larger bore, made of cast or beaten metal, and fired projectiles in a manner similar to the trebuchets. Once perfected by Italian casting methods in the later fifteenth century, cannon reached targets at distances of over two thousand yards. They were widely used in the armies of Fernando and Isabel, shattering the fortified places in Granada, and drastically shortening the final campaign against the Moors.

ASCETICISM

Asceticism (in Greek, *askēsis*; training, exercise discipline) is the practice of austerity and self-denial; it is an ideal to which all Christians are called, but is usually associated with monks and other members of religious orders. The verb *askēin* (to strive, run) appears only once in the New Testament when St. Paul (1 Cor. 9: 24–25) compares the Christian life to the games of the amphitheater:

You know that while all runners in the stadium take part in the race, the prize goes to one. . . . run so as to win. Athletes deny themselves. . . . They do this to win a crown of leaves that withers, but we a crown that is imperishable.

By the fourth century asceticism was a characteristic of Egyptian desert monasticism and the inspiration for the monastic life of western Europe, with famous female, as well as male, ascetics. Celibacy (complete abstinence from all sexual activity), fasting (especially rejecting meat), vigils (long hours of prayer, especially at night, thus reducing the hours of sleep and bodily rest) were typical ascetic practices; more extreme forms included wearing a shirt of rough animal hair next to the skin, and whipping the body with a cord of chains, itself later considered a discipline. *The Rule of St. Benedict* (ca. 529), subsequently the cornerstone

of all institutional monasticism in Europe, emphasized moderation in all things, and rejected such extreme practices.

Asceticism had a negative side—self-denial—that saints, mystics and spiritual writers understood as a means of controlling pride and fighting bodily lusts. Fasting, for example, meant the control of one's circumstances, which strengthened the will; it also implied rejection of the values of a materialistic world. The positive side of asceticism aimed at the imitation of the sacrificial life of Jesus, the expiation of one's sins and those of the others, and thus the deeper following of Christ. Theoretically both the positive and the negative sides of asceticism sprang from the love of God and aimed at overcoming obstacles to that love. Asceticism was never an end in itself but a means and preparation for union with God through the development of interior tendencies to charity.

Ascetic monks served the Church as missionaries to pagan peoples: the activities of the Italian Augustine of Canterbury (d. 604) to England, those of the Englishman Winfrith/Boniface (ca. 675–754) in Frisia and Germany, and the missions of the French monk Ansgar (801–865) to Sweden, Norway, and Denmark serve as typical examples. But since the time of the early Church and throughout western Europe, the ideals of monastic asceticism had meant withdrawal from the broader secular society, lifelong stability in the monastery of profession, and the cultivation of both an inner spirituality and of the arts of peace. In Reconquest Iberia, however, a military and crusading spirit exemplified monastic asceticism. The Cistercian Order, which came to Spain within the wake of the Reconquest and was used by count-princes as a stabilizing influence in frontier regions, inspired a number of military religious orders. The Order of Calatrava, founded in 1158 by King Sancho III of Castile; the Order of Alcántara, founded in 1158 with the support of the Cistercian bishop Odo of Salamanca; and the Order of Christ, organized in 1319 by King Dinis of Portugal as replacement for the Knights Templar—all combined Cistercian spiritual ideals with the active military /missionary goal of wresting land from the Muslims. The military values of an iron discipline, obedience, and devotion to duty represented the new ascetic values, and since conversion to Christianity was considered an indispensable part of becoming civilized, the sword and violence replaced prayer and piety as instruments of that conversion.

Christians in most parts of western Europe lived in relatively homogenous religious milieus. Christians in the Iberian Peninsula, however, because of the proximity of Muslims and Jews, perceived their religious faith as a cultural and racial difference. Just as their

sense of identity stressed this difference, so too did their ascetic ideals.

ASTROLOGY AND ASTRONOMY, CHRISTIAN

Few today realize that the modern clock, with its markers indicating twelve equal hours, is the direct descendant of the medieval horologe, on whose face were depicted the stars and planets of the heavens. Instead of using rotating hands, the entire face of the horologe rotated past a stationary marker representing the horizon, in an attempt to reflect simultaneously what was occurring in the sky above. The significance of this observation is that the rotation of the heavens, the alternation between day and night, unrelentlessly regulates the lives of plants, animals, and humans. This constant alternation with the regular appearance of the sun during the day and certain stellar patterns at night eventually came to serve as markers—predictors, in a way—for the somewhat regular patterns of nature. Heavenly patterns, associated with certain seasons, could in turn serve as predictors for following seasons.

Observation of the stars, then, has always contained, beyond the mere theoretical, a practical component. Medieval astronomy and its bedfellow, or perhaps its *raison d'être*, astrology, derived from the Greeks both directly and indirectly. The direct route, through the Romans, proved somewhat sterile. The indirect route, through the Arabs, on the other hand, provided an impetus over the stretch that eventually would lead to Nicolas Copernicus (1473–1543).

When Greek astronomy passed on to Rome, for myriad possible reasons—economics, war, plague, barbarian invasions—it degenerated to a low level and had little impact on medieval culture. The major Greek work passed on to the west was the outdated—by Ptolemaic standards—cosmology found in Plato's *Timaeus*. Isidore of Seville (ca. 560–636) reveals in his *Etymologies* the kinds of information arriving through this direct route. A major problem with information arriving directly from Rome was that it was unaccompanied by a theoretical background or the means to acquire it. Only a portion of Aristotle's writings came through this route. The fundamental interest of Christian astronomy, prior to the impetus it received from Arabic science in the tenth century, consisted essentially of explaining philosophically rather than empiri-

cally the composition of the universe—that is, of explaining cosmology as it was understood from the few Greek sources available.

Nestorian Christians fleeing persecution of the Byzantine Church (fifth century) brought to Persia much Greek knowledge. This, translated into Syriac, was passed on into Arabic, and subsequently into Latin and on to the Christian west.

Those who chide Arab astronomy for not advancing theoretically the Greek science passed on to them often fail to consider what the Arabs did achieve: accurate measurements, compilation of useful tables, refinement of instruments of astronomical observation, and a most important motive for pursuing all of this: astrology.

According to Pederson, Gerber of Aurillac (ca. 945–1003), later Pope Sylvester II, “introduced the abacus, the armillary sphere, and, apparently the astrolabe as teaching aids into the schools in which he taught.” By 1277, King Alfonso X lists at least fourteen instruments of observation and mensuration including horologes in his *Libro del saber de astrología*. Such instruments enabled refining of astronomical science as the means to astrological prediction.

Astrology has always found proponents and opponents, yet the medieval church did not militate against it *per se*, providing it avoided any manner of determinism. The writings of the church fathers and the contents of Greek cosmology generally, although not always, found easy compromises. A major concern of Christianity was ensuring that empirical observation did not infringe upon the rights of a deity whose ways were considered infinite and inscrutable. When irreconcilable differences occurred, theology prevailed.

Medieval cosmology, never summarized or presented comprehensively in any one work, nevertheless manifests three major tenets: that the universe was geocentric, spherical, and finite. Heliocentric and geoheliocentric theories proposed earlier never took root. Geocentricity became so essential to western thought that attempts to displace the centrality of Earth met substantial resistance. One of the alleged reasons why the Inquisition burned Giordano Bruno at the stake (1600) was his support of heliocentrism; nearly half a century later, Galileo spent the final days of his life (d. 1642) under house arrest for his heliocentric theories. In the Ptolemaic view, with the Earth at center, the universe extended outward in a series of concentric spheres, each constituting a heaven inhabited by one of the seven planets (from Greek *planetes*, meaning “wanderer”)—the Moon, Mercury, Venus, the Sun, Mars, Jupiter, and Saturn. The “Eighth Heaven” was the abode of the fixed stars—that is, the constellations, especially the twelve of the zodiac, which never varied in their

appearance (hence the term *fixed*). The ninth, the Crystalline Sphere, followed as the locale of the Primum Mobile, an initiating force believed to set the rest of the circles into harmonious motion. The tenth and last sphere, the Empyrean, was the dwelling place of the Creator. The number of heavens fluctuated between eight and eleven in Christian astronomy, but ten seems to have constituted the standard conception of the universe.

In Aristotelian terms, perfect motion was circular, yet planets were long known to move irregularly across the sky, sometimes even in retrograde motion. Bound by the notion of the circle, Greek astronomers developed the theory of epicycles in an attempt to explain peculiar planetary motion. One planet, the moon, although regular in motion, varied constantly in appearance. Mutability and transience thus came to characterize the sublunary world, the domain of the four elements and their characteristics: water (moist), earth (dry), air (cold), and fire (hot). This portion of the cosmos was subject to change and *influence* (modern “influenza/flu” and “lunacy”) from above. The medieval building blocks of the universe—the characteristics of the four elements—combined to form the four humors: sanguine (hot/moist), choleric (hot/dry), melancholic (cold/dry), and phlegmatic (cold/moist). The heavens—the macrocosmos—thus influenced all aspects of the earth below, the microcosmos. From the Christian viewpoint, of course, Divine Providence had established all of this.

Thus, with astrological prediction providing the motive, and astronomical observation providing the data, empirical science provided facts that increasingly challenged generally held notions of the cosmos—not all at once, but persistently and gradually. The heliocentrism of Copernicus, a theory that remained unacceptable for years to come, constitutes an adequate demarcation between medieval and modern astronomy/astrology.

ASTRONOMY AND ASTROLOGY, JEWISH

Ḥasan ha-Dayyan (fl. ca. 950) and Isaac ben Baruch (1035–1094) are the earliest known Iberian Jews to

have concerned themselves with astronomy. They wrote on calendarics, and their works are known only through extensive quotations by later writers. The earliest Iberian Jew to work on mathematical astronomy proper whose works have survived is Abraham bar Ḥiyya (d. ca. 1136) of Barcelona. He wrote in Hebrew, employing a technical vocabulary of his own making, the following: *Ṣurat ha-Areṣ*., a nontechnical exposition in the tradition of the Arabic *hay’ah* literature; extensive tables (*Luhot ha-Nast*) and instructions for their use (*Heshbon Mahalakhot ha-Kokhavim*); and some shorter items, including one on the differences between Ptolemy and Al-Battānī. Astronomical material is also included in Bar Ḥiyya’s encyclopedia, *Yesodei ha-Tevunah*. Abraham ibn Ezra (1092–1167) wrote a treatise on the use of the astrolabe, *Kli ha-Neḥoshet*, and several sets of astronomical tables, all lost, and a number of other important works. Although Ibn Ezra was born and educated in Spain, and he has long been identified in Jewish tradition as the archetypal Spanish erudite, most of these works were actually written in Italy.

Several Jewish astronomers collaborated in writing and translating treatises for the corpus of astronomical works created under the patronage of Alfonso X of Castile. The most important of these was Isaac Ibn Sid, who is considered the outstanding Jewish astronomer of the thirteenth century. Unfortunately, hardly anything is known about Ibn Sid other than his name and the record of a few of his observations. We know he was the author (not translator) of ten of the Alfonsine treatises and served the king in the preparation of the Alfonsine Tables. His reputation in Toledo was as an astronomer (fl. 1263–1267). Yehudah b. Moses ha-Kohen (Mosca) was another famous translator of works for Alfonso, apparently related to the astronomer Yehudah b. Solomon Mosca, author of the astronomical *Misphatei kokavim: otot ha-shamayim*. He translated the famous *Lapidario* as well as Azarquiel (Al-Zarqālī), and together with Ibn Sid translated other works. The Toledan Judah ibn Mattka was, for all we know, not an astronomer, but he included in his encyclopedic *Midrash Ḥokhmah* extensive summaries of Ptolemy’s *Almagest* and the nonconformist theories of al-Bitrūjī. Ibn Mattka presents some detailed criticisms of Ptolemy’s computation of the planetary sizes and distances. Although it remains unpublished, it incorporates interesting astronomical discussions as well that are devoted ostensibly to religious matters; for example, in the section treating of the secrets of the letters of the Hebrew alphabet. *Midrash Ḥokhmah* was very influential in the diffusion of astronomical knowledge among Jews; it also preserves for the modern scholar fragments of the commentary to the *Almagest* written

by one R. David, perhaps David ibn Naḥamias of Toledo.

Another Toledan, Isaac ben Joseph Israeli, produced in 1310 *Yesod 'Olam*, on the face of it a practical handbook for computing the Jewish calendar but contained as necessary ancillary material exhaustive discussions of solar and lunar theory, and much other material as well. *Yesod 'Olam* survives in over thirty manuscript copies; it and Bar Ḥiyya's *Surat ha-Ares* were undoubtedly the two most popular specimens of medieval Hebrew astronomical literature. In two other works, *Sha'ar ha-Shamayim* and *Sha'ar ha-Millu'im* (both of which are accompanied by tables), Israeli discusses those elements of astronomy, especially planetary theory, that were necessarily left out of his work on the Jewish calendar. Israeli's own son Joseph wrote a summary in Arabic of *Yesod 'Olam*, which was then translated by another family member into Hebrew. *Yesod 'Olam* was dedicated to Rabbeinu Asher (Ben Yehiel), a German rabbi who had just assumed the spiritual leadership of Spanish Jewry. Israeli wished to impress this presumably uncultured northerner with the achievements of Spanish Jewry and, it seems, he met with some success. Asher's son Judah (d. 1349) himself took up astronomy and produced a book, *Huq-qot Shamayim*, whose excellence was attested to by later astronomers. Judah's student Solomon Corcos, who may have worked at Avila, commented upon *Yesod 'Olam*. Joseph ben Isaac ibn al-Waqār, yet another Toledan, drew extensive astronomical tables in Arabic (ca. 1357) and in Hebrew (ca. 1395); these have yet to be closely studied. Solomon Franco (fourteenth century) wrote an astronomical handbook of his own (including tables) and also a treatise on the astrolabe.

We know also of quite a number of Aragónese Jewish astronomers who flourished in the fourteenth century. Most important is Jacob ben Yem Tov Po'el (Bonjorn), whose widely diffused tables were translated into Latin and Catalan. A number of Jews worked in the service of Pedro IV the Ceremonious (1336–1387), most notably the Mallorcan cartographer and instrument maker Isaac Nafuci, and Jacob Corsino, who was active in the preparation of Pedro's own astrological tables and also left us a treatise on the astrolabe. At the end of this century (1391) at least two copies of a complete and illuminated star catalog were prepared on vellum somewhere in central Iberia, close to the thirty-first parallel.

Judah ibn Verga, who worked at Lisbon in the middle of the fifteenth century, composed a number of astronomical treatises. By far the most accomplished Hispano-Jewish astronomer of that century is Abraham Zacut. Zacut taught at Salamanca, for whose meridian he drew up a set of tables; the Latin version, *Almanach*

perpetuus, played no small role in the navigational feats of that great age of exploration.

Jewish thinkers shared in the deliberations of Hispano-Islamic savants concerning the true physical structure of the heavens. Maimonides notes his study of this issue with the students of Ibn Bājja; and the purportedly truer (in the philosophic sense) models of al-Bīrūnī were available in Hebrew translation. Most worthy of scholarly attention are the detailed alternative models developed by Joseph ibn Naḥamias in his *Nūr al-'ālam*, which he himself translated into Hebrew as *Or 'Olam*. The criticisms and innovations in more technical matters of two other Iberians, Al-Zarqālī and Jabir ibn Aflah, were translated into Hebrew and aroused considerable interest.

Astrology seems to have always been a matter of some controversy, though on the whole it probably was accepted by a majority of Jews. Abraham bar Ḥiyya offered a vigorous defense; two of his contemporaries, the mystic Bahya ibn Paqudah and the philosopher Judah ha-Levy, were both critical, as was Maimonides. It appears that, especially in the fourteenth century, astrology figured prominently in polemics with Christians, on account of its pertinence to the issue of freedom of action. The apostate Abner of Burgos (Alfonso de Valladolid) appealed to astrology in his attacks on Judaism, prompting a lengthy rebuttal of astrology from Isaac Polgar in his *'Ezer ha-Dat*.

Few astrological texts were produced. Most interesting is Bar Ḥiyya's astrological history, *Megillat ha-Megalleh*. A small section of Ibn Mattka's encyclopedia is devoted to astrology. Joseph ben Abraham Ibn Waqār promulgated a synthesis of astrology, philosophy, and cabala. Astrology was also utilized in many biblical commentaries. The aforementioned Jacob Corsino, together with two Christians, composed *Tractat d'astrologia* for Pedro IV.

Finally we must take note of the deeper resonances of astronomy in Hispano-Jewish culture. Intellectuals in the main assimilated the notion that astronomy is the noblest of the sciences and a requisite stepping stone to further spiritual development. Solomon ibn Gabirol (ca. 1020–1057) devoted an entire section of his masterpiece *Keter Malkhut* to the science of the stars and, among other poets, most notably Isaac Ibn Ghiyat found inspiration in the stars for many verses.

ASTROLOGY AND ASTRONOMY, MUSLIM

The Andalusian heritage is extremely rich in the fields of astronomy and astrology, two branches of knowledge that were closely related in the Middle Ages. Even, as hence, with a study of the development of astronomical instruments and the compilation of astronomical tables, one should bear in mind that the main purpose of most of the instruments was to simplify the tedious computations involved in the casting of a horoscope and that tables were compiled because planetary longitudes are an essential part of the same horoscope.

During the first century after the Muslim conquest, a Latin astrological, but also astronomical, tradition survived in al-Andalus. 'Abd al-Wāḥid ibn Ishāq al-Ḍabbī (fl. ca. 800), the first Andalusian astrologer who left a written work, composed an astrological *urjūza* (didactical poem in *rajaz* meter) of which only thirty-nine verses are extant and in which astrological predictions are based in the late Latin "system of the crosses" (*ṭarīqat al-ḥkām al-ṣulūb*). This Latin astrological tradition was much more crude than the standard Hellenistic one adopted by the eastern Arabs and introduced later into al-Andalus, and Al-Ḍabbī's *urjūza* was probably corrected, in the eleventh century, by a certain *Oueidalla* ('Abdallah ibn Aḥmad al-Ṭulayṭulī) and finally translated into Spanish (*Libro de las Cruces*) by Yehudah ben Mosheh (fl. 1225–1276) for King Alfonso X. A second instance of such Latin influence is probably to be found in sundials. Qāsim ibn Muṭarrif al-Qattān (and many other sources after him) describes, toward the middle of the tenth century, a *balāṭa*, a very primitive kind of horizontal sundial in which the vertical gnomon is fixed in the center of a semicircle and the limits of the hours are determined by radii that divide the circle equally into fifteen-degree arcs. This instrument is very different from the standard Hellenistic horizontal sundial (in which the solar shadow in the solstices describes two arcs of a hyperbola, while in the equinoxes it describes a straight line) and I believe

that it corresponds to a Latin tradition related to the kind of instruments that are often found in churches and that are called incised dials or mass clocks in England.

Andalusian astronomers seem to have been interested in designing astronomical instruments. The astrolabe, the standard analogue computer used to quickly solve problems of spherical astronomy and astrology, appears mentioned for the first time in an anecdote in which the characters involved are the emir 'Abd al-Raḥmān II (821–852) and his astrologer, Ibn al-Shamir. This instrument attracted the attention of Maslama al-Majrīṭī (ca. 950–1007), who wrote a commentary on Ptolemy's *Planisphaerium*, the main treatise inherited from antiquity in which the theory of the instrument is analyzed. Maslama's disciples Aḥmad Ibn-al-Jaffār (d. 1035) and Abū-l-Qāsim Aṣḥab ibn al-Samḥ (d. 1035) wrote books on the use of the astrolabe and the latter also on its construction. Ibn al-Samḥ's treatise on the use of the instrument was later adapted by the collaborators of Alfonso X in their treatise on the spherical astrolabe (*astrolabio redondo*).

The polar stereographic projection used in the astrolabe implies that the local horizon is projected as an arc of a circle and, therefore, the instrument requires a special plate for each latitude. If an adequate plate for the required latitude is not available, approximate

Astrolabe. From Córdoba. Moorish, 1154. Engraved with Latin text in Italy during the 14th c. Jagellon Library, Museum, Cracow, Poland. Copyright © Giraudon/Art Resource, NY.

methods that do not yield sufficiently accurate results need to be used. To avoid this inconvenience, two Toledan astronomers of the eleventh century, Abū Ishāq Ibrāhīm ibn Yahyā al-Naqqāsh (d. 1100), called Ibn al-Zarqiyāl or Ibn al-Zarqālluh (also Azarquiel), and Abū-l-Hasan ‘Alī ibn Khalaf al-Shajjār or al-Ṣaydalānī (fl. 1068–1072), designed the first universal astrolabes based on a meridian stereographic projection in which any horizon is projected as a radius of the instrument and a rotating ruler can easily become a movable horizon and be adapted to any required latitude. Ibn al-Zarqālluh seems to have been the first to design a universal instrument of this kind. The description of two varieties of the so-called *azafea* (*al-ṣafṭha*) were dedicated by him to the ‘Abbādī prince and later king of Seville, Al-Mu‘tamid (1069–1091). Unlike the standard astrolabe, Ibn al-Zarqālluh’s instruments lacked a rete or spider, the rotation of which represents that of the celestial sphere around the earth. This is probably why ‘Alī ibn Khalaf designed, in 1071 to 1072, a new instrument that he called *al-aṣṭurlāb al-ma’mūnī* and dedicated to King al-Ma’mūn of Toledo (1043–1074). This instrument was called, in the Alfonsine translation, *Lamina universal* and *Orizon universal*, and it superimposed a rotating rete on the standard grid of coordinates characteristic of Ibn al-Zarqālluh’s *azafeas*. Finally, a last attempt to design a plate for all horizons, to be used with a conventional astrolabe, was done, in the thirteenth century, by the astronomer of Granada Ḥusayn ibn Aḥmad ibn Bāṣo. This new instrument bears the influence of the two aforementioned Toledan astronomers and of the characteristic Eastern “plate of horizons” usually ascribed to the Syrian astronomer Ḥabash al-Ḥāsib (d. ca. 864).

Both the standard and the universal astrolabe solved, quite easily, the problem of the division of the houses that was necessary to cast a horoscope; still, the computation of planetary longitudes using a set of astronomical tables (*zīj*) implied quite a long work. This is why *equatoria* (instruments consisting of Ptolemaic planetary models drawn to scale) were designed in order to offer graphical solutions to the problem. Although a possible Eastern origin has been suggested, it is a fact that the earliest descriptions of the *equatorium* appear in al-Andalus in the eleventh century. They were written by the aforementioned Ibn al-Samḥ and Ibn al-Zarqālluh, and by Abū-l-Ṣalt Umayya ibn Abī-l-Ṣalt (ca. 1067–1134). The two former treatises were the object of an Alfonsine Spanish translation that could be the starting point of the long tradition of Latin treatises on this instrument that appeared in Europe between the thirteenth and seventeenth centuries. Apart from its practical nature, the instrument described by Ibn al-Zarqālluh contains an important

theoretical development. The complexity of the Ptolemaic Mercury model led him to represent the planet’s deferent as an oval (*bayḍī*) curve (called *figura pinno-nada* in the Spanish translation), practically equivalent to an ellipse. Thus, he seems to have been the first astronomer with enough courage to cross the boundary of an astronomy based on circles and introduce a new astronomy of noncircular curves.

Astrolabes and equatoria are analogue computers, not observational instruments, the description of which is rare in the Andalusian tradition. Only two instruments of this latter kind appear documented: one of them is Ibn al-Zarqālluh’s treatise on the construction of the armillary sphere extant only in the Alfonsine version (*Libro de las Armellas*). The second was designed by Jābir ibn Aflaḥ (fl. 1150). Conceived as a large-sized observational instrument (Jābir mentions a diameter of about six spans for the basic graduated circle) that can be mounted on any one of the three astronomical planes (horizon, equator, or ecliptic), it has been considered a predecessor of the *torquetum*, a European instrument described for the first time toward the end of the thirteenth century.

A third center of interest in Andalusian astronomy can be found in astronomical handbooks with tables (*zīj*es). The first *zīj* was introduced in al-Andalus in the time of ‘Abd al-Rahmān II (821–852), and it was probably a work of Indian descent, the *Sindhind* in the recension made by Muḥammad ibn Mūsā al-Khwārizmī (fl. 800–847), which, in the second half of the tenth century, was revised and adapted by Maslama al-Majrīṭī and his disciples. The time of Maslama was also that of the introduction, in al-Andalus, of the more elaborate Ptolemaic astronomy, but the Indian tradition was never completely forgotten in this country. A good example can be found in the *Tabulae Jahan* (an adaptation of Al-Khwārizmī’s *Sindhind* to the coordinates of Jaén to which Ptolemaic or original materials were added) of Ibn Mu‘ādh (d. 1093), of which only the canons are extant in a Latin translation by Gerard of Cremona. Much more successful were the *Toledan Tables*, only known through a Latin translation extant in an enormous number of manuscripts. These tables seem to have been the result of a hasty adaptation, done circa 1069, of all the available astronomical material (Al-Khwārizmī, Al-Battānī, and the *Almagest*) to the coordinates of Toledo. Its authors were a group of Toledan astronomers led by the famous *qādī* Abū-l-Qāsim Sa‘īd ibn Aḥmad ibn ‘Abd al-Rahmān ibn Muḥammad ibn Sa‘īd (d. 1070). Among them we find Ibn al-Zarqālluh and ‘Alī ibn Khalaf as well as others. Even if the results achieved were not brilliant, the *Toledan Tables* incorporated the first results of a programme of observations that were continued by Ibn

al-Zarqālluh until much later, as well as a set of trepidation tables that appear for the first time in al-Andalus. Trepidation theory—also called theory of accession and recession—which was later (ca. 1085) the object of further study by Ibn al-Zarqālluh in his book *On the Motion of Fixed Stars*, has an obscure Eastern origin but was mainly developed in al-Andalus. Its purpose is to design geometrical models that will justify the slow diminution of the obliquity of the ecliptic as well as the irregularities—based on inaccurate observations—in the velocity of the precession of the equinoxes. Ibn al-Zarqālluh's theoretical work also includes a modification of the Ptolemaic lunar model as well as a book on the Sun in which he designed a solar model with variable eccentricity and established the solar apogee's own motion. These ideas became very influential in later Andalusian, Maghribī, and European astronomy.

After the *Toledan Tables* several Andalusian *zīj*es were compiled. The first of these—although not properly a *zīj*—is Ibn al-Zarqālluh's own *Almanac* (extant in Arabic and in a Spanish Alfonsine translation), an adaptation of a Greek work computed by a certain Awmātiyūs (Humeniz) in the third or fourth century A.D. Its purpose is to furnish astrologers with astronomical tables allowing them to obtain planetary longitudes without all the computation involved in the use of a *zīj*, and it uses the Babylonian planetary cycles usually called "goal years." After the completion of one of these cycles, the longitudes of a given planet will be the same in the same dates of the year as in the beginning of the cycle. Ibn al-Zarqālluh's ideas (trepidation, new solar and lunar models) also influenced other conventional *zīj*es, such as those computed by his disciple Abū Ja'far Ahmad ibn Yūsuf, known as (Ibn) al-Kammād (fl. beginning of the twelfth century), by Ibn al-Hā'im (fl. 1204–1205) and by Ibn al-Raqqām (d. 1315), the author of an important book on sundials. Furthermore, Ibn al-Zarqālluh's influence is also obvious in astronomers of the Maghrib, such as Ibn Ishāq al-Tūnisī (fl. beginning of the thirteenth century) and Ibn al-Bannā' al-Marrākushī (1256–1321).

Andalusian astronomy reached its peak with Ibn al-Zarqālluh and a period of decay starts immediately after when, in the twelfth century criticism of Ptolemaic astronomy started. This criticism had a mathematical basis in the case of Jābir ibn Aflah (fl. ca. 1150), whose *Iṣlāḥ al-Majisī* (Correction of the *Almagest*) analyzed the inconsistencies and methodological defects of Ptolemy's work. A second kind of criticism was far more ambitious as well as dangerous: it was exerted by an important group of Aristotelian philosophers who rejected Ptolemy because of the mathematical (not physical) character of his planetary models

that disagreed with Aristotelian physics. The *Almagest* was obviously useful for the computation of planetary positions but it just did not describe the real universe. Such criticisms appear, in very general terms, in the works of Ibn Bājja (1070–1138), Ibn Tufayl (before 1110–1185), Ibn Rushd (Averroës) (1126–1198), and Maimonides (1135–1204), but it is only with Abū Ishāq Nūr al-Dīn (ibn) al-Bītrujī, a disciple of Ibn Tufayl, that a complete cosmological system appears in his *Kitāb fī l-hay'a*, probably composed between 1185 and 1192. With a limited knowledge of the astronomical literature available, he conceives a homocentric system that is purely qualitative, has too many defects and inconsistencies, and could never have been the base for the computation of a set of tables. It is, however, interesting to remark that, in order to explain the transmission of motion between the physical planetary spheres, he does not use Aristotelian but neoplatonic dynamics.

ASTURIAS, KINGDOM OF THE

The history of the kingdom of the Asturias (ca. 718 to 910) has to be reconstructed largely on the evidence of two brief chronicles first composed in the late ninth century, one of which, the *Chronicle of Alfonso III*, survives in two variant versions compiled early in the tenth century. The other chronicle, known as the *Chronicle of Albelda*, from the monastery in which a short continuation was added to it in 976, is much briefer than the Alfonsine texts, but is independent of

them. To these chronicles can be added a few notices of the kingdom in the Arab historians of Umayyad Spain and in some of the contemporary Frankish annals. There also exists a body of charters relating to royal and other deeds of gift and sale, but many of the earliest of these are either forged or have been interpolated.

Although it is possible to reconstruct an outline history of the kings of the Asturias, it must be appreciated that this has to be done on the basis of a predominantly late-ninth-/early-tenth-century perspective. Thus, information concerning the creation of the kingdom and the first hundred years of its existence may be affected by the strong ideological preoccupations of the reign of Alfonso III (866–910). Particular care is needed in assessing the foundation legends of the kingdom and its royal dynasty.

In the Asturian historiographical tradition members of the family of the penultimate Visigothic king Wittiza (692/4–710) are cast consistently as the villains in the story of the fall of that kingdom and the ensuing foundation of the Asturian one. Wittiza himself is portrayed as an enemy of the father of Pelagius, who was to become the first king of the Asturias, and the cause of the latter's exile. When Pelagius subsequently led a revolt in the Asturias against the Arabs, one of Wittiza's sons, Oppas—who is made out to be either the bishop of Toledo or of Seville—accompanied the Arab army that was sent to crush him. In the two versions of the *Chronicle of Alfonso III* an elaborate but fictitious exchange of insults is made to take place between Pelagius and Oppas immediately prior to the battle fought at Covadonga, in which the Arabs are defeated and the independence of Pelagius's tiny kingdom is established.

In reality, very little is known of the causes and events of the Asturian revolt, or of the origins of Pelagius. Even the date of the battle of Covadonga is uncertain, though the traditional date of 718 is probably to be preferred to the more recent suggestion of 722. A local revolt, allied to a subsequent lack of interest on the part of the Arab governors in restoring their hold over the northern mountains of the Iberian Peninsula explains how the kingdom came into being, and why it was able to survive. In retrospect this was anachronistically seen as the beginning of the whole process of the Reconquest, and the crucial battle came to be associated with a miraculous appearance of the Virgin Mary.

After the Battle of Covadonga the chronicles record nothing of the reign of Pelagius beyond his burial at Cangas de Onís and the succession of his son Fáfila (737–739). That the kingdom he had created covered little more than the region of the eastern Astur-

ias, centered on Cangas, is probable, and no further extension of its territory occurred until the accession of Pelagius's son-in-law Alfonso I (739–756) following the accidental death of Fáfila. Alfonso was the son of a duke of the region called Cantabria, the precise area of which in this context cannot be deduced. But his inheritance must have led to an eastward extension of the kingdom into Basque regions. Alfonso's son Fruela I the Cruel (756–768) faced what the chroniclers describe as a Basque revolt, and made a diplomatic marriage to a Basque wife after its suppression.

It is possible that the chronicle references to revolts on the part of both Galicians and Basques in this period are ideologically tainted, and that what was really at issue was resistance to Asturian conquest. Under both Alfonso I and Fruela I the western frontiers of the kingdom were expanding rapidly, first to the river Miño and then to the Atlantic coast. Although in the later perspective of the Reconquest this was a liberation, there are no good reasons to assume that in the eighth century the Basques or the Galicians wished to be ruled by the Asturias.

Warfare was also initiated on the southern frontiers in the reigns of these two kings. Various settlements in the northern Meseta were captured, and their Hispano-Gothic populations moved north into the Asturias. Rather than occupying the newly acquired territory on the Leonese Plateau, the kings were trying to create a deserted zone between themselves and the Arabs in the south and center of the peninsula. The Asturian chronicles attribute this activity to Alfonso, while Arab sources give the credit to Fruela.

Following the latter's murder in 768, the throne did not pass to his infant son Alfonso, but was taken in turn by a number of other members of the ruling family. This concern, not so much with primogeniture but with preserving a dynastic succession, is in marked contrast with the practices of the preceding Visigothic period. The first of these kings was Aurelius (768–774), a cousin of his predecessor and possibly implicated in his killing. After his death power passed to Fruela's brother-in-law Silo (774–783), and then to an illegitimate son of Alfonso I called Mauregatus (783–788). Of these kings hardly anything is known, and in general this was a period in which no further territorial expansion took place, and in which relations with the Arab south were generally pacific. Under Aurelius a servile revolt occurred and was crushed—a tantalizing episode about which no further details are preserved.

It was expected that Fruela's son Alfonso would obtain his father's throne on the death of Silo, when he was chosen by the Asturian court nobility. However, Mauregatus staged a coup, probably with Galician

backing. On his death his supporters ensured the succession of Vermudo I (788–791; later known as “the Monk”), a brother of Aurelius. A defeat at the hands of an Arab army in 791 destroyed this king’s credibility as a war leader, and he returned to or entered monastic life, leaving the way clear at last for Alfonso II (791–842), the son of Fruela I. Unlike his two predecessors, whose power base lay in Galicia, Alfonso’s support derived primarily from the Basque eastern part of the Asturian kingdom.

Alfonso’s accession coincided with, and indeed was caused by, a period of renewed conflict with the Umayyad Emirate of Córdoba. Under Hishām I (788–796) annual expeditions were launched from 791 onward against the Christian territories in the north. In 794 Alfonso II achieved a victory over one of these, but the Asturian chronicles make no mention of the other raids that did penetrate the kingdom, and which are recorded in the Arabic sources. In 797, in the period of disorder in the south following the premature death of Hishām I, Alfonso sent a raiding expedition down the western side of the peninsula; it reached as far as Lisbon. Some of the loot from this was sent to the Frankish king Charlemagne, who had been in diplomatic contact with the Asturias. A planned Frankish intervention in the peninsula in that year did not occur due to fighting in Saxony, and when the Frankish armies did move in 801 and take Barcelona, no comparable Asturian expedition was launched, probably because Alfonso had been briefly overthrown in a coup.

After his restoration to power in 802 little military action is reported in the Asturian sources, though Arab raids did occur in 823 and 838. Instead the chronicles record his building projects in Oviedo, the new capital he had founded following his accession. Of the extant buildings in the city, the Church of San Julián de los Prados, with its remarkable frescoes, is normally attributed to the reign of Alfonso II. However, it is possible that this should be redated to the time of Alfonso III (866–910). Other fragments of buildings, including the Camara Sancta, a reliquary chapel attached to the first cathedral of Oviedo, may be attributable to Alfonso II. For the chroniclers, Alfonso’s work in the city marked a restoration of “the Gothic order,” and from his reign dates the beginning of the self-presentation of the Asturian kingdom as the successor to and heir of that of the Visigoths, with consequential claims to a peninsula-wide authority.

Alfonso II’s failure to marry, which later earned him the epithet “the Chaste,” led to the throne passing to a nephew, called Nepotian, upon Alfonso’s death in 842. However, the new ruler was instantly challenged and overthrown in a civil war with Ramiro I (842–850), son of Vermudo I the Monk. As with his

father, Ramiro’s backing came from Galicia. Although Nepotian is treated as a usurper in the chronicles of the time of Ramiro’s grandson, there is little doubt that he was a legitimate, if unsuccessful, king.

Under Ramiro I Arab raids against the kingdom occurred in 846 and 849 or 850, but his son Ordoño I (850–866) was able to take a more active role in events in the south, and the Asturian kingdom entered a new phase of expansion for the first time in nearly a century. Some of the former settlements on the Meseta, such as León, were repopulated, and a number of others, including Talamanca and Coria, were looted, their Muslim garrisons massacred, and their inhabitants enslaved. An expedition sent in 854 to aid rebels in Toledo against the emir Muḥammad I (852–886) proved a disaster, but Ordoño was more successful in opposing the growing power on the eastern fringes of the kingdom of the local Muwallad potentates of the Banū Qāsi. In 859 the most powerful of these, Mūsā Ibn Mūsā was defeated at Albelda.

The kingdom was subjected to large-scale raiding by Umayyad armies in 863, 865, 866, and 867. Although the new king, Alfonso III (866–910), succeeded his father in a period of military difficulty, his reign was marked by more extensive and irrevocable expansion of the kingdom southward and repopulation of settlements on the Meseta and in Castile. Castile made its first appearance as a county at this time, and its principal town of Burgos was subsequently founded in 883. Alfonso’s successes were in large measure due to the growing internal difficulties of the Umayyad regime, and the decline of its central power in the 880s. In 878 Alfonso won a significant victory over an Arab raiding army at Polvoraria, which gained him a three-year truce. After renewed raiding in 882 and 883 a peace was reached that lasted for the rest of the reign.

The peace with Córdoba and the growth of repopulation and the development of towns south of the Asturian mountains led to a shift in the political balance of the kingdom. Frontier settlements in the south, such as Zamora, grew in importance, and a southward move of the capital from the distant if secure Oviedo became necessary. The Kingdom’s authority over the increasingly important frontier fortresses, together with Alfonso’s son’s impatience with their father’s longevity, led to a coup in 910 in which Alfonso was deposed. He died the same year, and claims in twelfth-century sources that he did so while returning from a final expedition against the Arabs, which his sons let him lead, should be doubted. His eldest son García (910–914) moved the capital to León, and so with Alfonso III the kingdom of the Asturias came to an end.

ATHANAGILD, LORD OF TUDMIR

Athanagild was the son of the Visigothic noble Theodemir, lord of a region in the southeast of the Iberian Peninsula that was known to Arab authors as Tudmir. This included seven towns, most of which have been identified, including Orihuela, Lorca, and possibly Valencia. Theodemir's status and the virtual independence of this region under his control was guaranteed by the treaty of capitulation he made with the Arab governor 'Abd al-Aziz ibn Mūsa in 713. It is probable that by about 740 Athanagild had inherited his father's political authority, and the *Chronicle of 754*, which is the only source that refers to him, describes him as "the wealthiest lord of all." He was also notably generous, and this may explain the significance of the only episode in his career that the chronicler records. Around 743/4 the governor Abū al-Kattar (743–746) obliged Athanagild to pay a fine of 27,000 gold pieces, but this was paid for him by the Syrian army, which had entered Spain with Balj ibn Bishr in 742. This may imply that elements of this body were being settled in the region at this time, despite the terms of the treaty of 713. At the instigation of the Syrians, Athanagild was reconciled with the governor and was rewarded by him. Nothing more is known of his life, but the region of Tudmir had certainly lost its independent status by the 780s.

ATAPUERCA, BATTLE OF

This battle in 1054 between Fernando of León-Castile and his brother García IV of Navarre can only be

viewed through a Castilian historiographical tradition. Because García was killed in the course of the battle, which in consequence turned into a significant defeat for the Navarrese, his brother Fernando was anxious to avoid any accusation of fratricide. In the *Chronicle of Nájera*, and even more so in Rodrigo Jiménez de Rada's *De Rebus Hispaniae*, responsibility for initiating the conflict is placed firmly on the Navarrese and especially on the slain monarch. The battle was fought in the vicinity of Oña in northeastern Castile and was actually prompted by Fernando's ambition to make himself master of this region. In practice the battle was a vital one for the future of the Leonese-Castilian kingdom, as it put an end to nearly a century of Navarrese domination of eastern Castile, and enabled Fernando's kingdom to establish itself as the most powerful of the Christian states of northern Spain. In that the chronicles stress the role of two of his own knights in the killing of King García who in the Castilian tradition turned against their lord for his unjust prosecution of the conflict with his brother, it is even possible to suspect that treachery was involved, and that the death of the Navarrese ruler, which was crucial to the outcome, was the product of assassination under cover of battle.

AUGUSTINIANS See MONASTICISM; RELIGIOUS ORDERS

AUTO DA FE

Literally an "act of faith," an auto da fe (de fe in Spanish) was a penance demanded by the Church from a person found guilty of religious error, in faith or doctrine. The Papal Inquisition, founded in the thirteenth century, normally held ceremonies for the reconciliation of penitents in churches, but the new Spanish Inquisition, after 1478, moved such ceremonies to public streets and squares. First in Castile, and soon afterward in the Crown of Aragón, convicted "heretics," after secret trial and sentencing, were processed through the

streets of their native towns, barefoot, carrying candles, and clad in mitres and robes known as *sambenitos*, which detailed graphically the offences for which they had to do penance. A large crowd, including local ecclesiastical and secular authorities, would assemble to hear a sermon against heresy, and the reading of the penitents' sentences. Relapsed heretics, primarily "Judaizing" Christians up to about 1510, were then handed over to the secular authorities for burning at a separate site. In a dramatic early case, 750 were processed in an auto da fe in Toledo on 12 February 1486, while in both 1502 and 1504 over a hundred individuals were burned after autos da fe in Córdoba. Later in the sixteenth century, many other types of people, such as former Muslims, Protestants, and even gypsies and bigamists, were processed, but in decreasing numbers. Autos da fe in Spain, while losing none of their terror for those directly involved, became popular spectacles, but increasingly damaged the country's reputation abroad.

AUTOBIOGRAPHY

It is unusual for autobiography to be allowed its own entry in works of reference: users of the *Dictionary of the Middle Ages*, for instance, or of *Cassell's Encyclopaedia of World Literature* will look in vain for an entry. Yet autobiography is not merely one kind of biography, for it often has as much in common with other kinds of first-person expression as it does with most third-person narratives of a life.

There are classical and medieval Latin precedents—and sometimes direct sources—for most forms of biography in medieval Spanish: Berceo's *Vida de Santo Domingo de Silos*, or Gutierre Díez de Games's *El Victorial*, or Fernán Pérez de Guzmán's volume of biographical sketches, the *Generaciones y semblanzas*. The range of precedents for autobiographical writing is much more restricted, though they include two masterpieces, St. Augustine's *Confessiones* and Peter Abelard's *Historia calamitatum*. These, however, with their strongly confessional nature, seem to have had more influence on other genres than on autobiography.

The distinction often made between real and fictional autobiographies is hard to maintain in practice. Leonor López de Córdoba's *Memorias*, guaranteed by the author to be a truthful account, can now be seen to present a reordering and reinterpretation of events. At the other end of the spectrum, the *Libro de buen amor*, though clearly dependent on Latin and vernacular precedents for every episode, gives us a strong (though perhaps misleading) impression of the personality behind the narrative, and was at one time read as genuinely autobiographical. Other fictional constructs have always been recognized as such: Juan de Flores's *Grimalte y Gradisa*—in direct line of descent from two woman's-voice autobiographical narratives, Ovid's *Heroides* and Boccaccio's *Elegia di madonna Fiammetta*—and the brief but memorable snippets of recollection by several characters in *Celestina* (though we should recall that behind one of these there probably lies a memory of Fernando de Rojas's childhood).

Third-person biographies and first-person, more or less fictional, narratives converge in several forms of autobiographical writing in late medieval Spain. Some travel books take a personal approach to their subject; this is especially noticeable in Pero Tafur's

Andanças y viajes. Teresa de Cartagena's *Arboleda de los enfermos* gives us a memorable and convincing impression of the pain of growing deafness, and of life within a convent. Autobiographical vignettes may also be found in letters. The great majority of surviving medieval letters are more or less formulaic compositions, concerned with affairs of state or of business (that is why they have been preserved in archives), and some of those that do have a personal tone are concerned with other people, rather than with the writer's own life. Others, however, do speak of the writer's life and concerns. We have nothing in medieval Spanish comparable to the fifteenth-century letters of the Paston family, and for a collection of letters that open a window onto a woman's life we have to turn to Catalan, to the letters written by Sereneta de Tous to her husband, Ramon from 1374 to 1376. There is, however, a letter in Castilian by Constanza, wife of Juan Manuel, sent in 1327 to her father, Jaime II of Aragón, begging him to send Aragónese doctors to treat her worsening illness.

Most of the letters that can be regarded as autobiographical writing are from the fifteenth century. A particularly interesting collection preserves letters written between 1420 and 1431 by Fernando Díaz de Toledo, the converso archdeacon of Niebla, to the prior and other members of the monastery of Santa María de Guadalupe. These letters give a rounded picture of a life. They do deal with spiritual matters, but they are concerned more insistently with the archdeacon's worries about his health, his financial affairs, and such matters as a sheepskin coat that he had been promised.

When we turn from autobiographical letters to formally structured autobiography, two texts claim our attention. Both belong to an autobiographical subgenre, the memoir: Part 3 of Juan Manuel's *Libro de las tres razones* (ca. 1337–1342) and the *Memorias* of Leonor López de Córdoba (ca. 1400). The *Libro de las tres razones* is a blend of family history, personal memoir, and political advocacy. Juan Manuel, son of Prince Manuel and grandson of Fernando III, was obsessed by the belief that his father and he himself had been unjustly deprived of the right to rule, since Manuel had had the blessing of his parents, while Alfonso X was cursed by them. Part 3 of the *Libro* gives a vivid picture of Sancho IV's deathbed, when the tubercular king can only just find the strength to admit to the twelve-year-old Juan Manuel that he belongs to the blessed line, unlike the accursed line that holds the throne. The picture is compelling and moving, but what relation does it bear to reality? Is this a memoir or a well-crafted fiction?

The same question may to some extent be asked about Leonor López de Córdoba's *Memorias* (written

a generation before what has been described as the first English autobiography, *The Book of Margery Kempe*). The narrative core is a broadly accurate account of the misfortunes of the author and of her family, though some of the incidents and a good deal of the interpretation have been viewed with skepticism. The family were on the losing side in the civil war that ravaged Castile in the 1360s and 1370s, and after their capture in 1371, Leonor's father was executed. She and the rest of the family were imprisoned for years, some dying from the plague. When she was released, she and her husband were penniless, so she was dependent on an aunt who had been on the winning side. Much of the book is taken up with the power struggles within the aunt's household—Leonor López against her cousins and the aunt's servants—and and eventually Leonor loses, being banished from the household, and the *Memorias* ends. From the moment she leaves prison, she lives in a gynocracy, a female micro-society that mirrors the patriarchal macrosociety of Castile. She tells us about herself without any barriers of artifice. We see her life as she sees it, and some of the scenes stay in our memory as they stayed in hers: her father being taken to execution, her young brother dying of the plague, her fury when the aunt's servants thwart her plans.

The harvest of autobiography in medieval Spanish is small, but the quality is exceptionally high. Part 3 of the *Libro de las tres razones* has long been acclaimed as a masterpiece of first-person narrative; Leonor López de Córdoba's memoir has, in the last thirty years, been recognized as a key text with an authentic personal voice, and similar recognition for the archdeacon of Niebla's letters will not be long delayed.

AVERROËS, ABU 'L-WALĪD MUHAMMAD B. AHMAD B. RUSHD

Commentator on Aristotle, philosopher, physician and jurist; the greatest intellectual figure of Islamic Iberia. Averroës (the name is a corrupt Judaeo-Latin transcription of the Arabic name Ibn Rushd) was born in Córdoba in 1126, into a family of eminent judges. Little is known for certain about his early career, but he undoubtedly received the traditional Islamic education in Arabic literature and linguistics, jurisprudence and theology, together with instruction in medicine and philosophy. Of the great Muslim sages of medieval Iberia, Ibn Rushd can personally only have known Ibn Tufayl, who became his mentor at the court of the Almohad caliph Abū Ya'qūb Yūsuf. In an incident that Gauthier has described as being "of capital importance not only in the biography of Averroës, but in the development of European philosophy" Ibn Tufayl introduced Averroës to the learned sovereign, who was deeply impressed by his subject's thorough knowledge of the opinions of the "philosophers" (that is to say, the Arabic *falasifa* working in the tradition of Aristotle and the Neoplatonists). Abū Ya'qūb subsequently called upon Averroës to make Aristotle's hitherto all-too-obscure writings more perspicuous by means of commentaries. As a result of the caliph's favors, he was appointed *cadi* of Seville in 1169, chief *qāḍī* of Córdoba in 1171, and physician to the court of Marrakesh in 1182. The accession to the caliphate, in 1184, of Abū Ya'qūb's son, Al-Manṣūr, did not at first change Ibn Rushd's fortunes. However, around 1194/5, al-Manṣūr found himself obliged to dissociate himself from him, yielding to the growing pressures of popular fundamentalism; Averroës's philosophical writings were burned, and the philosopher himself exiled to Lucena, southeast of Córdoba. This sentence, so obviously out of tune with the caliph's own intellectual leanings, was soon revoked, however and Averroës was allowed to return to Marrakesh, where he died on 10 December 1198. Averroës's cardinal legacy are his commentaries on Aristotle; they earned him the antonomastic title "the Commentator" among the Latin schoolmen, who kept relying on his translated commentaries after St. Thomas Aquinas had tried to supplant them with his own work and even after the great Averroistic crisis of the 1270s. Significantly, Aristotle's works continued to be accompanied by the elucidations of his commentator in the printed editions of the fifteenth and sixteenth centuries. Averroës composed two kinds of commentaries, "short" and "middle," on most of the writings of the Aristotelian corpus accessible to him; in addition, we have "long" commentaries" on the *Posterior Analytics*, *Physics*, *De Caelo*, *De Anima* and *Metaphysics*. The short com-

mentaries or *epitomai* (in Arabic *jawāmi*) are manuals of Aristotelian philosophy, paraphrases written early in Averroës's career, and show the commentator under the influence of the Neoplatonizing Aristotelianism of his predecessors Al-Fārābī and Ibn Sīnā (Avicenna). In the later middle commentaries (Arabic, *talkhīs*), more detailed expositions of the philosopher's thought, we already witness a gradual emancipation from this older tradition of interpretation and see Averroës working toward an ideal of recovering Aristotle's thought in its original purity. Ibn Rushd's exegetical endeavors culminated in the long commentaries (Arabic *tafsīr*), scrupulous word-for-word commentaries of a rigorous literary form resembling that used in traditional Qur'ānic exegesis; and appropriately so, for the words of Aristotle had by that time gained almost divine authority for Averroës.

The long commentary on *De Anima*, fruit of a lifelong exploration of Aristotelian psychology, contains Averroës's final and most mature solution to the problems posed by Aristotle's notoriously difficult remarks on the nature of the "agent intellect." According to Aristotle, there is an active and a passive aspect to the human mind: the intellect, which is passive insofar as it receives the immaterial forms of sense percepts, is seen as active inasmuch as it must, prior to their reception, abstract these forms from the material conditions of sense perception. Averroës believed that both the active (or "agent") and the passive ("material," "possible") powers of the intellect were one for all human beings. The possible intellect, being the receptacle for the forms of material things, could not itself possess such a form; otherwise it would interfere with and distort the forms it received. But if it was immaterial, it had to be unique, for it is matter that causes plurality. The unicity of the agent intellect, on the other hand, safeguards the universal validity of human cognition in that the individuals' data of sense perception are abstracted and universalized by one faculty common to all. The activity of thought can on this interpretation only be ascribed to the individual inasmuch as his or her material organs of sense are necessary to furnish the transpersonal intellect with data to abstract. The thoughts themselves are no single person's possession; rather, the intellect is envisaged as a common pool of knowledge participated in by the individual according to each person's abilities. Full "conjunction" with the transcendent intellect, the possession of all possible knowledge, is the end and rare fulfillment of intellectual activity. Despite the denial of personal immortality that it implies, this theory of "monopsychism" exercised a deep and lasting influence on the development of philosophy in the Latin west. Its adoption by some Parisian masters in the latter

half of the thirteenth century provoked the most profound intellectual crisis in the as yet young history of medieval Aristotelianism, but even the condemnations of 1270 and 1277 could not, in the long run, thwart its attraction. As Philip Merlan has brilliantly argued, the structures of Averroean psychology continue to be discernible in contemporary philosophy, especially in the Kantian tradition (compare with Kant's transcendental unity of apperception/*Bewußtsein überhaupt*).

Averroës never held the theory of "double truth" often falsely attributed to him: in his view, the truths of philosophy and religion were in perfect agreement. As he wrote in chapter 2 of the *Faṣl al-maqāl*, "truth does not oppose truth but accords with it and bears witness to it." Hence, contradictions between religious and demonstrative truth can only be apparent, caused by the fact that the Qur'an frequently uses symbols and rhetorical or dialectical arguments in order to reach the majority of the people. The superficial oppositions thus arising must be resolved by an allegorical interpretation (*tawīl*) of Scripture that penetrates from the level of its apparent (*ẓāhir*) to that of its hidden (*bāṭin*) meanings. But *tawīl* is only for the philosophers and should be taught esoterically, as it would endanger the faith of those untrained in demonstrative reasoning. With philosophy thus becoming the ultimate judge of the meaning of revealed truth, Averroës takes a rationalist stance toward religion: it has nothing to offer that reason cannot reach autonomously and without the veil of symbols. This attitude, while replacing faith with intellectual conviction, does not overtly challenge the truth of Islam (which does not contain any supernatural mystery in the Christian sense); however, it relegates it to the pragmatic role of teaching the "simple people" through symbols what the philosophers know with the clarity of reason.

As in the speculative branches of philosophy, Averroës also championed a resolute return to the principles of pure Aristotelianism in the natural sciences. In what has called the Andalusian revolt against Ptolemaic astronomy, Averroës and his contemporary Al-Bitrujī (Alpetragius) censured Ptolemy for departing from Aristotelian physics by postulating epicycles and eccentrics; but unlike Al-Bitrujī, Averroës's grasp of the Aristotelian alternative to epicycles and eccentrics remain unsatisfactory and vague. Averroës was not prepared to meet Ptolemy on the level of empirical observation; indeed he dismissed his computational evidence as "arrived at by the use of instruments" and "based on the senses," opposed to the empirical method "the true theories based on rational precepts" (especially on the *Metaphysics*). According to Averroës, Ptolemaic astronomy was in outright contradiction to these rational principles, mainly because it as-

sumed circular movement not around the center of the universe and two contrary motions for one planet (nature would not employ two movements for what it could possibly achieve with one, Averroës claimed, for "nature does nothing in vain"). He hoped to account for the movement of the planets by positing, in Aristotelian fashion, simple homocentric spiral motions in one direction—without, however, checking the empirical viability of this proposition. It is interesting that Averroës's criticisms of Ptolemy, although almost exclusively negative in their failure to provide an alternative theory, later influenced Copernicus by convincing him of the shortcomings of traditional astronomy.

Similarly, the *Kullīyat fī-l-ṭibb* (*Generalities in Medicine in Seven Books*), or *Colliget*, imparted impulses toward a reform of medical science to Renaissance physicians, who appreciated Averroës's detached and apparently disinterested attitude vis-à-vis Galen without seeing the rather reactionary Aristotelianism underlying it. In a detailed analysis of the *Colliget* chapter on respiration, Bürgel has discovered general tendencies comparable to those also present in Averroës's astronomy: a preponderantly (albeit not exclusively) speculative approach rooted in Aristotelian natural philosophy, a preparedness to sacrifice scientific progress to defend the teachings of the master, and, to a lesser extent than in astronomy, resignation in the face of technical difficulties. In the *Colliget*, health is defined in the traditional manner as an equilibrium of the four humors; accordingly, the task of the physician consists in preserving this harmony or in restoring it when it has become disturbed through illness. The physician fights the cause of an illness with its opposite: an excess of moisture with dryness, a superabundance of heat with cold, and so forth. In spite of interesting medical details, the *Colliget* is intended as a compilation of received medical wisdom rather than as an original work; but it has certainly not yet received the scholarly attention that it deserves.

The same could be said a fortiori of Averroës's handbook of Islamic law, the *Bidayat al-mujtahid wa-nihayat al-muqtasid* (*Beginning for Him Who Works Toward an Independent Judgment and End for Him who Contents Himself with Received Opinion*), a book that became a standard work of reference in the Islamic world (unlike Averroës's philosophical writings, which remained virtually unread by his fellow Muslims). The *Bidaya* aims at furnishing the reader with an exposition of the differences of opinion between the various juridicoreligious schools concerning the main points of the law. The objective is to enable the user of the *Bidaya* to come to an *ijtihād*, an independent legal judgment based on free choice among the orthodox traditions. The opinions taken into consideration

are almost exclusively Sunnite, Averroës's acquaintance with the Malikite tradition (in which he was brought up) being most profound, but he is careful to be scrupulously objective and impartial in his presentation. Brunschvig has described the *Bidaya* as the "most accomplished example of the methodical application of the principles of Islamic law to the entirety of Sunnite jurisprudence." Together with Averroës's other writings, it testifies to the versatility and greatness of an encyclopedic mind.

AVIS, HOUSE OF

Founded by Dom João, Master of the order of Avis in Alentejo, Portugal. He was the illegitimate son of Pedro I and a Galician woman, Teresa Lourenço. Born probably in Lisbon (14 August 1357) he died in the same city (14 August 1433). He acceded to the throne via the revolution of 1383–1385. On 2 February 1387 he married in Oporto Philippa of Lancaster (1359–1415), sister of the future king of England, Henry IV. Philippa was the daughter of John Gaunt and his first wife, Blanche. By Philippa João I had eight children: Duarte (1391–1438), who succeeded João I; Pedro (1392–1449), Duke of Coimbra; Henrique (1394–1460); João (1400–1442), Fernando (1402–1403), who died in prison in Fez, following the disaster of Tangier (1437); and Isabel (1397–1471). The first two died at a very early age. In 1430 Isabel married Philip the Good, Duke of Burgundy. João married his niece, Isabel (1404–1465), daughter of the first

duke of Bragança and his first wife, Beatriz. Before his marriage to Philippa of Lancaster, João I had two children by Inés Pires: Afonso, the first duke of Bragança, and Beatriz (1382–1439). She married Thomas Fitzalan, the Seventh Earl of Arundel, and moved to England. Duarte I married Leonor of Aragón in 1428. The firstborn, Afonso V (1432–1481), married Isabel, daughter of Pedro, Duke of Coimbra, and Isabel of Aragón. Afonso's sister, Joana, married (1455) Enrique IV of Castile. By Isabel, Afonso V had his successor João II (1455–95). João II married Leonor, daughter of Fernando, son of King Duarte, and Isabel, daughter of Afonso, Duke of Braganza. The accidental death of his legitimate son and heir to the throne, led João II to pass the succession to Manuel, the queen's brother.

AZARQUIEL

Abū Ishāq Ibrāhīm ibn Yaḥyā al-Naqqāsh (d. 1100), known as Ibn al-Zarqālluh or Ibn al-Zarqiyāl, was the most important astronomer of the Middle Ages in the Iberian Peninsula. He worked in Toledo under King Al-Ma'mūn (1037–1074) and later in Córdoba, which then belonged to the 'Abbādī kingdom of Seville. According to the *Yesod 'Olam* of Isaac Israeli (fourteenth century), he started his career as an instrument maker who worked for the Toledan team of astronomers led by qāḍī Sā'id al-Andalusī (1029–1070). His interest in designing new astronomical instruments appears very early. In 1048–1049 he dedicated a treatise on the *azafea* (*al-ṣafīḥa*) to the 'Abbādī prince of Seville, al-Mu'ayyad bi-Naṣr Allāh, who was then only eight or nine years old and later became king Al-Mu'tamid (1069–1091). The azafea, like the astrolabe, is an analogue computer used to solve graphically problems of spherical astronomy and astrology, but while the astrolabe needs a specific plate for each latitude, the azafea is a universal instrument that can be used for any latitude. His description on the construction and use of the instrument is extant both in Arabic and in the Spanish Alfonsine translation (*Libro de la Azafeha*). At a later date, he seems to have dedicated a simplified version of the same instrument to the same Al-Mu'tamid. This variant became very popular in medieval Europe through Latin and Hebrew translations of the treatise on its use. He also dedicated to Al-Mu'tamid a treatise on the use of the *equatorium* (ex-

tant in Arabic), another analogue computer, the purpose of which is to calculate planetary longitudes. His descriptions of the construction of such an instrument (ca. 1080–1081) and of an armillary sphere are known to us only through Alfonsine translations (*Libros de las laminas de los siete planetas, Libro de las Armellas*).

Ibn al-Zarqālluh's collaboration with qādī Sā'id and his team must have awakened his interest in observations astronomical tables, and astronomical theory. He made solar observations for twenty-five years, both in Toledo and in Seville, and he observed the moon for thirty-seven years, introducing a modification in Ptolemy's lunar model. His solar observations were incorporated to the solar mean motion tables extant in the *Toledan Tables* as well as to the solar tables of his perpetual *Almanac*. The former also include a set of "trepidation tables" (used to calculate the value of the precession of the equinoxes—then considered to be variable—for a given date), apparently related to the work of Ibn al-Zarqālluh, for he wrote, circa 1085, an important *Treatise on the Motion of the Fixed Stars* (extant in a Hebrew translation) in which he designed three different geometrical trepidation models. With them he tried to obtain results that would fit the observations made by Hipparchus (147 B.C.) and Ptolemy (139 A.D.), as well as those used by Thābit ibn Qūrra (831 A.D.) and, finally, Al-Battānī (883 A.D.) and Ibn al-Zarqālluh's own observations (ca. 1075). The same kind of historical preoccupations appears in his book on the Sun, written between 1075 and 1080 and known only through indirect sources. Its title was either *On the Solar Year* (*Fī sanat al-shams*) or *A Comprehensive Epistle on the Sun* (*al-Risāla al-jāmi'a fī-l-shams*). In it Ibn al-Zarqālluh improved enormously on the corrections made, circa 830, by the astronomers of the 'Abbasid Caliph al-Ma'mūn, in Baghdad and Damascus, on Ptolemy's solar model, and established, very accurately, that the solar apogee has a characteristic motion of 1 degree in every 279 solar years. Furthermore, a study of the different values of the solar eccentricity established by the aforementioned Hipparchus, Thābit, al-Battānī, and himself led him to design a solar model with variable eccentricity that became extremely influential in later Andalusian and Maghribī astronomy and reached Europe, where it was mentioned by Copernicus.

AZORES, THE

The Azores were likely the only great Atlantic archipelago adjacent to the Old World that was wholly unknown either to the ancients or to the medievals. The first of the group was found by the Portuguese around 1427, and the last in 1452. Their discovery, together with the (re-)discovery of the Madeiras a few years earlier, provides sure indication that by the first quarter of the fifteenth century, Portuguese navigators were able to operate hundreds of miles beyond sight of land; sailing thus was necessitated by return journeys from Africa, since the prevailing bands of northerly winds blowing down the African coast from Europe obliged navigators to turn far westward to sea in order to find southerly winds to carry them home.

The Azores were uninhabited when discovered, and the nearest, Santa Maria and São Miguel, are over seven hundred miles from the Portuguese coast. From these islands, prevailing winds blow toward the European continent; it is difficult to sail directly from Portugal toward them, as only an occasional wind blows from east to west. Hence, it is logical that their discovery should belong more to the activities involving African coastal exploration than to commerce with the northern countries of Europe itself.

The Valsequa map of 1439 is the first to show the archipelago (minus Flores and Corvo, not yet discovered) in its correct number and alignment from northeast to southwest. It bears the legend (though some maintain it was inserted later): "These islands were found by Diego de Silves, pilot of the king of Portugal, anno MCCCCXXVII." A different date is supplied by the German cartographer Martin Behaim, married to the daughter of the Captain-donatory of Fayal and Pico, in his globe of 1492: 1431. The problem is not solved by a donation of 1433 from King Duarte to his brother, the Infante Henrique, for it fails to mention the islands at all; rather, it is not until 1439 that they were included in a donation to Henrique from the regents of the young Afonso V.

This document provides the first indication of an attempt to colonize the group, for in it is stated that Henrique had already given orders to plant sheep on the seven islands then known, as a provision for eventual settlers. The first of these were next brought out to Santa Maria and São Miguel from the rural districts of central and southern Portugal by the man thought to have been the first Captain-donatory, Gonçalo Velho Cabral. In 1450, the peopling of Terceira began when the Flemish, Jacomé de Bruges brought families with him from Portugal. It is also interesting that after 1474, a number of Madeiran families emigrated to these islands. Meanwhile, around 1466, another Fleming, Jos de Utra (alias Jobst Hurter), future father-in-law of Behaim, was awarded the captaincy of the islands Pico and Fayal, and it is known that he enticed many of his countrymen to settle there. One of these, Guilherme de Silveira (alias Willem van der Haagen), quarreled with him, and then endeavored to settle two of the remaining three islands of the group, São Jorge, and the outermost Flores. Graciosa was not settled until around 1510, through the offices of Pedro Correia and Vasco Gil Sodre. Little Corvo's settlement is not dated exactly, but seems to have occurred as a spillover from Flores. In addition to Flemish immigrants, it is also known that Spaniards, Italians, French, and even Englishmen settled the islands in smaller numbers, but all were later absorbed into the local Portuguese culture.

The islands were densely wooded when discovered, and naturally, their main industry was to provide timber for continental Portugal, and for naval construction along its littoral. But soon land began to be burned off and cleared for cereal production, the islands' first large-scale industry, which then began exporting large amounts to Portugal and to Africa. Wheat continued as the islands' main export commodity throughout the fifteenth and into the sixteenth centuries—unlike Madeira, which had already switched almost wholly to sugar by the third quarter of the fifteenth century. Sugar, incidentally, was also tried in the Azores, where the climate proved less than ideal, though there are no indications as to the quantity exported. In addition, the islands grew yams and sweet potatoes, fruits of all sorts, and even pine nuts. In the sixteenth century, dyestuffs were produced, and still later, citrus products and linen.

Throughout the fifteenth and sixteenth centuries, the Azores served as the jumping-off places and havens of returning exploration; Columbus stopped at Santa Maria, while the Corte Real brothers and João Fagundes Laborador all set sail for destinations in the New World from the islands, even ships returning from Brazil and India frequently called there.

AZURARA, GOMES EANNES DE

Portuguese chronicler (ca. 1410–1473/4), the son of a cleric, Joan Eannes de Zurara, who succeeded Fernão Lopes (1380/90–ca. 1460), and had a long and distinguished career as the first official chronicler. King Duarte had created the post of *cronista-mor do reino* (chief chronicler of the kingdom) in 1434 and appointed Lopes, who had already been the keeper of the royal archives since 1418 or 1419. The decision of Duarte was motivated by his wish to have a record of the deeds of the Portuguese kings, continuing a literary tradition that dated from the fourteenth century. Fernão Lopes had worked for thirty years and was old and tired; by a decree of 6 June 1454, Afonso V appointed Azurara the keeper of the royal archives. But before the date of this appointment, probably in 1452, Lopes had already passed on to his successor the task of continuing the chronicles. Lopes seems to have rewritten a general chronicle of Portugal, beginning with the founder of the monarchy, before he produced the chronicles of Pedro I, João I, and Fernando, respectively the grandfather, father, and uncle of King Duarte. He had covered a large period of history that extended from 1357, when Pedro ascended the throne, to 1411, when João was still ruling, and had described the problems of the emergence of a national state in the throes of a conflict with Spain. Azurara was the chronicler of the Moroccan wars and of Portuguese maritime expansion. Yet whereas Lopes, writing about the past, could detach himself to a certain extent from the political questions of the day, Azurara had difficulty in avoiding his involvement in the contemporary events he was reporting.

Azurara's first work, the *Crónica da Tomada da Cidade de Ceuta* (1450), dealt with the conquest of the Moroccan city of Ceuta in 1415. It describes in detail how the idea of the Conquest was born in the courtly circle of João I. Initially the king wanted his sons to be knighted in a tournament in Portugal, but they objected to the idea and showed their interest in seeing real action in the service of God and in defense of the Christian faith, this, however, was not the only reason for his attack on the city. Azurara shows how commercial and strategic advantages were to be gained

from the expedition given the wealth and the position of the city, and ascribes to João Afonso, royal treasurer, an important role in this project; it is the latter who convinced the princes to embrace the idea when their father seemed reluctant to accept it.

The secrecy of the military preparations, which raised fears in many European cities, and the clash of opinions that divided the royal council, are described by Azurara in great detail and in such an accomplished style that it is believed that a large part of this chronicle had already been written by Lopes, or that Azurara inherited the manuscript from him and later it shaped it in his own way. Committed as he was to the values of chivalry, Azurara was able nonetheless to paint a broad picture of the different motivations that led João I to attack Ceuta, going even so far as to express veiled criticism about the violence of the assault.

In the chronicles of *Conde Dom Pedro de Meneses* (1463) and *Conde Dom Duarte de Meneses* (1468), Azurara tells the history of the Portuguese in North Africa from 1415 to 1464. João Pedro de Meneses, Count of Viana, was the first governor of Ceuta (1415–1437) and Dom Duarte (1414–1464), his illegitimate son, ruled the city in his absence (1431–1437), becoming the governor of El-Qsar es-Seghir, or Alcácer-Seguer, in the autumn of 1458. Both were loyal subjects of Afonso V. Duarte lost his life to cover the retreat of the king in one of his expeditions into Muslim territory. Azurara reports meticulously in the Meneses chronicles, in a brilliant rhetorical style, successive military operations that are extolled as feats of chivalry, relying heavily on the oral testimony of the noblemen who participated in these actions. But

for the chronicle of Duarte—Azurara's most accomplished piece of work—he went to North Africa to gather wider information, staying there from August 1467 to the summer of 1468.

With the capture of Ceuta, Muslim trade moved to other cities and the Portuguese adopted a dual policy: advance along the Moroccan seaboard and explore Africa's Atlantic coast. In his *Crónica dos Feitos da Guiné* (1453), based on the lost chronicle of Afonso de Cerveira, Azurara describes voyages along that coast and praises Prince Henrique for promoting them. He portrays also the arrival in Portugal in 1441 of the first African slaves, showing sympathy for their plight.

B

BADAJOS, TĀ'IFA KINGDOM OF See TĀ'IFA KINGDOMS

BAENA, JUAN ALFONSO DE

Juan Alfonso de Baena was a Castilian poet active during the majority of Juan II (1406–1454). He describes himself as *escribano del rey* (in effect, “royal bureaucrat”); this office in turn suggests that Baena was from a family of burghers. A snide allusion to his baptism in the verses of one of his contemporaries hints strongly that he was originally a Jew. In a long poem full of references to his literary culture he declares that he has read “*le mosines*” and in fact, his poetic practice places him in the group of Castilian versifiers in the 1410s and 1420s who are most under the influence of the Consistory of the Gay Science of Toulouse and its peninsular imitators in Barcelona and Valencia. His fame nowadays rests less on his elegant writing than on the splendid collection that bears his name, a bulky anthology of more than five hundred pieces by poets active from the 1360s to perhaps as late as the 1440s. It is hardly a systematic collection, it is simply a broad selection of verse by Castilians from this period, but certain tendencies are visible nevertheless.

The *Cancionero de Beana* contains a fair body of *cantigas de amor*, love songs in Galician, broadly on the model of the Provençal *canço*. These date from the last third of the fourteenth century, and are the work of poets such as the Archdeacon of Toro; Macías; and, eminently, the youthful Villandino. The poetry written under the impact of Toulouse, Barcelona, and Valencia represents a very different strain of Provençal influence. Galician gives way to Castilian, and the relatively simple and uniform *cantiga de amor* gives way to a variety of verse forms and genres. Within this school, if we can call it that, there are several currents. One such is a bent toward technical virtuosity. Complicated verse and stanza patterns, difficult rhyme schemes and witty figures of speech mark this mode. Also, Provençal-Castilian, so to speak, are the poetic

debates, the sets of and dialogues between two or more poets in which the respondent must follow the meters and rhymes of the initial poem. Some of these sequences are frivolous, some not. One group are of the virtuosic sort, in which the two poets put each other to the test, each obliging the other to repeat intricate stanza patterns and to find more and more obscure rhymes. The decorative tendency, within the debate poems and without, is represented by the later Villandino, Baena himself, and to a certain extent, by Fernán Manuel de Lando. Debate may also take a serious turn and deal with subjects like predestination, or the influence of the stars, or even the very truth of Christianity: certain topics of Jewish anti-Christian polemic surface in some of these pieces. The contenders themselves are a striking lot. Some are learned friars, like Fray Diego de Valencia, who spar with lay poets like Lando, who claim the right to air their own views on grave subjects, scant theology notwithstanding. A third strain in Baena's collection is the moralizing text, full of reflections on mortality, fortune, and the fall of the great, and the vanity of human life apart from God. Fernán Sánchez Talavera represents this tendency in the days of Enrique III, and the brilliant and vehement Gonzalo Martínez de Medina in those of Juan II. Finally, there is the unique figure of Francisco Imperial—Genoese, but eloquent in Castilian—the most ambitious poet of the times, who combines solemn personification allegory with echoes of Dante, and who introduces elements of *dolce stil nuovo* into Castilian poetry. One may observe finally that Baena's epigraphs—analogue to Provençal *vidas* and *razos*—often head single poems and groups of them. These provide solid information about some of his contemporaries, blatant fiction about some others (notoriously, in the case of Macías), and sometimes odd critical remarks; of a very bad poet in the collection he says, kindly, “fizo esso que sopo” (“he did as best he could”).

BALEARIC ISLANDS See MALLORCA, KINGDOM OF

BALLADS

The chronological origins of the Hispanic *romance* roughly coincide with those of traditional ballad poetry elsewhere in Europe. The first extant ballad text dates from 1421, but historical evidence points to the composition of romances as early as the first third of the fourteenth century.

The typical meter of Hispanic ballads involves a sixteen-syllable verse divided into two eight-syllable hemistichs, with assonant rhyme in the second hemistich, though some narrative poems in other metrical schemes (parallel assonant octosyllabic couplets; six-syllable *romancillos*) are also admitted to the *romancero* (the Hispanic ballad corpus). The typical ballad verse is based on the anisosyllabic meter (usually six to nine syllables) of medieval Spanish epic poetry, a number of whose narratives are still fragmentarily represented in handwritten and printed ballad texts from the fifteenth and sixteenth centuries and, in some cases, continue to be known in the modern oral tradition. The first ballads undoubtedly started as fragments of medieval epic poems; non-epic historical events soon came to be narrated in the same verse as the newly independent epic fragments; early on, numerous ballad narratives from continental Europe, especially France, were retold in *romance* meter; the early Hispanic lyric also played an important role in the formation of the *romancero*. The genre's beginnings and later development are marked by its notable capacity to absorb and adapt narrative and poetic materials of the most diverse origins.

Typically, Hispanic ballads are relatively short, usually involving some twenty to one hundred verses, except certain early minstrel ballads (*romances juglarescos*), which may have as many as one thousand verses. The narrative is usually compact, well-structured (sometimes embodying ring composition), and frequently involves a dramatic confrontation between protagonist and antagonist. Sometimes, as a reflection of its origins as a fragment of an earlier epic, a ballad may be fragmentistic in character, beginning *ex nihilo* and ending before the action is resolved. Ballad style is allusive, rather than descriptive, calling upon our intuition to participate in the poetic process and supply

details only hinted at by the ballad's minimalist approach. The oral tradition—of whatever epoch—involves a dynamic, creative process in which ballad texts are, over time, incessantly remodeled by their singers in accord with the developing value systems of a changing society.

The romance originated in Castile—also the homeland of the epic—but by the 1400s had already spread to the farthest reaches of the Iberian Peninsula, being sung in Galicia and in Catalonia. Ballads were first printed in broadsides (*pliegos sueltos*) in the early 1500s and by midcentury were being abundantly anthologized in *cancioneros* (song books) and *romanceros* (ballad collections). From the late 1400s on, ballad meter came to be used by learned as well as oral poets. Before 1580, the printed corpus is dominated by medieval narratives drawn from oral tradition (*romances viejos*); after that date, erudite compositions attest to the popularity of new ballads (*romances nuevos*) composed by learned authors. In the seventeenth century, the *romances viejos*, once known and sung at all levels of society, fell out of favor, were gradually relegated to peasant villages and mountain hamlets, and ultimately came to be unknown in learned circles. Only with the advent of Romanticism, with its interest in popular traditions and the distinctive character of national cultures, did the Hispanic traditional ballad come to emerge from its latent condition (*estado latente*) and be recognized as the heir to an oral tradition going back to medieval times.

Thanks to the initiatives of the great Spanish scholar Ramón Menéndez Pidal and his followers, Hispanic ballads have now been collected from essentially all areas where Spanish, Portuguese, Catalan, and Judeo-Spanish are spoken today, including some of the most isolated and "exotic" areas of the Hispanic world. This Pan-Hispanic character of the *romancero* is one of its essential features. It also leads to the inescapable conclusion that no study of Hispanic ballads can be considered complete without taking into account all known evidence from every modern geographic subtradition, together with the complex testimony of variegated early witnesses: not only manuscripts, *pliegos sueltos*, and *cancioneros*, but also early book lists, poetic medleys (*ensaladas*), glosses, guitar manuals (*vihuelistas*), literary allusions, proverbial expressions, pen trials, contrafact hymns and songs, religious adaptations (*romances a lo divino*), citations in Golden Age dramas and interludes (*comedias*; *entremeses*). The comparative study of such early evidence, together with texts recorded from modern oral tradition, obliges us to conclude that the latter are essentially independent from those texts that happened to have been copied or printed in the fifteenth and sixteenth centuries. What was written down reflects a highly selective, es-

entially distorted view of the early tradition. Though a few modern versions do derive directly (or indirectly) from early printed sources, the normal (now almost predictable) relationship between the tradition's two chronological segments is that the modern versions will often reflect lost medieval variants, which, in one or more essential features, may turn out to be quite different from those arbitrarily chosen by early copyists or sixteenth-century printers. The modern tradition is, then, an independent witness to the romancero's medieval origins and is essential to any comparative study and especially to the task of reconstructing the Hispanic ballad's earliest stages.

Space permits us to mention here only a few of the medieval narratives re-created in ballad form, excluding, in the case of epic and historical romances, secondary compositions based on historiographic sources. (For details concerning each title, see Armistead's *Catálogo-índice* and/or Menéndez Pidal's *Romancero hispánico*.) All the major national epics are reflected in the early ballad tradition: *Bernardo del Carpio*, *Fernán González*, *Infantes de Lara* (*Lords of Lara*), *Mocedades de Rodrigo* (*The Cid's Youthful Adventures*), *Partición de los reinos* (*Division of the Kingdom*), *Cerco de Zamora* (*Siege of Zamora*), *Jura de Santa Gadea* (*Oath at Santa Gadea*), and *Cantar de Mio Cid* (*Poem of the Cid*); of these, *Bernardo*, *Mocedades*, *Partición*, and *Mio Cid* can still be heard, at least fragmentarily, in the modern tradition. Many Old French epic poems were adapted by medieval Spanish minstrels (*juglares*) and eventually evolved into Hispanic ballads (here French titles are followed by those of related ballads): *Flovent/Floresvento*; *Mort Aymeri de Narbonne* (*Death of Aymeri*)/*Almerique de Narbona*; *Ogier le Danois/Roldán al pie de la torre* (*Roland at the Base of the Tower*); *Enfances de Charlemagne* (*Charlemagne's Youthful Adventures*)/*Galiana*; *Chanson de Roland/Roncesvalles*, *Guarinos*, *Don Beltrán*, *Sueño de doña Alda* (*Lady Alda's Dream*); *Aïol/Montesinos*; *Aye d'Avignon/Moriana y Galván*; *Beuve de Hantone/Celinos*. All themes mentioned here have survived somewhere in the modern tradition and, in the case of *Floresvento*, *Roldán al pie de la torre*, *Galiana*, and *Celinos*, the only surviving evidence comes from modern texts.

Some Hispanic ballads can be traced—ultimately—to Germanic origins: *Gaiferos y Melisenda* derives—doubtless through a lost Old French intermediary—from the same narrative represented by the medieval Germano-Latin *Waltharius* and the Anglo-Saxon *Waldere*, while *Don Bueso y su hermana* (*Bueso and his Sister*) agrees—down to some minor details—with the Middle High German *Kudrunslid*, though it undoubtedly does not derive directly, but

through some lost balladic intermediary. Numerous events from medieval Spanish, Portuguese, and Catalan history were retold in ballad form, ranging from the earliest known historical narrative, *El prior de San Juan* (*The Prior of St. John*), probably composed around 1328, up to *La muerte del príncipe don Juan* (*The Death of Prince John*), which occurred on 6 October 1497. Of the latter, we knew only modern versions until 1991, when an early text was uncovered in a sixteenth-century manuscript. There are various classical narratives in medieval garb: *El juicio de París* (*Paris's Judgment*) and *El robo de Elena* (*Abduction of Helen*) are certainly based on medieval Troy narratives. *La muerte de Alejandro* (*The Death of Alexander*), already cited in 1492, reflects the Alexander legend. *Virgilio*, which sees Virgil as a womanizer, follows the medieval tendency to scandalize the author of the *Aeneid*. Some ballads are inspired by medieval adventure romances: *Espinelo* (*The Thorn Bush Foundling*) tells a story similar to Marie de France's *Lai del Freisne* (*Story of the Ash Tree*), while *Hermanas reina y cautiva* (*Two Sisters: Queen and Captive*) ultimately follows *Flore et Blanchefleur*. Arthurian stories are sparsely represented: In *Ferido está don Tristán* (*Tristan is Wounded*), known only in early texts, Iseult, weeping, goes to the hero's deathbed, with surprising results. *Lanzarote y el ciervo del pie blanco* (*Lancelot and the White-Footed Stag*), known in a sixteenth-century version, has been discovered in the oral tradition of Almería, Jaén, and the Canary Islands.

The earliest surviving ballad text is that of *La gentil dama y el rústico pastor* (*The Noble Lady and the Rustic Shepherd*), a sort of bawdy *pastourelle* in reverse, which was written down in a mixture of Castilian and Catalan, by a Mallorcan law student in Italy in 1421. The ballad is still sung by eastern Mediterranean and North African Jews, and in a form very close to that recalled by the fifteenth-century copyist. The Galician author, Juan Rodríguez del Padrón (d. 1450), transcribed and adapted to his courtly purposes three ballad texts taken from oral tradition: *El caballero burlado* (*The Baffled Knight*), *Rosaflorida y Montesinos*, and *Infante Arnaldos* plus *Conde Olinos* (*Prince Arnaldos; Count Olinos*), which are included in the *Cancionero de Londres*. All four themes have been collected from the modern tradition. *Blancaniña* (*The Unfaithful Wife*) is based, by way of a *chanson populaire*, on a medieval French *fabliau*: *Le chevalier à la robe vermeille* (*The Knight of the Red Cloak*). *La bella en misa* (*The Beauty in Church*) follows a medieval Greek ballad learned during the Catalan occupation of Athens (1311–1388) and thence taken back to Spain. *La vuelta del marido (é)* (*Husband's Return: é* assonance), sung today all over the Hispanic world, derives from a fifteenth-century French *chanson*. *Gritando va*

el caballero (*The Weeping Knight*), still sung in Morocco and Extremadura, continues to echo a courtly, sentimental romance, composed in the late 1400s. The Hispanic ballad repertoire thus offers us a substantial and variegated corpus of medieval narratives that have survived and creatively evolved through seven centuries of living oral tradition.

BALLADS, MUSIC

Musically speaking, the Hispanic *romancero* ballad's hemistichs were sung to a reiterated melodic distich (AB) or to the more popular quatrain strophe (ABCD, less frequently AABB, ABCA), at times with added refrains or with interjections interpolated either between phrases or within lines. There are numerous examples of ballads representing different textual themes that share the same tune and ballads that share the same textual theme which are sung to different tunes. The tunes' medieval elements are reflected in the modes (mainly Dorian and Phrygian), together with their plagal forms, and in distich strophes comprising *ouvert* and *clos* cadences, respectively, which probably emanated from the Old French *chanson de geste*. Similar is the practice of *lexapren*, wherein the final verse of a quatrain strophe is repeated in the initial verse of the succeeding one. This was known in the Iberian Peninsula as *dexaprende*, *copla encadenada*, or *canción de coleo*.

It is generally agreed that ballads have been sung since the early fourteenth century. Yet, taking into ac-

count the thousands of romance texts that were subsequently printed in *pliegos sueltos* (chapbooks or broadsides) and in songbooks (*cancioneros*) dating from the sixteenth and early seventeenth centuries, it is unfortunate that their melodies were not included, particularly in those collections where specimens were probably taken directly from oral tradition.

Be that as it may, the anonymous four-part setting "Lealtat, o lealtat" from the *Crónica del Condestable Miquel Lucas de Iranzo* (1466; Madrid, Bib. Nac. MS 2092), which for long was thought to be the oldest notated romance, is nothing more than a praise song ("Versos fechos en loor del Condestable"), whose four textual strophes are written in ballad meter (see example 1).

Example 1: Lealtat, ¡O lealtat! (tiple of a4)
Madrid: Bib. Nac. MS 2092 (olim G. 126), fols. 234v-235.

Le - al - tat, ¡O le - al - tat!

Le - al - tat, di - me do - stás?

Ve - te Rey al Con - de - sta - ble

y en el la fa - lla - rds.

Also questionable is the so-called ballad "Olvida tu perdición" (fol. 71^v), in the *Cancionero musical de la Biblioteca Colombina* (ca. 1490), whose two-verse fragment commemorating the fall of Granada in 1492 inspired a three-part setting by an anonymous composer that was added much later to the original compilation. Thus, one must turn to the *Cancionero musical de Palacio* (CMP) for the earliest ballad melodies.

The magnificent CMP (compiled c. 1490–1520) was discovered, in 1870, in the library of the Royal Palace (Madrid), by the bibliophile Gregorio Cruzada Villaamil. Two decades later, his friend Francisco Ansejo Barbieri published a critical edition. Though the original index listed forty-four romances among its 458 compositions, there are actually only thirty-three, including the ballad "Setenil, ay Setenil," which lacks music. Judging from their texts, thirteen are traditional and twenty are *culto*. Their composers, apart from the fifteen who remain unidentified, include Juan de Anchieta, Antonio de Contreras, Juan del Encina, Pedro de Lagarto, Lope Martines, Francisco Millán, Antonio de Ribera, and Francisco de la Torre. Whereas Barbieri advocated an entirely vocal rendering of the CMP's ballad settings, Higinio Anglés, in his two-volume edi-

tion of the music (Barcelona 1947–1951), countered that the untexted vocal parts accompanying the *superius* (or *tiple*) were designated for instruments. Only in three instances does Anglés concur with Barbieri: “Dormiendo está el cavallero” “Mi libertad en sosiego” and “Por mayo era, por mayo” (see example 2), thus exhibiting the earliest examples that were sung a cappella. Barbieri did not follow the original order of the *CMP*’s compositions, whereas Anglés did. The ballad tunes (assigned to the *superius*) reveal such common features as strophic form (quatrain, ABCD), although “Por mayo era, por mayo” is, in reality, a distich (AB); balanced musical phrases, except for the more extensively ornamented cadences, ending on a sustained cadential tone (indicated by a fermata); restricted range (no less than a sixth, but not greater than an octave); melodic progressions are, for the most part, diatonic; meter is predominantly duple; and the tune-text relationship is basically syllabic, except for the cadences in the second and final phrases. The Dorian and Mixolydian modes prevail.

Example 2: Por Mayo era, por Mayo (Tiple I of a4)
Madrid: Bibl. Real, sign. 2-I-5, fols. 56v-57.

Por Ma-yo e-ra por Ma - - yo,
cuan-do fa-ce las ca-lo - - res
cuan-do duen-nas y don-ce - - las
cuan-do los quees-tan pe-na - - dos
to-das an-dan con a-mo - - res
van ser-vir a sus a-mo - - res
con a mo - - res
sus a mo - - res

While the singing of ballads continued to be in vogue in court circles, it is surprising that, during the period of the *vihuelistas* (1536–1576), only twenty-two ballad texts were arranged for voice and *vihuela*, while the equally popular *villancico* is represented by eighty settings. With regard to ballads, Luis Milán contributed four, Luis de Narváez two, Alonso de Mudarra three, Enríquez de Valderrábano five, Diego Pisador

five, Esteban Daza one, and Juan Bermudo one. Among them, Miguel de Fuenllana contributed three (two of which are intabulations of settings by Crístobal Morales and Francisco Bernal, while his own setting of “Paseábase el rey moro” was written for the guitar). In addition, Luis Venegas de Henestrosa included, in his collection of tunes, three ballad settings for voice, keyboard instrument, harp, and vihuela, two of which were attributed to Francisco Palero, and the third to an anonymous composer. Multiple settings can be found for such popular ballads as “A las armas moriscote” (Pisador, Fuenllana, the latter based on an intabulation of Bernal), “Paseábase el rey moro” (Narváez, Pisador, Fuenllana, and Palero), and “Mira, Nero de Tarpeya” (Bermudo [see example 3] and Palero).

Example 3: Mira, Nero de Tarpea
Juan Bermudo, *Declaración de instrumentos musicales*
(Osuna, 1555), Book IV, fol. 101,

Mi-ra, Ne-ro de Tar-pe-a
a Ro-ma-co-mo se ar-dí-a
co-mo se ar-dí-a;
gri-tos dan ni-fios y vie-jos,
Yel de-na-da se do-li-a

The traditionality of the tune utilized by Valderrábano for “Los braços traigo cansados” *La muerte de don Beltrán* is confirmed in the settings of Millán (*CMP*), Francisco de Peñalosa (*Cancionero musical de Barcelona*), and in the singular ballad setting (a4) of Juan Vázquez in his *Recopilación de Sonetos y Villancicos* (see example 4).

Ex. 5: Los braços traigo cansados

Peñalosa (ca. 1500)
Los bra-sos tra-yo
Millán (before 1520)
Los bra-ços tra-yo can-sa-dos etc.
Valderrábano (1547). Despacio
Los bra-ços tray-go can-sa-dos, can-sa-dos etc.
Vázquez (1560)
Los bra-ços tray-go can-sa-dos etc.

The melody for “Durandarte, Durandarte” (in the *CMP*) was also used by Milán. Moreover, the famous “Conde Claros” tune adapted by Narváez as a *cantus firmus* for his *diferencias*, was subsequently taken up by Mudarra, Valderrábano, Pisador, and by an anonymous composer in the collection of Venegas de Henestrosa. The tune, notated as a trichordal (see example 5), was cited in Francisco Salinas’s *De Musica Libri Septem* (Salamanca, 1577, libro VI, 342), along with four other ballad melodies (“Pensó el mal villano,” “Yo me yua mi madre,” “En la ciudad de Toledo,” and “Retraída está la Infanta”).

* = modified

The *Cancionero de Sablonara*, which included settings of forty-seven ballad texts from the late sixteenth and early seventeenth centuries, marked the transition to a new stage in the development of Spanish balladry. Its texts comprise erudite poems in ballad meter written by learned Golden Age authors. This generic innovation, known as the *romancero nuevo*, lies outside the medieval purview of the present entry.

Although the Romantic movement of the nineteenth century revived national interest in the living oral tradition, manifesting particular interest in ballad text types of medieval origin, the tunes appearing in Romantic collections exhibit hardly any traces of medieval musical elements, save perhaps in formal structure and modality. Subsequent fieldwork by modern Spanish and American scholars has revealed that the romance is an essentially pan-Hispanic phenomenon that has survived from the Middle Ages down to the present, in practically all areas where Spanish, Portuguese, Catalán, and Judeo-Spanish are spoken today. The complex problem of the possible medieval antecedents of this vast musical repertoire remains to be explored.

BANKING

From the eleventh century, there were money changers in the most active cities in Aragón (Jaca, Zaragoza), Catalonia (Barcelona), and Castile (villages on the way to Santiago de Compostela). In the twelfth century, the private banking in Catalonia evolved on Christian and Jewish money changers and moneylenders’ hands, who invested their earnings in banking business, allowed deposits, opened current accounts with or without coverage, and earned interest at a rate of 12.5 to 25 percent. The count of Barcelona, Ramón Berenguer IV, perhaps counseled by the Templars, authorized (1150) his Christian subjects from Lérida to lend at interest. This privilege was confirmed by Jaime I in October 1217; but the development of trade in the kingdom of Aragón and the need of money caused the *tabelliones* (bankers) from Girona and Besalu to increase their interest rate to over 20 percent. The existing variety of coins, the fluctuating prices, and the search of a profit (*logro*) higher than what was allowed helped private banking to develop and impelled Barcelona to adopt its peculiar silver mark (*marca*; 327 gm.) in the first third of the thirteenth century.

In Castile, there were also public money changers, in fairgrounds such as Medina del Campo or in cities such as Cuenca or Seville, who were permitted to have their own wood bench, their balances to weigh gold and silver, and their account books. They could lend money on the condition that the interest did not double the loaned capital in a year; but the irresponsibility of many of them and speculation caused the first bankruptcies, fraudulent (by transferring the money to a third person by means of bills of exchange) or not, and gave rise to the first banking laws in the courts of Barcelona in February 1300 and in the courts of Lérida in March 1301, in which heavy penalties (exile, disqualification, loss of properties, and life sentence) were imposed on infractors, and changers and bankers were

obliged to pay bail. In Barcelona, there were thirty-three private banks between 1301 and 1349.

After 1350, in all the Spanish kingdoms, the shortage of money and the bankruptcy of some money changers, with many debts, caused those who had surplus and were afraid of saving it at home to leave the money as a deposit in a solvent monastery or church on certain conditions, and some Castilian *conse* (councils or municipalities) controlled the profession of money changer by reducing the number of money changers authorized, but the king granted the practice of public money exchange to a privileged individual who sublet or transferred it to a professional (Jew or Christian), which roused social unrest.

From 1381 to 1383, there were spectacular bankruptcies of money changers, who had lent to the crown, in Barcelona, Girona, and Perpignan. In 1397 the municipality of Barcelona reorganized the profession of money changer–banker by obliging to deposit a high sum as an insurance, to rent a bank of credit in the exchange, where money changers were concentrated.

The municipality of Barcelona, on 25 January 1401, opened the first bank of deposit and public credit in the city warranted by the municipality, which was called *taula de canvi*. This bank became the executive agent of the Generalitat and was soon imitated in Palma de Mallorca (1401), Valencia (1407), Zaragoza, Girona (1443), Vic, Perpignan, Cervera (1559), and other cities, with varying luck because of the problems created by the large number of loans given to public organizations and the subsequent shortage of liquidity. In Barcelona, there are still private bankers forced to insure themselves to avoid fraudulent liquidations. The *taula de canvi*, which had 1,460 clients in 1433 and more than 600,000 pounds as a deposit in 1462, had to face the floating public debt and the interests of the consolidated public debt; whereupon, during the fifteenth century, it had to be restructured on several occasions. The banks of Barcelona produced half the finances of Catalonia.

The *taula de canvi* of Valencia operated from 1407 to 1416 and renovated its activities in 1519. The period from 1416 to 1519 was occupied by private banking. The cortes of Castile, in Madrid in 1445 and in Toledo in 1446, liberalized changes by allowing private banking to thrive again in the fundamental urban settlements in Castile and Andalusia (Jerez, Burgos, Baeza, Seville, Valladolid, Segovia, Madrid, Córdoba, Toledo, and Santiago de Compostela from 1450 to 1550). The new changers-bankers paid the deposits demanded by the city councils of the places where they were going to work. The rules about discounts or commissions were minimal (1488–1498), except for expressly forbidding foreigners to practice banking to save high-

priced coins from going abroad. At the end of the fifteenth century, only twenty-four private banks operated in Barcelona besides the municipal *taula*.

BANŪ ʿABBĀD

The Banū ʿAbbād clan traced its ancestral origins to Yemen via a progenitor who came to al-Andalus in the 740s. Lords of Seville, they were by far the most powerful of the dynasties that formed the tāʾifa kingdoms in eleventh-century Iberia. Ibn ʿAbī ʿĀmir (al-Manṣūr) had appointed his kinsman Ismāʿīl, a judge in the city during the latter part of the tenth century. Ismāʿīl was known as a man of probity who attempted to keep peace among the quarreling Berbers. In old age, Ismāʿīl passed down his office to his son, Muḥammad, who founded the ʿAbbādid Dynasty.

When Muḥammad inherited his father’s office, he also inherited great wealth and vast tracts of land in and around Seville. At the time, he was said to be the wealthiest man in the region. He became governor of the city in 1023, when al-Qāsim was overthrown, and he formed part of a three-man council entrusted to oversee the city’s administration. Shortly thereafter, he was asked to assume full power. During the nearly twenty years he ruled he was able to establish an autonomous state with a volunteer army composed of Arabs, Christians, and Berbers. During this period, he orchestrated an elaborate ruse by claiming that the deposed caliph, Hishām II, was alive and living in Seville, and that he was merely his servant. An impostor was clothed in caliphal robes and would conduct Friday prayers at the mosque while Muḥammad acted as his chamberlain. In 1035, Muḥammad asked all the provinces to swear an oath of allegiance to Hishām II, the legitimate caliph. Some cooperated, others ignored the request, and still others encountered problems with it. To castigate one of the dissenters, the Berber governor of Málaga, Muḥammad killed him and occupied Carmona. Afterward, Muḥammad attacked Almería, whose ruler sought an alliance with the Berbers of Granada. Muḥammad’s son Ismāʿīl was killed in a military campaign against them.

When Muḥammad died in 1042, he was succeeded by his second son, Al-Muʿtaḍid. Al-Muʿtaḍid was an astute, determined, and often ruthless individual who was successful in extending his influence over fellow Mulims in Portugal, Huelva, Algeciras, Ronda, and Carmona. He was, however, compelled to pay large tributes to the Christians, who by 1056 had made significant advances in the south, particularly Fernando I, who attacked Seville in 1063. Dissatisfied with the title of chamberlain inherited from his father, in 1059 Al-Muʿtaḍid declared that Hishām II, the pseudo-caliph invented by Muḥammad, had died. He assumed full power as king. Full of contradictions, Al-Muʿtaḍid was capable of killing his own son for suspicion of treason and liquidating guests as they bathed in his palace as well as writing delicate poetry, appreciating music, and administering the state. Suspicious and greatly feared by his children, he chose carefully the one who would succeed him, the future Al-Muʿtamid, whom he appointed chamberlain, commander of the army, and governor of Silves.

Al-Muʿtamid assumed the throne in 1068. He was both tragic and magnificent, a man who would know both the heights of majesty and the depths of abjection during his life. When he assumed the governorship of Silves in 1063, Al-Muʿtamid was accompanied by his lifelong friend and close companion, Ibn ʿAmmār. When Ibn ʿAmmār later betrayed al-Muʿtamid and fled to Zaragoza, Al-Muʿtamid pursued him, seized him, imprisoned him, and then killed him with his own hands with an ax blow to the head. Although capable of exacting cruel vengeance, al-Muʿtamid is best known for his luxuriant poetry, especially the moving verses in which he records the love for his wife, Iʿtimīd al-Rumaykiyya, a former slave girl whom he encountered first on the banks of the Guadalquivir River. The worst chapter of his life, however, unfolded as a result of an error in his own judgment. Fearing the Christian inroads in the south, he succumbed to calling for aid from the Almoravids in North Africa. Instead of delivering him from his Christian enemies, however, the Almoravid emperor Ibn Ṭāsfīn would take his kingdom, and that of all the other ṭāʾifa kings, and lead al-Muʿtamid away from his beloved Seville into exile in Morocco, in chains and in humiliation.

The Banū ʿAbbād of Seville.

Muhammad (1023–1042)
al-Muʿtaḍid (1042–1068)
al-Muʿtamid (1068–1091)

BANŪ DHŪ-L-NŪN

The Banū Dhū-l-Nūn was a Berber clan that appeared in al-Andalus during the last years of the caliphate. The members of the clan established themselves near Toledo. Some of them held important positions in the army and the government during the regime of al-Manṣūr and his successors. Ismāʿīl, the first Dhū-l-Nūnid ruler of Toledo, seems to have been governor of the city and shared power with Abū Bakr al-Ḥadīdī at the time of the revolts during the first and second decades of the eleventh century in Córdoba, immediately following the unraveling of the caliphate. A well-respected citizen, Al-Ḥadīdī remained a close adviser to Ismāʿīl long after he became king in 1016 and continued in the same capacity under Yaḥyā, Ismāʿīl's son and successor. Yaḥyā proved a skilled diplomat who managed to play all external interests against each other and survive the perils presented by both his fellow Mulims in al-Andalus and the encroaching Christians from the north. When menaced by the Banū Hūd of Zaragoza, Yaḥyā forged an alliance with Fernando I of Castile and León and, at one point, even offered refuge in Toledo to the future Alfonso VI, who would take the city from Yaḥyā's grandson and send the latter to Valencia in 1085. Yaḥyā allied himself closely with the ʿAbbādis of Seville and cooperated with Muḥammad I of that city by turning a blind eye to his ruse and recognizing the man Muḥammad said was Hishām II as the living caliph. The fate of Córdoba, however, soon put the Dhū-l-Nūnid at odds with the Banū ʿAbbād, just as they were at war with the Al-Aḥṣas of Badajoz. Despite these tensions, however, Yaḥyā's reign was distinguished by grandeur and abundance. It was only after his death in 1075 that the kingdom's circumstances began a steady decline. Yaḥyā was succeeded by his grandson, known as Yaḥyā "el Nieto," who lacked the maturity and finesse to deal with the difficult political situations arising from governing on the frontier. Yaḥyā el Nieto dismissed Al-Ḥadīdī, who had been a key adviser to both his grandfather and great grandfather, and other ministers who objected to Alfonso VI's extortionary demands for tribute. Tensions rose. Finally, amid internal rebellions in the city and pressure from the Banū Hūd of Zaragoza from the east, Alfonso VI from the north, and the Al-Aḥṣas of

Badajoz from the southwest, amid an insurrection that closed off nearly every exit from Toledo, Yaḥyā el Nieto was compelled to abandon the city when the Al-Afṭas attacked in 1079. Faced with an impossible situation, he turned to Alfonso, the lesser of the evils, who easily regained Toledo for him. In 1085, however, with the concurrence of Al-Mu'tamid of Seville, Alfonso decided the city was for him and himself alone, expelling Yaḥyā el Nieto and sending him to Valencia as its ruler. Alfonso's decision sealed Toledo's fate. It had fallen permanently into the hands of the Christians. The capitulation of Toledo sent a shockwave through al-Andalus and it would ultimately lead to the involvement of the Almoravids from North Africa in Iberia. The Almoravids would be called in at the instigation of Al-Mu'tamid of Seville and others to rescue them from the encroachments of Alfonso VI and the ambitious Christian rulers of the peninsula. Rather than provide redemption, however, the Almoravids took power for themselves, deposed the most assertive of the tā'ifa kings, and sent them packing into exile to Morocco in chains.

The Banū Dhul-Nun Dynasty of Toledo (1016–1085).

Ismā'īl (1016–1043)

Yaḥyā (1043–1075)

Yaḥyā "El Nieto" (1075–1085)

BANŪ HŪD

The clan of the Hūd ruled Zaragoza from 1040 to 1142. They were the descendants of the Tjībids, a clan with Syrian Arab origins that had established itself in the region in the latter part of the ninth century. They became independent during the revolt in Córdoba following the dissolution of the caliphate. The founder of the dynasty was Sulaymān al-Musta'in, descendant of an Arab named Hūd who came to al-Andalus at the time of the Conquest. In 1039, taking advantage of the chaos in Córdoba, he took control of Lérida and Monzón and acquired jurisdiction over Huesca, Tudela, and Calatayud. At war with the Dhū-l-Nūn of Toledo in the 1040s, he sought alliances with the Christians. Sulaymān divided his kingdom among five sons, all of whom quarreled over their rightful share. Aḥmad al-Muqtadir, who emerged victorious, added Denia to the

realm and became very powerful among the tāi'fa kings. Aḥmad was renowned as a builder and for many public works. Muḥammad, his son and successor, defended the integrity of the kingdom and challenged al-Mu'tamid of Seville by giving refuge to Ibn 'Ammār, the king of Seville's enemy and former companion. At the same time, the Castilian Christian Rodrigo Díaz de Vivar, known as El Cid, served as a mercenary in Muḥammad's army and helped protect the kingdom against Christians and Muslims alike. Muḥammad's follower, Aḥmad II, failed to withstand Christian abuse and suffered a resounding defeat at Huesca in 1108, where he died. Despite this blow, the Banū Hūd preserved their independence until 'Abd al-Malik allied himself with the Christians and provoked the Almoravids to occupy Zaragoza. The Almoravids, however, allowed Aḥmad III to continue as king until 1118, when Alfonso I and Ramiro II of Aragón entered the kingdom and deposed him.

BANŪ QASĪ

A turning point in the slow process of the Reconquest of the eighth and ninth centuries was the liberation of Barcelona in 801 by Christian forces (Visigoths and other Spanish Christian emigrants) under the orders of Louis the Pious of France. They continued south as far as Tarragona (808). These newly captured regions constituted the so-called (mostly fictitious) Marca Hispanica. However, the Muslims attacked Barcelona again in 813 and 815, and the rebellion of Mūṣa b. Mūṣa of Zaragoza against 'Abd al-Raḥmān II (842) marked the emergence of the powerful Banū Qasī clan, supposedly descended from an early Christian count. Mūṣa's son Fortún succeeded him in Tudela (d. 874), and another son, Lubb, succeeded him in Zaragoza, where the dynasty continued until 929. The rebellion of Mūṣa was providential for Asturias, besieged by Muslim invaders and plagued by a quarrel of succes-

sion upon the death of Alfonso II. They apparently assisted Mūṣa, and he was able to withstand the attack of the Muslim ruler against him in Navarre, where he established an independent kingdom in 852.

According to Ibn Ḥazm, Fruela II (d. 925) of León, son of Alfonso III of Asturias, married a woman of the Banū Qasī named Urraca (apparently a convert to Christianity).

BARBASTRO, CRUSADE OF

In 1064 a large army of Aquitanians, Burgundians, Normans, and Catalans laid siege to the Muslim fortress of Barbastro in the kingdom of Zaragoza. After forty days the city surrendered and there ensued a massacre of the Muslim inhabitants. In the short run it was of no great consequence, for in 1065, nine months after the siege, the Muslims reconquered the city after most of the foreign knights had departed.

The siege of Barbastro is, for several reasons, one of the most controversial battles of the early reconquest in Spain. Historians of the Crusades and the Reconquest have struggled with several problems, including the indulgence letter that Pope Alexander II allegedly granted to the soldiers at Barbastro, and whether this makes Barbastro the First Crusade, preceding the one called by Pope Urban II. In addition, the extent of involvement by Pope Alexander II, from 1061 to 1073, and the Cluniacs in propagating the Crusade has been debated, as has the identification of the leader of the Christian soldiers, among whom we find as candidates Duke William VIII of Aquitaine, William of Montreuil, the Norman Robert Crispin, and Armengol III, count of Urgel.

The controversy concerning the papacy is based upon a translation of a passage in the chronicle (1067–1076) of Ibn Ḥayyān, an eleventh-century Córdoba writer. Some have argued that Ibn Ḥayyān indirectly identified the leader of the armies at Barbastro when he referred to the "commander of 'Ar-Rum." Most scholars suggested that the leader of the Barbastro campaign was handpicked, so to speak, by Pope Alexander II. Recent scholarship demonstrates "'Ar-Rum" was employed by the Muslims to identify Castilians, Galicians, Catalans, Aragónese, and even adver-

saries outside the peninsula; therefore, it does not refer specifically to a leader chosen by or coming from Rome.

There is no evidence to suggest that the peninsular kings ever needed or called upon the Cluniacs to invite foreign armies to Barbastro. The active participation of Pope Alexander II simply eludes us at every turn. The pope issued a bull allegedly directed to the knights at Barbastro, but it is addressed to the *clero Vulturnensis*, whose exact identity is unclear. Neither the leaders nor the name of Barbastro are mentioned specifically in Alexander's bull. For these and other reasons, Barbastro cannot be called a bona fide "crusade," but it was indeed a "holy war." A major problem has been the identification of a single leader at Barbastro. Sources such as the *Chronica de Saint Maxentii, Historiae Francicae Fragmento*; Amato of Monte Cassino; *Gesta Comitum Barcinonensium*; Ibn Ḥayyān; and al-Bakri are governed by regional interests and personal bias. They each focused upon the specific roles of the various leaders, both foreign and domestic. At the "crusade" of Barbastro there were apparently multiple leaders, the most prominent being Duke William VIII of Aquitaine, Robert Crispin, and Armengol III, Count of Urgel. It has been decisively demonstrated that William of Montreuil did not participate at Barbastro.

In the long run, the role of foreign soldiers was of greater utility for the reconquest of the Iberian Peninsula. When the foreign knights returned to their own lands, they told of the fame and fortune to be had south of the Pyrenees. After Barbastro there is a marked increase of foreign soldiers, especially Normans, in the Iberian Peninsula. These later Normans were there for more than booty. Some even attempted to establish their own kingdoms in the peninsula. Although the soldiers at Barbastro could not know it, the battle would serve as a propaganda piece to lure others to seek fame and fortune in the Reconquest.

BARCELONA, CITY OF

Barcelona emerged as the political and economic capital of northeastern Iberia during the Middle Ages. Previously, the Greek city of Emporion (along the coast to the north of Barcelona) and Roman Tarragona had

served as administrative centers. In the Roman period “Barcino” was important but secondary. Its growing significance after the collapse of Roman rule was due to its economic and military position given the circumstances of the Muslim-Christian military balance from 800 to 1150.

Barcelona would be a major port in the medieval and modern Mediterranean but its prominence in this regard cannot be attributed to natural advantage. Its harbor was neither sheltered nor convenient to moor boats. Guarded by hills on three sides, Barcelona was well-protected from a land attack and was further bolstered by the survival of its immense Roman walls. The military benefits of Barcelona’s situation became especially important after the Carolingian reconquest in 801, which left Tarragona a deserted city between Christian and Muslim zones. Tarragona would not be reoccupied successfully until the twelfth century, although it remained the titular ecclesiastical metropolis. Barcelona was conveniently near the military frontier but usually safe from attack. A notable exception took place with the sack and burning of the city in 985. Muslim forces also overran Barcelona on two earlier occasions.

With the eclipse of direct Carolingian rule in the later ninth century, Barcelona became linked to the fortunes of its count, one among a related group of Pyrenean successors to Carolingian authority. The success of the count of Barcelona in dominating and ultimately annexing his neighbors paralleled the rise of the city.

The destruction of Barcelona in 985 by the troops of Al-Manṣūr proved a paradoxical disaster. It was the last gasp of the caliphate’s power and ushered in a period of urban expansion. In the eleventh century the growth of Barcelona was based on agricultural prosperity and a local economy, not on overseas commerce. In the mid-eleventh century a system to channel water to the city from the Besos River was developed (the *rec comtal*), and mills were constructed along this waterway. Villages on the city’s periphery engaged in intensive agricultural production that contributed to the development of local and regional trade. By the late eleventh century, according to Banks, the population of Barcelona was three or four thousand, compared with about one thousand in 900. The city remained centered on the area enclosed by the Roman walls but had expanded eastward toward the *rec comtal*. Within the city a Jewish quarter (the *Call*) emerged south and east of the cathedral before 1100.

The status of Barcelona as a Mediterranean port was achieved. After the growth of its regional agricultural and political power, Barcelona in the twelfth century became a major port as it began to trade exten-

sively with Italy. Banks estimates the population in 1200 at ten to twelve thousand. In the twelfth and thirteenth centuries the city expanded in every direction beyond the Roman walls and absorbed the port quarters and many of the once-rural villages on its former outskirts. Unlike Italy, where powerful families would dominate particular urban quarters, Barcelona’s neighborhoods did not coalesce around particular magnate patrons. Prosperous and influential families were less prone to internecine violence than in Italy, and the count continued to dominate the city with little challenge to his rule.

Barcelona turned a considerable amount of aggressive energy outward, in Mediterranean expansion, beginning in the thirteenth century. These expeditions united military and commercial purposes and were supported by nobles and townsmen. Some conquests, such as that of Mallorca in 1229, proved permanent, while others, such as the Sardinia campaign (1323–1324), were ultimately unsuccessful. Barcelona attempted by these expeditions to offset the strength of its rivals (especially Genoa and Pisa), to impose its economic power on Muslim North Africa, to guarantee grain supplies, and of course to support the ambitions of the king. The Sicilian Vespers uprising against Angevin rule in 1282 led to the intervention of the king of Aragón and Catalan-Aragónese control of this strategic and grain-exporting territory. In part as a return on the financial investment of Barcelona’s citizens in the Sicilian enterprise, the king granted what would become the fundamental charter of self-government to Barcelona, a document known as *Recognoverunt proceres* (1284). This assured property rights within the city and granted a degree of municipal autonomy. By this time Barcelona held an effective monopoly on Catalan long-distance trade, regulated the activities of foreign merchants, and had opened consular offices in other Mediterranean ports. The government of Barcelona was vested in a council of one hundred members (the *Consell de Cent*), established in 1265.

There is considerable debate about the nature and causes of the late medieval economic crisis in Barcelona. Certainly difficulties (famine in particular) were visible before the onslaught of the Black Death in 1348. As elsewhere, that epidemic had dramatic results, but how much of the subsequent decline of Barcelona can be directly attributed to it is in doubt. The population, which had been at 50,000 before 1348, sank to 38,000 by 1378 and would decline further in the fifteenth century. Yet the late fourteenth century also saw the construction of the shipyards (*drassanes*), the Hospital of Santa Creu, the exchange (*llogia*), and extensive building programs in parish churches. Barcelona’s problems in the late fourteenth and fifteenth cen-

turies were related to the overall European depression, but the city also fell behind its Italian competitors who also had to contend with the structural problems of the late Middle Ages. The difficulties of Barcelona are related not only to the superior economic power of Italy but to the internal crises of Catalonia, political factionalism, the unpopularity of the Trastámara rulers, and especially the low productivity of agriculture and the peasant discontent that culminated in war during the late fifteenth century.

Within the city the aftermath of the plague produced a sharpening of tension between artisans and patricians and an increased anti-Jewish sentiment. The riots of 1391 all but ended the Jewish presence in Barcelona. Economic decline became acute after 1425. Valencia prospered at Barcelona's expense while the king held his court in Naples as Barcelona vainly cajoled or demanded his return. Urban factions, the Biga and Busca fought each other in midcentury, the former identified with the higher patriciate, the latter with the middling groups. Their conflict formed part of the confusing civil war of 1462 to 1472, which appears to have completed the devastation of Barcelona's medieval economy.

BARCELONA, COUNTS OF See BARCELONA, COUNTY OF

BARCELONA, COUNTY OF

The regions of the eastern Pyrenees later to be known as Catalonia were part of a vast territory organized by Charlemagne and his successors as a buffer against the Muslims in Spain. Toward the year 900 a number of counties were established, and in the tenth century the one centered at Barcelona assumed the precedence that followed naturally from its strategic location. But the early counts of Barcelona were the brothers and cousins

of other counts descended from Guifré the Hairy (870–897), an energetic defender and colonizer, and it is a remarkable feature that the condominium solidarity he initiated persisted for many generations thereafter. Nevertheless, Borrell II, count of Barcelona and Urgell (947–992), was already the foremost count when renewed Muslim attacks in 985 and after forced a new destiny on Barcelona. Appealing unsuccessfully for aid from the king of France, Count Borrell and his successors not only drove off the Muslims but effectively reversed their aggressions in raiding expeditions that greatly enriched the prospering population of Barcelona and its hinterlands. Like the counties of Urgell, Cerdanya, and others, Barcelona remained nominally dependent on the king of France, although in later tradition the unaided defense of Barcelona was represented as marking a legal devolution of sovereignty to the counts of Barcelona.

The eleventh century was a great age of growth. Agrarian settlements expanded and multiplied, drawing on migration from the mountains; quickened commercial links with Spain and Occitania brought exchanges of slaves, weapons, horses and cloth; Muslim gold coins circulated and were minted in Barcelona by 1018. Clerical culture flourished in the old dynastic homeland, where Oliba (971–1046) was abbot of Ripoll and Cuixà from 1008 and bishop of Vic (1018–1046); he promoted monastic reform in touch with trans-Pyrenean influences, as well as liturgical and classical studies.

Traditional legal and institutional structures persisted. The law remained Visigothic, public and territorial; the administration, Carolingian. The count dominated his lands with the support of viscounts and vicars in well-spaced castles, drawing on the military and economic services of a mostly free population. But this social and institutional cohesion collapsed in the years after 1020. Count Berenguer Ramón I (1017–1035) was unable to maintain his predecessors' momentum against the Muslims, thereby depriving a fiercely ambitious military class of its cherished outlet. The castles of aggressive lineages, manned by mounted warriors ever more numerous and less disciplined, multiplied beyond the count's control. Castellans fought among themselves, ravaged peasant lands and requisitioned crops, and imposed upon helpless tenants an array of obligations that soon hardened into a custom of banal lordship. The old procedures of public courts gave way to private settlements. The principle of public order persisted in the Truce of God (1027 and after), proclaimed by bishops who imposed specific protections for clergymen and unarmed persons. The resulting statutes would later be appropriated by the count, but meanwhile the assault on his prerogatives continued.

It was Count Ramón Berenguer I (1035–1076) who finally prevailed and established a new political order. Regaining control of the principal castles, he progressively secured the alliance or fidelity of other counts and viscounts, as well as that of other lords of castles. He insisted on the sworn allegiance even of subordinate castellans and knights, together with the right of entry to castles. But little of the old order survived. Ties of personal fidelity proliferated throughout society, replacing the weakened sanctions of the law. Castellans and their enfeoffed knights formed a new aristocracy based on their exploitative lordship over peasants. The new regime was thus a feudal order dominated by the count of Barcelona, who now sought to expand his direct lordship even at the expense of his cousins in Besalú, Cerdanya, and other counties.

About 1060 dawned the great age of the county of Barcelona. Ramón Berenguer I and the Countess Almodis acted as independent “princes” to secure territorial order, reimposing the Peace and Truce (1064) and bringing the Visigothic law up to date. They and their successors cut great figures in the wider Mediterranean world. Ramón Berenguer II (r. 1076–1082) married a daughter of the Norman prince Robert Guiscard, and their son married first the Cid’s daughter and later the heiress of Provence. Practices of the Gregorian reform were introduced in legatine councils (1077, 1078), while initiatives of Ramón Berenguer III (r. 1082–1131) in Muslim lands led Pope Urban II to proclaim the restoration of the archbishopric of Tarragona.

Arguably the greatest of the independent counts were Ramón Berenguer III and Ramón Berenguer IV (r. 1131–1162). They faced serious challenges from resurgent Muslim attacks, consolidated their power in the old counties, and set about instituting government. Ramón Berenguer III succeeded to the county of Besalú in 1111, a devolution carefully prepared, and to that of Cerdanya in 1118. Characteristically, the old counties were swallowed up in an expanded county of Barcelona, as were other counties thereafter: Roussillon (1172), Pallars Jussà (1192), Urgell (1314), and Empúries (1322). Interests in Occitania and Provence were cultivated at the price of enduring conflict with the counts of Toulouse, but the county of Barcelona as such was never conceived to extend north of the Pyrenees. Ramón Berenguer III was entitled count of Provence (in right of his wife) from 1113; Provence was a tremendous dynastic prize that his descendants would labor to secure and govern. He momentarily seized Mallorca (1114–1115) and began the effective restoration of the church of Tarragona.

His son Ramón Berenguer IV brought all these enterprises to triumphant fulfillment. Marrying the heiress to Aragón, he was count and prince from the

year 1150. He led the ever restive barons on lucrative raiding expeditions as far as Almería before driving the Muslims out of Tortosa, Lérida, and Fraga (1148–1149). He renewed the effort to legislate for the expanded county, he tried to establish a territorial tribunal, and he encouraged the institution of a novel system of fiscal accountancy for his domains. He negotiated with Henry II and Alfonso VII as if he were their equal. He encouraged new religious foundations, such as the Cistercians at Poblet and Santes Creus (1150–1153), and was celebrated by monks at Ripoll as a dynastic restorer and conqueror.

What he did not do was assume the title of king, either in Aragón or in Catalonia. His son (Alfons II, 1152–1196) would be Alfonso II in Aragón, the first of a dynastic series of kings; but they remained counts of Barcelona. So in a sense the county’s history continues for centuries after 1162, but by the later twelfth century people were referring to the expanded county as Catalonia, whose history may be read elsewhere.

BARRIENTOS, LOPE DE

Barrientos was a Dominican friar from a noble family born at Medina del Campo in 1382; he died at Cuenca, 30 May 1469. He was educated at the University of Salamanca and entered the OP at the convent of San Andrés at Medina. By 1415 he held a chair in theology at Salamanca. In 1434 he was named preceptor to Prince Enrique by Juan II of Castile. While at court, he intervened on the king’s behalf in helping sort out the many intrigues aimed at weakening the monarchy and against the policies of the king’s favorite, Don Álvaro de Luna.

When the intellectual and polymath Enrique de Villena died in 1434, it was Barrientos who carried out the king’s order to burn Villena’s library because Villena had fallen under suspicion of sorcery. In 1438 Barrientos became bishop of Segovia, a position that he exchanged with Juan de Cervantes for the diocese of Ávila in 1441 in his efforts to bring an end to the hostilities between Juan II and Prince Enrique in order to unite the kingdom against the designs of the Infantes de Aragón. By 1445 Barrientos was instrumental in the defeat of the nobility and the Infantes de Aragón at the battle of Olmedo. That same year he became

bishop of Cuenca, whose defenses he organized in 1449 to repel repeated attacks by the partisans of the Aragónese and Navarrese interests in the realm. When don Álvaro de Luna was executed at Valladolid in 1453, Barrientos became Juan II's chief political adviser. After the king's death in 1454, he was named *canciller mayor del reino* by Enrique IV. Barrientos is buried in the Hospital de Piedad at Medina del Campo.

BASQUE LANGUAGE

Basque, or Euskara, the only non-Indo-European language of western Europe, is presently spoken by approximately 800,000 people in a community of less than three million inhabitants. It is probably the oldest European language. The Basque country (170 km east to west and 60 km north to south) extends on both sides of the French-Spanish border, in the western Pyrenees, by the Bay of Biscay.

The invasions of Indo-European peoples erased most of the indigenous languages. Basque survived due to its isolation. Later on, the Romans imposed Latin as the only official language in their empire, causing the disappearance of Indo-European and Iberian languages. Basque continued to survive even after the disappearance of Latin, while Romance languages developed and took root.

The Basque language is not part of any linguistic family, yet it is not a completely isolated language, as has often been said. Basque adopted the Latin alphabet, maintaining its five vowels (*a, e, i, o, and u*). There are twenty-two single letters plus seven compound letters (*dd, ll, rr, ts, tt, tx, and tz*). Basque, while keeping its structure, adapted a number of words from Latin during the presence of the latter over five hundred years in the area. The first two sentences written in Basque date back to the tenth century. They appear in the manuscript "Glosas Emilianenses" (monastery of San Millán de la Cogolla, Rioja, Spain), written in Romance language.

An outstanding feature of the Basque language is its ergative form. Its morphology could be defined as being of an "agglutinating" kind, because verb forms include subject, direct and indirect objects, and plurals through prefixes, suffixes, and infixes. From the point of view of the syntax, the construction of the relative pronoun is one of the most original parts of its gram-

mar. The relative particle is *-n* (after a vowel, or *-en*, after a consonant), and it always appears as a suffix to the auxiliary verb followed by the noun to which it refers.

Word order is also very different from English and the Romance languages. In Basque there is usually a focus or "element inquiry" that must immediately precede the verb.

The Basque language is divided into several dialects. L. L. Bonaparte (1813–1891) was the first writer to have elaborated a map of Basque dialects. According to him, from west to east and from south to north we encounter Biscayan, Guipuzcoan, High Navarrese (northern and southern), Labourdin, Low Navarrese (western and eastern), and Souletin or Zuberoan. In historical times the area in which the language is spoken has been slowly receding, particularly in the eastern and southern areas. Through the existence of toponimic names we know that Basque was spoken in the province of La Rioja and even in the north of the province of Burgos. However, during the last twenty years the number of Basque speakers has been steadily increasing, numbering over one hundred thousand new ones between 1982 and 1992.

Many scholars have tried to prove that Basque is related to other languages, such as Iberian or Georgian. However, these attempts have shed little light on the question of the origin of the Basque language and it is very likely that this question will remain unanswered.

BASQUE PROVINCES

Euskal Herria, or the Basque country, is composed of seven provinces situated in the western Pyrenees between Spain and France. Four of these provinces (Vizcaya, Guipúzcoa, Álava, and Navarra) lie in Spain and three (Labourd, Baja Navarra, and Zuberoa) in France. Euskadi covers 20,650 square kilometers and is inhabited by almost three million people.

This region dates back to antiquity, according to remains older than the Middle Paleolithic period. Some of these remains show the presence of Cro-Magnon man in Euskal Herria. The Basques are distinctly different from the peoples of the Mediterranean and Alpine regions.

In this small area, surprising for the diversity of its landscape, there exists and is preserved today an

ethnic group that speaks a very particular language and has produced a culture with a customary judicial system. The Basque language has received various titles. From the language itself comes the name *Euskara*, and from a romanian perspective, the name Vascuence is derived. A geographically isolated language, it is clearly different from all surrounding Indo-European languages. This language has been the most effective transmitter of Basque culture and is today the fundamental element for its continued survival, as the language has been the most important element in the configuration of the Basque country. Euskara, defines the Basque as *Euskaldun*, or "possessor of Euskara."

The Basque language has conserved its ancient structures, original morphology, and syntax. The structure of the verb distinguishes it from Latin and the Romance languages. Euskara's verb forms are quite complex but at the same time very logical, and they have attracted the attention of many foreign linguists.

Today, Euskara is divided into six dialects, that demonstrate the necessity of a *kione* or common united language, especially for the media (press, radio, and television), written literature, and the Basque University. The first attempts to unify Euskara started at the end of the nineteenth century but were not finished until 1968, when the linguistic normalization of Euskara began. The number of speakers of Euskara is, today, some 800,000, unequally distributed throughout the Basque territory. In general, the highest densities of Basque speakers lie in the province of Guipúzcoa, the eastern part of Vizcaya, and the north of Navarra, with a higher incidence in rural rather than urban zones.

The Basque ethnic group also possesses distinct physical characteristics. Cranial morphology and hemotypology show unique characteristics among the Basques. For example, the incidence of blood type O is quite high, type A is in relatively low proportion, and type B is almost nonexistent. The frequency of the Rh-factor is higher in Basques than in other peoples.

Concerning the judicial system, Basque law is customary, popular, and natural, emanating from the social group that created its proper order of laws in conjunction with its necessities. Conceived by an agropastoral population, Basque law is essentially customary. The Basque houses, called *baserriak*, were the basic cells of the Basque social organization. Each one of these housed one family, uniting the house to the extent that each family took the name of its house. The judicial system was created to perpetuate this unity, and the Basques were able to conserve their identity through the centuries, even after their integration into the Spanish and French centralist monarchies.

Since the Middle Ages, the Basques preferred to group themselves in *hermandades* (brotherhoods) and

thus secured their own protective armada. In this way, the majority of them avoided the feudal system, and if they had to suffer the guardianship of a monarch or powerful lord, they were always careful to pact with them. The Basques accepted feudal sovereignty, but under the condition that the king or feudal lords swore to respect the ancient *fueros* (codes of law) and old liberties. In this way, the king or feudal lord was not more than a military chief and supreme justice in criminal matters, and the people preserved their freedom and sovereignty. Even the powerful Catholic kings of Spain swore to respect the old Basque traditions under the sacred Tree of Gernika in Vizcaya. The king of Castile was recognized only as lord of Vizcaya and not as a Basque king. If this lord did not respect the old *fueros*, the Basques applied the saying, "Obey, but do not fulfill." Thus, they were able to maintain their institutions despite of the invasion of foreign concepts derived from Roman Law.

Each of the Basque territories, united with the crown, possessed a series of rights (exemption from military service and taxes, etc.) that the central powers—France as much as Spain—persisted in abolishing. In this way, the French Revolution (1789) attained the administrative assimilation of the three northern provinces, just as in the south, the First Carlist War (1833–1839) caused the destruction of the old liberties and the Second Carlist War (1872–1876) established their definite loss.

At the end of the nineteenth century and as a reaction against the loss of the aforementioned *fueros*, the new nationalism created by Sabino de Arana y Goiri (1865–1903) presented the problem of the independence of the Basque country, which culminated in the Spanish Civil War (1936–1939). The war abolished the autonomy of the Basque government, which sought refuge in exile after the bombing of Guernica and the fall of Bilbao under the troops of Franco, Hitler, and Mussolini. Exile did not diminish Basque nationalism, which was reborn more determined than ever. In modern times it represents two-thirds of the Basque electorate of the autonomous community of Euskadi (Guipúzcoa, Vizcaya, and Álava). Although the motto *Zazpiak Bat* (seven united Basque provinces) has resounded since the end of the nineteenth century, the Basque country continues to be politically divided into three parts: Euskadi; Navarra; and the French Basque country, with its three provinces.

The political unity and independent state so desired by many Basques is still very far away, but there does exist a certain cultural unity. On both sides of the border, many Basques conserve the very clear consciousness of belonging to a common ethnic group with the same cultural task. Euskal Herria is still far

from attaining a real autonomy that includes political sovereignty, but the situation—cultural as much as political—is gradually improving. For the first time, Euskal Herria has a Basque University with 47,000 students, some Basque forms of communication (press, radio, and television), an official language that gives rise to a promising literature, and an ample network of *ikastolak*, or Basque schools for children.

BATHS

Public bathhouses in Iberia were known in Roman times, as a number of archeological remains attest. While not on the scale of those in the imperial city of Rome, the bathhouses in Hispania contained the customary pattern of chambers, including a dressing room, steam room, hot water room, tepidarium for gradual cooling, and finally a cold water pool. The medieval Muslim bath, or *hāmmam*, varied from the Roman model in that it had fewer chambers and concentrated more on perspiration as a method of cleansing. The bather disrobed, stored garments, and received bathing materials. He or she then proceeded in turn to an unheated room, a warm room, and finally a hot steam room. The patron then returned to the warm room, where epidermal waste was removed by rubbing, scraping, lathering, and washing. When the expanding Christian kingdoms pushed southward, it was almost certainly the Muslim type of bathhouse the northerners encountered. While there is some evidence of public bathing in the Christian north during the eleventh and twelfth centuries, the evidence is scattered. More indicative, the great families of municipal charters (*fueros*), begun in the later twelfth and thirteenth centuries, demonstrated a concern for the operation of the bathhouses in the conquered Muslim towns, a concern that strongly suggests unfamiliarity.

In all probability, the initial amelioration of Christian apprehension with this established aspect of Muslim social life was begun in the wake of the conquest of Toledo in 1085. Little survives in the way of written evidence to reveal this process to us, but the *baños* (baths) law of the municipal charters and codes probably reflects a century or more of synthesis and absorption. Some have postulated bathhouses as an important source of *convivencia* (conviviality) given indications

Caldarium of the baths. Built by Yūsuf I (1334–1354), Naṣṣ-rid dynasty. Copyright © Scala/Art Resource, NY. Alhambra, Granada, Spain.

that men and women of Islamic, Jewish, and Christian faiths utilized this very personal facility. While Muslim and Jewish bathhouses continued to operate independently of Christian regulations and usage in larger cities such as Sevilla and Valencia, in the smaller towns like Cuenca, it was not likely that more than one public baño existed. Close reading of the charters and codes for such towns indicates some variety of practice with regard to religious segregation in these facilities. In the towns of Leonese Extremadura, Jews and Muslims were restricted from the bathhouses used by Christians. The Cuenca-influenced charters allowed Jewish use only two days a week, when Christians were not to bathe in them. Aragónese charters permitted Jewish and Muslim use but on one day of the week only. The longer codes of Tortosa and Valencia contain some ambiguity on the question, but seem to have been more liberal regarding use by individuals of mixed religious background. The *fueros* reveal great apprehension concerning *baño* use by women, segregating them strictly from men to avoid any question of their loss

of honor. Punishments for mixing religions or sexes in these bathhouses were often severe.

The later fourteenth and fifteenth centuries witnessed a decline in the usage of baños, likely the result both of growing religious tensions in Iberia and of concern for the spread of disease in the wake of the Black Death. Arguably, their history suggests as much societal segregation as it does convivencia.

BAZA, SIEGE OF

In the final period of the Nazarí (Naşrid) kingdom, Baza was besieged by King Fernando the Catholic in the spring of 1489, and the town capitulated on 4 December 1489.

In connection with this historical event, the *romance* (ballad) "Sobre Baça estava el Rey . . ." was written. It was harmonized by the musicians of the Royal Chapel, and both text and musical notations have been preserved in the *Cancionero musical de Palacio* (ed. J. Romeu Figueras, Barcelona, 1965). The extant version is brief (26 octosyllabic verses); it may have been abridged for musical performance. The romance is in this version a characteristic sample of the primitive style of frontier ballads due to its use of rhetorical devices such as the anaphora, the enumeration, and the formula. The ballad does not relate the siege. Rather, it tells about the king looking at his own camp, the nearby orchards, and the walls surrounding the town. A Moor begs him to lift the siege, and thus the poem ends with an abrupt closure. The tense situation is handled in a way that relates to the point of view of the Moors, and it hardly corresponds to the actual development of events, since victory was achieved by the Christians. This ballad did not survive in oral tradition, except for a possible contamination detected in a few verses of the romance "El Mostadî" (see Armistead). Baza will be mentioned in some of the "new" or artistic Moorish ballads (almost always in ballads with an A–A rhyme scheme). There are two late ballads on the siege of Baza. "¡Arriba, gritaban todos . . ." (*Romancero General*, Madrid, 1947) is mainly fictional. Gabriel Lobo Lasso de la Vega is the author of "Confuso está y atajado . . ." (*Romancero y tragedias*, Alcalá de Henares, 1587), which has no connection with the frontier ballad mentioned above.

BÉARN-ARAGÓN

It is well known that the kings of Aragón had dreamed of founding a vast state straddling the Pyrenees. However, historians often forget that such a state comprised, for almost two centuries, an area situated on the Atlantic side of the northern Pyrenees—the viscounty of Béarn. It was ruled from the middle of the twelfth century to the end of the thirteenth by a Catalan family from the north of Barcelona, the Moncade. That the viscounty of Béarn, born in the ninth and tenth centuries within the framework of the duchy of Gascony, left its influence to enter the orbit of the Aragón is due mainly to the Reconquest, the recapture of the valley of the Ebro River from the Moors by the Christians. Indeed, until the end of the eleventh century Huesca, only fifty miles from Béarn, was a Muslim city. Only the small primitive kingdom of Aragón around Jaca stood between Béarn and the Moors. As a result, the viscounts of Béarn often found themselves fighting south of the Pyrenees on the Aragón side. They fought in all the important battles in the valley of the Ebro from the capture of Huesca (1096) to that of Palma de Mallorca (1229). One of the greatest victories was the capture of Zaragoza in 1118, thanks to the combined efforts of Alfonso I (el Batallador) of Aragón and the viscount of Béarn, Gaston IV the Crusader. However, after the Reconquest had been successfully concluded and Aragón had been united with Catalonia, the relationship between Béarn and Aragón changed: what had been an alliance of equals turned into a master-vassal relationship. Béarn had fallen to a woman who was forced to marry a Moncade; thereafter, the viscounts of Béarn had to pay homage to the kings of Aragón, and they remained their vassals even after the Aragónese had been defeated at Muret (1214). This political situation had long-lasting legal consequences. While under the control of Aragón, Béarn was granted a variety of complex charters of customs—directly modeled on the Spanish *fueros* (codes of law), and particularly those of Aragón—that were called the Fors of Béarn. At the end of the thirteenth century Béarn returned to the Gascony, which had itself passed under the control of the kings of England. Though Béarn had turned its back on Aragón, the two retained a close relationship in the fourteenth and fifteenth cen-

turies. First, the viscounts of Béarn had also become counts of Foix (1290) and, as such, owned lands for which they owed allegiance to Catalonia; second, Béarnese merchants continued to trade on both sides of the Pyrenees.

BÉARN-NAVARRÉ

Lying on either side of the Pyrénées, the principality of Béarn and the kingdom of Navarre shared a common border along the valleys of Baretous and Roncal. Thanks to their close links, over the course of time they developed a kind of good-neighbor diplomacy: the sanction in case of infringement of the treaties consisted of the guilty party paying a fine. This ritual is still enacted every year at the Pass of Pierre Saint-Martin. From the eleventh century, when they crossed into Navarre along the pilgrimage routes to Santiago, Béarnese merchants traded actively in Navarre; their activity reached its height in the fourteenth and fifteenth centuries. Thanks to their neutrality during the Hundred Years' War, they traded between Bayonne (where English goods were unloaded) and Pamplona and Tudela in Navarre. These routes also brought with them artistic influences, particularly after close relations had developed between the court of Béarn, at Orthez, and the court of Navarre. From the fourteenth century, when the viscounty of Béarn had become a sovereign principality, the links with Navarre grew closer. Gaston III Fébus (1343–1391) had married Agnes, the sister of Charles II of Navarre. After cooperating for a number of years, however, the two brothers-in-law came into conflict with each other; Gaston repudiated Agnes and then tragically killed his own son at the court of Orthez.

The policy of union between Béarn and Navarre was resumed in the fifteenth century when economic relations between the two countries were strengthened by the founding of trading companies controlled by merchants from Béarn who had settled south of the Pyrenees and were supplying the court at Pamplona. The first marriage to take place between the two dynasties at the beginning of the fifteenth century failed to reach the desired conclusion: Jean of Foix Béarn and the infanta of Navarre died childless. In the end, Béarn fulfilled its ambition as the result of an incredibly complex crisis of succession that caused a civil war. The Viscount of Béarn, Gaston IV (1436–1470), married

Eleonora, the daughter of Juan II, king of Aragón and Navarre. In a treaty signed at Barcelona, Juan II granted the right of succession of Navarre to Eleonora, to the detriment of her elder brother Don Carlos. As a result, part of Navarre rose up and Gaston IV died at Roncesvalles on his way to help his wife contain the rebellion. Nevertheless, the heirs of Eleonora and Gaston of Béarn retained the crown of Navarre. Thus, at the time when Castille and Aragón had united to form a single kingdom, another state, Béarn-Navarre, was being formed on both sides of the Pyrenees with control of the passes of Roncesvalles and Somport. However, Castilian pressure at the beginning of the sixteenth century put an end to the union of Béarn and Navarre. Thereafter, the western Pyrenees became a mere frontier between France and Spain.

BEATRIZ OF SWABIA See ALFONSO X, EL SABIO, KING OF CASTILE; FERNANDO III, KING OF CASTILE AND LEÓN

BEATRIZ

Wife of Afonso III (1210–1279), King of Portugal (r. 1248–1279). Beatriz was the illegitimate daughter of Alfonso X of Castile and León "the Wise," and María Guillén de Guzmán. The conditions of Beatriz's marriage were closely linked to the integration of the southern region of Algarve, into what was going to become part of the territory of Portugal. Afonso was a second son and, at the age of eighteenth, he left with his sister Leonor for Denmark, where she became the wife of Waldemar III. When the king died (1233), he moved to the French court of Louis VIII. Around 1238 he married Mathilde or Mahaut, Countess of Boulogne. Meanwhile, his brother Sancho II was deposed by the Church and Afonso was selected to be his successor. Sancho II had to interrupt his campaign against the Moors in the Algarve, and one of the main tasks of Afonso was to pursue the Reconquest. But Alfonso X, moved by a hegemonic ambition, wanted to expand his borders, and previous agreements with Sancho II were soon to be broken. Yet, as Alfonso X began to feel hard pressed on the borders of Aragón and Valencia, he sought a conciliation with Afonso III; Alfonso X arranged his marriage to Beatriz. Although she was too young and Afonso was still married, the contract

was signed and sealed in 1253. It stipulated that before a son born out of that union reached the age of seven Alfonso X would be the beneficiary of those territories. This complex situation of bigamy raised serious problems, as Countess Mathilde complained to Pope Alexander IV, whose unsuccessful efforts to dissolve the marriage led him to excommunicate Afonso III. Mathilde's death in 1258 broke the impasse. Beatriz gave birth to twelve children, including Dinis, heir to the Portuguese throne.

BEATUS OF LIÉBANA

Participant in the adoptionist controversy, commentator on the Apocalypse; very little is known about his life beyond his participation in the former. He appears to have been a priest or a monk in Liébana (Cantabria). In 785 he coauthored (with Eterius, who would later become bishop of Osma) a letter to Elipandus, the metropolitan of Toledo, that denounced the latter's belief that Christ had adopted his human nature at the time of the Incarnation. This letter was prompted by one written a short time before by Elipandus to an abbot Fidelis, asking him to reprimand Beatus and Eterius for an earlier challenge to his views on the Incarnation. At stake, at least from Elipandus' perspective, was not only doctrinal accuracy but the continued authority of the metropolitan see of Toledo over the greater Spanish church. Beatus was also attacked in two subsequent letters from the bishops of Spain to the bishops of Gaul and to Charlemagne, respectively, expressing their support for the adoptionist position. Charlemagne responded by convening the Council of Frankfurt in 794, at which the assembled bishops condemned adoptionism as heresy.

Beatus is better known today as the author of a commentary on the Apocalypse, though the evidence supporting this attribution is circumstantial. The first version of the commentary was finished in 776, with subsequent editions in 784 and 786. The commentary is little more than a compilation of the opinions of previous authorities on the subject, though the names of the sources from which the author drew reveal something of the range of materials available to a scholar in the early period of the Asturian monarchy. The conservatism of the author is interesting in light

Beatus de Liébana (8th c.). Daniel in the lion's den, to whom Habakuk, lifted by an angel, is bringing food. Below, King Darius lying wakeful on his bed, is guarded by two soldiers. From Commentary on the Apocalypse, ca. 1220. Copyright © The Pierpont Morgan Library/Art Resource, NY. The Pierpont Morgan Library, New York, N.Y., U.S.A.

of the fact that he was writing more than fifty years after the Muslim invasion and thus was in a position to cast the invaders in an apocalyptic role, if he had been so inclined. The primary significance of the commentary lies not in the text but in the illuminations that accompany it in the many manuscripts of the work that have survived from the tenth through the twelfth centuries. These so-called "Beatos" contain some of the most impressive examples of the so-called Mozarabic artistic style.

BEHETRÍAS

In the fluid rural world of medieval northern Castile, the peculiar conditions of the Reconquest and of the early settlement of the land led to the emergence of distinctive forms of dependence and ties between peasant and lord. One of these bonds of reciprocity was the institution known as *behetría*. The *behetrías* have received a great deal of attention from Castilian institutional historians and have been the source of endless historiographical debates. In the simplest terms, the men and women of *behetrías* (*benefactoria*) had the right to choose their lords. They did this either from sea to sea (*de mar a mar*), that is, from any lord in the land—or, more often in the late Middle Ages, from a specific family, the so-called *behetrías de linaje* (of a specific lineage). According to Sánchez Albornoz, in theory the men and women of *behetrías* could change their lords as many as seven times in one day if the arrangements proved to be unsatisfactory. In reality, there is not yet any documentary evidence that these men and women could really exercise their theoretical right to change lords in the late Middle Ages.

The origins of these special agreements probably went back to the early centuries of the repopulation of the land, when the dispersion of agricultural settlements and the poverty of demographic resources in the northernmost part of Castile (the result of the occupation of the Duero River valley in the tenth and eleventh centuries) allowed these free peasants to enter into advantageous pacts of commendation (*encomendación*) with the lords in the region. These ties were hereditary, and by the mid-fourteenth century we find in the *Libro becerro de behetrías*—a census of royal, ecclesiastical and seignorial rights in most of the area north of the Duero River compiled in 1351—a large number of people of *behetrías* holding on, at least in theory, to the same privileges gained by their ancestors four centuries earlier. Free, yet owing certain seignorial dues to their lords, these men and women occupied a transitional stage between the free landholding peasants working royal lands and those free peasants who toiled in seignorial or monastic holdings under heavier fiscal and, at times, even semi-servile conditions. In fact, however, these distinctions often did not make a great deal of difference. As was the case in the lands held by the church, by noblemen, or by the crown, what the men and women of *behetrías* owed their lords changed from place to place and depended on local conditions. The late Middle Ages saw a progressive deterioration

in the rights of the people of *behetrías*, to the point where there was little difference between them and those peasants holding land from secular lords, the so-called *solariegos*.

Although the figures vary from study to study, the number of *behetrías* listed in the *Libro becerro* ranges from 418 to 628 villages out of the about 2,400 places listed in the census. A good number of other villages were under mixed lordships: seignorial, royal, ecclesiastical. Regardless of the exact number of *behetrías*, it is clear that this type of arrangement between lord and peasant was of considerable importance as a pattern for relations between lord and peasant and between peasants and the land.

BELCHITE, CONFRATERNITY OF

Belchite, like Zaragoza, was reconquered from the Muslims in 1118. It was strategically placed south of the new capital, and in 1122 Alfonso I of Aragón made it the headquarters of a military confraternity, dedicated to permanent war against the infidel. Its privileges were confirmed in 1136, but it disappeared soon afterward. The confraternity was remarkable in possessing features characteristic both of a Christian military order and of an Islamic frontier *ribāt* (monastic fortress). Those who came to Belchite to fight in the service of Christ for the rest of their lives were compared to men entering the life of a monk or a hermit. But just as much attention was given to those who served for a term; one year's service earned the same remission of sins granted to those who marched to Jerusalem. One month's service was the equivalent of fasting on Fridays for a whole year. Any time spent fighting at Belchite earned double the merit to be gained for the same period spent on a pilgrimage. Moreover, propaganda on Belchite's behalf was as meritorious as service there—a principle long applied to the *ribāt* but only taken up into crusading ideology after 1122.

Belchite's combination of the Christian concept of a lifelong monastic vocation with the Islamic notion of spiritually meritorious stints of service in a *ribāt*

constitutes firm evidence of Muslim influence on the emerging military orders. Consequently, the knights serving for a term in the temple were probably more important in the earliest days of that Order (1119–1128) than its subsequent rule suggests. Had Belchite survived to become a full-fledged religious house, it too would have had to confine its knights serving for a term to a marginal role, since a temporary vocation was alien to Christian monasticism. In the event, the complications created by Alfonso I's will greatly aided the confraternity's demise.

BELTRÁN DE LA CUEVA

Beltrán de la Cueva owed his rapid political and social advancement to the fact that he was one of the favorites of Enrique IV of Castile. Shortly after joining the court in 1455, he was appointed *camarero mayor*, and then subsequently became a lord of Jimena, Count of Ledesma, master of the military order of Santiago (a position he was forced to give up in 1464), and Duke of Alburquerque. His rapid promotion provoked enormous hostility, especially among other competitors for the royal favor such as the marquis of Villena, Juan Pacheco. Married to a daughter of the second marquis of Santillana, rumor nevertheless associated his name with several scabrous sexual relationships, all of which are alluded to in the satirical verses of the contemporary *Coplas del Provincial*. It was alleged, for example, that he was not only the king's homosexual lover, but also the lover of the queen, Juana of Portugal.

Such allegations were to acquire enormous political importance in the context of the disputed succession to the throne after Enrique IV's death in 1474. For if the Infanta Juana was not the king's daughter but the illegitimate fruit of an adulterous relationship between Beltrán de la Cueva and the queen, then the succession could rightfully be claimed by Isabel the Catholic. The Infanta Juana, thus nicknamed "la Beltraneja," ended her days in exile in a convent in Portugal, and her putative father loyally served the Catholic Monarchs until his death in 1492.

BENEDICT XIII, ANTIPOPE

Pedro Martínez de Luna, a close relative of the Aragónese royal family, was elected Pope Benedict XIII in 1394 on the death of the Avignon antipope Clement VII in an attempt to settle the Great Schism that had divided the western Church since 1378. Instead of resolution, however, Benedict's papacy prolonged the schism and intensified the political polarization of western Europe.

Born in Illueca (Zaragoza) in 1328 or 1329, Martínez de Luna studied, obtained his doctorate, and taught canon law at Montpellier. He returned to Spain to serve as canon of Cuenca, archdeacon of the cathedral in Zaragoza, and provost of the cathedral in Valencia before joining the papal curia in Avignon in 1375; he was made cardinal deacon of Santa Maria in Cosmedin by Pope Gregory XI (papacy 1370–1378). Martínez de Luna voted for Urban VI (papacy 1378–1389) in the tumultuous papal elections of 1378, but later he concluded that the violent turmoil of the Romans prejudiced the election and rendered it invalid, and he threw his support instead to the French antipope Clement VII (papacy 1378–1394). The presence of the two popes—one in Rome and one in Avignon—divided the Church and initiated the Great Schism (1378–1422).

In 1378 Martínez de Luna was sent to Spain as papal legate, and secured for Clement VII political support from the Aragónese and Navarrese kings. His success in Spain prompted Clement to send Martínez de Luna as legate to Scotland, Ireland, England, France, and the Low Countries. It was in this capacity, while at a meeting at the University of Paris in search of solutions to the schism, that Martínez de Luna first advocated the *via cessionis*, whereby both rival popes would renounce the papal office so that a new pope could be elected.

When Clement VII died in 1394, Martínez de Luna was seen as the logical successor, someone who could be trusted to step down peacefully when the time came. He was anointed as Pope Benedict XIII despite the continued existence of the Roman Pope Boniface IX (papacy 1389–1404). Immediately after his election, however, Benedict XIII denounced the oath he had taken to abdicate and proposed a new solution to the schism, the *via declarationis iusticiae*, or negotiated settlement. Fervent in his belief in his legitimacy as pope, obstinate in his refusal to compromise, and skillful in his ability to outmaneuver opponents, Benedict managed to prolong the frustrating stalemate for

twenty-three years and to tarnish even further the reputation of the church.

Ecclesiastical affairs were thrown into disarray as each pope created new bishops and cardinals; European rulers took sides in the controversy prompting each pope to declare invalid all sacraments performed in rival kingdoms. England, the Roman Empire, and most of the Roman curia supported Boniface; France, Aragón, and Wales took Benedict's side. In 1398, the French, attempting to force a resolution in the matter, withdrew their obedience to Benedict, thus depriving him of substantial ecclesiastical revenues. Benedict's greatest support came from the Aragónese king Martin the Humane (r. 1396–1410) who literally saved Benedict from a French army that occupied Avignon in 1398. Benedict was nothing if not tenacious. He took refuge in Châteaurenard; by 1403, not only had he made peace with the French, but he had gained Castilian support as well.

Benedict made tentative moves toward a negotiated settlement in 1403, but Boniface IX died a year later and again the *via cessionis* was proposed as a means of settling the schism. The cardinals ignored Benedict's claims and elected Innocent VII (1404–1406) and later, Gregory XII (1406–1415), who pledged to work with Benedict to end the schism, but by then all attempts at negotiation were unsuccessful.

A general council was summoned at Pisa (1409), which both Benedict and Gregory refused to attend; they were condemned and deposed and a new pope, Alexander V (papacy 1409–1410), was elected. Benedict fled to Barcelona, where he maintained his legitimacy despite a second deposition in 1417 by the Council of Constance. He died in 1423 at Peñíscola, still styling himself as Pope Benedict XIII.

BENEDICTINE MONKS See MONASTICISM; RELIGIOUS ORDERS

BENJAMIN OF TUDELA

Benjamin of Tudela was a Jewish merchant renowned for his travels through various countries from about

1160 to about 1172, when he returned to Spain, dying shortly thereafter. He left a book in Hebrew (or more correctly his notes, which were turned into a book by an anonymous hand) concerning his travels, which became famous and in translation was one of the most widely read travel accounts of all time.

Muslim and Jewish travelers in the Mediterranean, and particularly from Spain, were numerous, and we have accounts of such voyages from many (among Jews, the most famous, besides Benjamin, were Ibrahīm ibn Ya'qūb of the tenth century and Judah al-Harīzī of the thirteenth). Benjamin's account is particularly valuable because of its details on commerce, agriculture, manufacture, and so on, and for the information it gives concerning remote and exotic areas of the world (including China). True, he did not personally reach these lands, but at least some of the information he received from secondhand reports is of value. His own personal travels were limited to the coast of Provence; Italy; the Greek isles; Constantinople and Asia Minor; Syria and Mesopotamia (nearly to India); Palestine, and Egypt.

His primary goals were to investigate and report on commerce and agriculture and to report on the presence and condition of Jews in various parts of the world, as well as to visit "holy sites." His estimates of Jewish populations in various regions and towns are generally substantiated by other sources, and his work is an important source for Jewish history. For general history there is also much of great value, including his listing of some thirty Christian nations which had merchants in Alexandria, and certainly his information on agriculture and technology.

The first Hebrew edition appeared in 1543, based on a faulty manuscript, and was copied in subsequent editions and Latin and early English translations, in spite of the more accurate edition of 1556, which subsequently appeared. The edition, with English translation, of Asher is based on a much better manuscript reading. Most important are the extensive notes (English) in the second volume. Adler's edition, finally, is based on the most accurate extant manuscript. The Spanish Hebraist Benito Arias Montano made the first translation, in Latin (1575), from which Purchas's *Pilgrims* English translation and others in French were made. A second Latin translation by Constantin l'Empereur appeared in 1633. Among more modern translations, that in Spanish by the Hebraist Igancio González Llubera, *Viajes de Benjamín de Tudela* (Madrid, 1918), is of importance for its erudite notes and critical apparatus. The modern Spanish translation by Magdalena is generally excellent, but unfortunately he did not utilize the notes in Asher and thus there are several errors.

BERBERS

An aboriginal people of northern Africa, they inhabit the area between the Sahara Desert and the Mediterranean Sea, from Egypt to the Atlantic coast and a substantial part of the population of present-day Libya, Algeria, and Morocco. The nomadic Tuareg distinguish themselves from other Berbers who live in villages and are loosely organized into tribes. Their native languages are classified as Hamitic, though many speak Arabic, the language of their religion, Sunni Islam. The Berbers were some of the earliest peoples to be Islamicized. Until their conquest by Muslim Arabs, many of them were Christians. Throughout their history, despite their shared religion, the Berbers have clashed with Arabs and risen up against them. At the beginning of the eighth century, they formed the rank and file of the Arab armies that conquered the Iberian Peninsula, which were generally directed by Arabs of Syrian or Arabian origin who fashioned themselves as elite and apart.

From the very beginning of the conquest of al-Andalus, the Berbers expressed their discontent, feeling that their just share of power and the spoils had been withheld from them. As a result, they often rebelled against the government, with whom they were frequently at odds. From the end of the ninth century on many were brought over to Iberia from North Africa by the caliphate to serve in its armies and to fill posts in the government. In this way, they later became a major presence in the civic life of al-Andalus in the eleventh century, influencing public affairs and the course of war and peace. In the years following the death of Al-Manṣūr, marked by political confusion and strife, the Berbers of al-Andalus succeeded in having one of their own briefly become caliph. At that point, they controlled all the territory from the northern frontier with the Christians to the Mediterranean in the south. During the reign of the tawā'if there were also small Berber kingdoms such as Albarracín in the lower Aragón ruled by the Razīn. Historically, however, the most important Berber clans proved to be the Dhū-l-Nūn of Toledo, later of Valencia, the Al-Aftas of Badajoz, and the Zīrids of Granada. The mother of the first Umayyad ruler of al-Andalus, 'Abd al-Raḥmān I, was a Berber.

BERCEO, GONZALO DE

The first Castilian poet to identify himself by name, Gonzalo de Berceo (1196?–1264?) is considered by many to be the master of *cuaderna vía*. He was educated at the Benedictine monastery in San Millán (he reminds us of this in *Vida de San Millán*, is listed as a deacon in a document dating from 1221, and registered as a secular priest in Berceo and notary to Abbot Juan Sánchez in later manuscripts. Dutton suggests that, given his profession and his literary background, he was probably trained at the Estudio General at Palencia between 1221 and 1228.

Dutton and Kurlat de Weber have established the following chronology for Berceo's works:

1. *Vida de San Millán*
2. *Vida de Santo Domingo de Silos*
3. *Sacrificio de la Misa*
4. *Duelo que fizo la Virgen*
5. *Himnos*
6. *Loores de Nuestra Señora*
7. *Signos del Juicio Final*
8. *Milagros de Nuestra Señora*
9. *Vida de Santa Oria*
10. *Martirio de San Lorenzo*

Additionally, two lost works (*Historia de Valvanera*, *Traslación de los Mártires de Arlanza*) have been attributed to him. Berceo's poetry may be divided into three categories: hagiography (*San Millán*, *Santo Do-*

mingo, *Santa Oria*, *San Lorenzo*), Marian works (*Loores*, *Duelo*, *Milagros*), and liturgical/doctrinal works (*Sacrificio*, *Himnos*, *Signos*)

Dutton argues convincingly that, in addition to the two purposes traditionally ascribed to Berceo's works (instruction and entertainment), the hagiographic materials were designed to propagate the legends of saints related to San Millán in order to bolster the prosperity of the monastery, which had declined due to the rise of new pilgrimage centers. This goal is clearly reflected in Berceo's first work, dedicated to the patron saint of his monastery. *San Millán* derives from various sources (the *Vita Beati Emiliani* of Braulio, the writings of the monk Fernandus including the forged *Votos de San Millán*) and it follows the tripartite structure of a saint's life (biography, miracles performed in life, posthumous miracles). Berceo introduces the propagandistic element at the outset, promising his public that it will be happy to pay the tribute due to the monastery after hearing the life of San Millán (st. 2 cd). The climax of the poem (st. 362–481) recounts the origin of the tithe, justifies its continuance, and instructs the debtor towns (many of which he names) to pay the tribute owed to the saint for his miraculous intervention in battle.

Santo Domingo, based on the late eleventh-century *Vita Beati Dominici* by Grimaldus, narrates the life of another local saint. Once a hermit in San Millán de Suso as well as a monk and prior of its monastery, the saint became abbot of the monastery at Silos, which later (1190) signed a pact of mutual help and cooperation with San Millán; the renewal of this agreement in 1236 may have been the occasion for the composition of *Santo Domingo*. While there is no request for tributes such as that in *San Millán*, Berceo nonetheless reveals his desire to attract pilgrims to Silos by urging those who wish to know more of the saint's miracles to go to that monastery (st. 385–386).

Santa Oria, composed in his old age (st. 2 c), deals with a recluse unknown outside La Rioja but closely associated with San Millán de Suso; indeed, the poet gives directions to the saint's tomb near the monastery (st. 180–182). The most lyrical and allegorical of the hagiographic works, *Santa Oria* relates not the saint's miracles but three heavenly visions. While Berceo indicates that his poem is based on a narrative by Oria's confessor Muño, no source has yet been identified. Although most critics accept the theory of a lost eleventh-century *Vita Beatae Aureae*, Walsh, noting differences from the other hagiographic works, argues that *Santa Oria* draws heavily on otherworld literature as well as saints' legends and that it is primarily Berceo's own creation.

San Lorenzo, Berceo's only incomplete work, follows the structure of a *passio* rather than a *vita*. The poem breaks off in the middle of St. Lawrence's prayer during his martyrdom, suggesting that it was interrupted by the poet's own death. Dutton contends that there was a cult to the saint at San Millán related to a hermitage on nearby Pico de San Lorenzo, and he proposes that the missing portion would have made clear the connection between the monastery and the hermitage. Although the source is unknown, Pompilio Tesauro identifies the *Passio Polychroni* as the closest model.

Dutton believes that the Marian poems, like the saints' lives, are part of Berceo's propagandistic work, arguing that they do not reflect devotion to a universal figure of the Virgin but to the cult of Our Lady of March established in the tenth century at San Millán de Yuso. Dutton thinks that the Marian works, unlike the hagiographic poems, were not meant to attract pilgrims but to instruct and entertain them once they had arrived.

Some scholars have suggested that *Duelo*, because of its dramatic nature, is based on a lost French mystery or a Latin liturgical drama. Nonetheless, the most probable source of *Duelo* (a narrative of the Easter vigil of the Virgin as she tells her sorrows to St. Bernard of Clairvaux) is an apocryphal sermon of St. Bernard similar to the one found in Migne's *Patrologia latina*. The poem contains a song (*¡Eya velar!*) of the Jewish sentries ordered to guard the sepulchre. This early example of Castilian lyric, which is not composed in *cuaderna vía*, has been the subject of some debate: convinced that the verses are misordered, several scholars have tried to reconstruct the song based on parallel structure; others have rejected this reordering, arguing that the canticle is an imitation of a liturgical chant and that confusion may be eliminated if the stanzas are divided into antiphonal parts.

The content of *Loores* is diverse: lyrical exaltations of the Virgin at the beginning and end of the poem enclose a brief narrative of the life of Jesus as well as of various events from the Old and New Testaments. No source has been identified for the poem, and it seems likely that it is based on Berceo's knowledge of the Bible.

The source of *Milagros* is a lost collection of *miracula* similar to Royal Library of Copenhagen MS Thott 128. Berceo uses twenty four of the twenty eight miracles found there, adding one ("La iglesia robada") which occurs in Spain and may derive from oral traditions. The miracles fall into three categories (reward and punishment, forgiveness, conversion or spiritual crisis), and have as their premise devotion to the Virgin. The allegorical introduction, apparently an origi-

nal composition based on common motifs, ties together the twenty-five miracles. As Michael Gerli confirms, the introduction traces the fall and salvation of mankind, while the miracles narrate the fall and salvation of individuals. Thus the introduction and miracles illustrate the redemptive role of the Virgin: through Her, original sin (introduction) and actual sin (miracles) are forgiven.

The first of the liturgical-doctrinal works, *Sacrificio*, is, with the exception of *Milagros*, Berceo's most allegorical poem. Dutton identifies the source of this poem as National Library of Madrid manuscript 298, which is a commentary on the mass solidly within the exegetic tradition. The three *Himnos*, each seven strophes long, are vernacular translations of *Veni Creator Spiritus*, *Ave Maris Stella*, and *Christe, qui lux est et dies*. *Signos*, a sermon in verse, treats the common medieval theme of the fifteen signs of the Apocalypse. The first twenty two strophes derive from a Latin poem in *cuaderna vía* by St. Jerónimo; the source of the remaining fifty five strophes is unknown, but Dutton suggests that they may be attributed to an extended version of the Latin poem used by Berceo.

Once portrayed in literary histories as a simple country priest, Berceo is now viewed as an educated and complex individual who, desiring to promote his monastery, skillfully transforms Latin texts (most of these of special interest to San Millán) into vernacular poetry intended for oral presentation. In order to reach a rural public accustomed to the *cantares*, Berceo uses rustic imagery and appropriates many techniques of the *juglar's* (minstrel's) art. This strategy may be seen clearly in *San Millán* where he not only uses juglar-esque formulae and epithets but portrays the saint as both a divine peasant and an epic hero; and, although Berceo occasionally criticizes juglares, he refers to himself in *Santo Domingo* as God's juglar and to his poem as a *gesta* (compilation of deeds).

BERENGUELA

Berenguela (1180–1246) was the firstborn child of Alfonso VIII and Eleanor of England. After the death in 1181 of a son, Sancho, and the subsequent births of more daughters, Alfonso VIII proclaimed Berenguela his heir at the *curía* at San Esteban de Gormaz in 1187. She was betrothed to Conrad, son of Frederick Barbarossa, at the *curía* of Carrión in 1188. There Alfonso VIII knighted Conrad and recognized Berenguela and Conrad as his heirs in the absence of male offspring. But in November 1189 a son, Fernando, was born to Alfonso and Eleanor. The birth of Fernando quashed Conrad's aspirations to the throne of Castile, and his betrothal to Berenguela was annulled.

Berenguela married Alfonso IX of León (1188–1230) in Valladolid in 1197. Her parents and Alfonso IX agreed to the match in order to end a state of war that had existed between Castile and León since Alfonso VIII's defeat at Alarcos in 1195. One of the issues in the peace negotiations were castles claimed by both Castile and León. The two sides reached a compromise by endowing Berenguela with the castles and lands under contention between Castile and León. At Palencia in 1199 Alfonso IX settled thirty-one castles on Berenguela: San Pelayo de Loyo, Aguilar de Mola, Alba de Bunel, Candrei, and Aguilar de Pedrayo in Galicia; Oviedo, Siero, Aguilar, Gozón, Corel, La Isla, Lugaz, Ventosa, Buanga, Miranda de Nieva, Burón, Peñafiel de Aler, and Santa Cruz de Tineo in Asturias; Colle, Portilla, Alión, and Peñafiel in Somoza; and Vega, Castro Gonzalo, Valencia, Cabrerros, Castro de los Judíos de Mayorga, Villalugán, Castroverde, Mansilla, and Astorga in Campos. As part of the agreement, the castles would revert to León if Berenguela predeceased Alfonso; but if she had a son, he would inherit all his mother's property.

Although the marriage and the agreement ended the state of war between Castile and León, Pope Innocent III excommunicated Berenguela and Alfonso IX in 1198 because Berenguela was Alfonso IX's first cousin once removed; therefore, they were related within the prohibited degrees of consanguinity. Innocent remained adamant when the Leonese attempted to procure a dispensation for the marriage. Even though the pope had imposed an interdict on the married couple, the pair did not separate until 1204 when the papal excommunication was lifted. The lands and castles settled on Berenguela as part of the marriage

treaty became the major issue in the separation. Innocent III insisted that since the castles were Berenguela's dowry and dower, they had to be returned because a marriage had not taken place. This stance revived the animosity between León and Castile, but the Treaty of Cabreros in 1206 endowed Berenguela's oldest son, Fernando, with the lands and castles she had received from her father and husband. Berenguela received an annual income of 8,000 *maravedís* and retained the title of queen of León. Alfonso IX made further provisions for her maintenance when he visited her in Burgos in 1207, and the treaty of Valladolid in 1209 between Castile and León bestowed more properties on her. These would go to Fernando upon her death, thus resolving the conflicts created by the annulment.

Berenguela's marriage with Alfonso IX produced four surviving children: Berenguela, Constanza, Fernando III of Castile-León (1201–1252), and Alfonso de Molina. Another daughter, Eleanor, died in 1202 and was buried in the church of San Isidro in León. Constanza became a nun in Las Huelgas and died in 1242. After Berenguela's marriage was annulled in 1204, the pope declared the offspring of the marriage illegitimate, but as part of the Treaty of Cabreros in 1206, Alfonso IX settled the succession to the Leonese throne first on Fernando and then on his younger brother Alfonso de Molina. After the separation, Berenguela and her children returned to Alfonso VIII's court in Castile, where she and her sons witnessed charters of the royal convent of Las Huelgas. Berenguela also wrote a letter to her sister Blanche of Castile describing Alfonso VIII's victory at Las Navas de Tolosa in 1212.

Upon the death of Alfonso VIII and Eleanor in 1214, Berenguela acted as regent for her younger brother Enrique I (r. 1214–1217), her brother Fernando having died in 1211. Alfonso VIII's will had initially named Eleanor as regent, but she had survived her husband only by a few weeks. Berenguela assumed her mother's place with the consent of the other regents named in Alfonso's will, taking custody of Enrique and the governance of the realm. But the Lara family, led by Count Alvaro Núñez de Lara, sought the custody of Enrique and forced Berenguela to surrender him to them in 1215. Berenguela, fearing a nobiliary rebellion, surrendered Enrique but named certain conditions. Count Alvaro did not heed Berenguela's restrictions, and a civil war broke out between Berenguela and the Laras. The Laras also alienated the Haro family and the Castilian church, which excommunicated Count Alvaro in 1215. As relations worsened, Berenguela sent her sons to their father's court in León.

In contravention of Berenguela's conditions, Count Alvaro planned to marry the twelve-year-old

Enrique to a Portuguese princess, Doña Mafalda, aged twenty-one, in August of 1215. Berenguela used the Church to block the marriage by notifying Innocent III that the couple were related within the prohibited degrees. Berenguela tried to take Enrique from the Laras, but her attempts failed. Alvaro prepared to go to war against the queen and her followers in 1217.

Enrique, however, died in an accident in June 1217. The count unsuccessfully tried to keep it a secret from Berenguela, who nevertheless found out about Enrique's death. She summoned her son Fernando to join her in Castile, keeping her intentions secret from Alfonso IX. The Castilians recognized Berenguela as the heir to the throne, but in an assembly at Valladolid she ceded her right to the throne to her son, Fernando III (r. 1217–1252). Berenguela then arranged his marriage to Beatrice, daughter of Philip of Swabia and a granddaughter of Frederick Barbarossa.

In order to obtain the throne of León for her son upon Alfonso's death in 1230, Berenguela negotiated with Alfonso IX's other surviving wife, Teresa of Portugal. Both of Alfonso IX's marriages ended in annulment, and upon his death he was survived by two sets of children: his two daughters with Teresa of Portugal and his four offspring with Berenguela. Berenguela and Teresa reached a settlement in Benavente on 11 December 1230. According to the terms of the settlement, Teresa's two daughters renounced their claim in return for a pension, enabling Fernando III to ascend to his father's throne. This agreement achieved the permanent union of the crowns of Castile and León.

Throughout the rest of her long life, Berenguela remained her son's chief adviser, retaining power and influence in the affairs of the kingdom. Berenguela's role in Fernando's reign is comparable to the part her sister, Blanche of Castile, played in France with her son Louis IX. The two differ, however, because unlike Blanche, Berenguela had a recognized claim to the throne her son occupied. The intitulation of Fernando's documents included Berenguela's formal assent to his alienation of royal properties and income. The *Chronica latina de los reyes de Castilla* and the *Historia* of Rodrigo Jiménez de Rada credit her with an active role in assisting Fernando's rule and facilitating his campaigns. Berenguela also commissioned Lucas, bishop of Túy, to write the *Chronicon mundi*. Berenguela died in 1246 and was buried in the convent of Las Huelgas.

BERGUEDÀ, GUILLEM DE

Guillem de Berguedà (1138–1192/96), a Catalan troubadour, was named after his father, the viscount of Berguedà. Guillem was not so much a professional poet as an important feudal lord who used poetry mainly for his personal benefit. Most of his thirty-one poems (another one is of dubious attribution), probably written from 1370 on, in a perfect Occitan, are *sirventes* (political or satirical song) closely related to his violent, itinerant life. They are sometimes a document of the everyday feudal struggle and, together with those written by his friend Bertran de Born, are among the best of the genre used as a political weapon. Among his enemies, we even find King Alfonso II (el Casto) and some of the most powerful noblemen of his age, such as the viscount Ramon Folc de Cardona, killed by Guillem in 1175. That also tells us something about the ferocity of Guillem's poetic attacks, in which he would introduce an element of personal cruelty, mocking his rivals' physical defects with deadly effect or accusing them of homosexuality or rape. Guillem had a great gift for caricature, as can especially be seen in the cycles addressed to Pere de Berga Bishop of Urgell, and to Ponç de Mataplana, but he was above all a brilliant poet, witty enough to popularize his satires by modeling them on popular songs, using, for example, a children's refrain to reinforce the humor. His moving *Consiros cant e planc e plor* for Ponç de Mataplana's death confirms Guillem's individuality: abhorring his past behavior, he substituted religious *planctus* conventionality for a personal courtly paradise. Guillem's medieval fame, though somehow related to a love legend, gave him status among the great troubadours, and the most copied of his four love poems (*Qan vei lo temps camjar e refrezir*) was still quoted by Jordi de Sant Jordi in the fifteenth century.

BERNÁLDEZ, ANDRÉS

Chronicler of the reign of the Catholic Monarchs. There are few known facts about Bernáldez's life. What little is known is recorded by Bernáldez himself in his work and is summarized in the introduction to Gómez Moreno's and Mata Carriazo's edition of Bernáldez's history, which the editors name *Memorias del reinado de los Reyes Católicos*. Known as *El cura de Los Palacios*, Bernáldez was chaplain to Diego de Deza, the archbishop of Seville who later became the inquisitor general of Castile. An "Old Christian" (*cris-*

tiano viejo), Bernáldez was born in the province of León around 1454 and became curate of the town of Los Palacios near Seville in 1488, where he served until his death in 1516. His chronicle of the Catholic Kings, which Rodrigo Caro (1573–1647), the antiquarian from Seville, claimed was written as an eyewitness account, provides a particularly interesting description of the events leading up to the expulsion of the Jews. Bernáldez made extensive use of Fernando del Pulgar's work as a source, especially Pulgar's *Letras*, which circulated independently of Pulgar's *Crónica*.

BERNARD DE SAUVETOT, ARCHBISHOP OF TOLEDO

The first archbishop of the primatial see of Iberia after the reconquest of Toledo by Alfonso VI of León-Castile in May of 1085, Bernard was chosen for that post by October 1086 and held it until his death in April 1125. He secured papal recognition for his own selection, for the restored primatial dignity of Toledo in the peninsula, and for a reconstituted archepiscopal province that included jurisdiction over all sees in Iberia whose proper metropolitan see still lay within Muslim-controlled territory. Bernard was, additionally, the chief counselor and usual companion of Alfonso VI of León-Castile (1065–1109) and of the latter's daughter and successor, Urraca I (1109–1126).

Bernard de Sauvetot was French by birth and had entered the Cluniac monastery of Orens about 1070, served at Cluny itself (becoming chamberlain there), and returned to St. Orens as prior about 1078. When Alfonso VI requested the assistance of the Cluniac abbot Hugh the Great, the latter dispatched Bernard to the peninsula and Alfonso VI made him abbot of the royal monastery and pantheon of Sahagún in 1080. As archbishop of Toledo, Bernard recruited Cluniac monks, from whom he fashioned the cathedral chapter of Toledo. Later he was to use his influence and that of the king to promote many of these French canons to the cathedral sees of Braga, Coimbra, Palencia, Segovia, Burgo de Osma, and Sigüenza. He himself was succeeded by one of them at Toledo.

BERNARDUS COMPOSTELLANUS ANTIQUUS

Bernardus's birthdate and birth place are unknown. Between 1183 and 1200 there are references to him in documents from Santiago de Compostela, where he was archdeacon. Around 1200 he left Santiago, heading to the Roman Curia. He studied in Bologna, and among his masters was the civil law expert Azzo. He was also a member of the Vicenza school, which existed only briefly from 1204 to 1209. His writings include: (1) the *Collectio Romana*, containing letters from the first ten years of Pope Innocence III's pontificate; (2) *Apparatus* to the Decree of Gratian; (3) appendices and annotations to Juan Teutónico's *Glossa Ordinaria* on the Decree of Gratian; (4) glosses on the *Compilatio prima antiqua*, written from 1205 to 1206 (glosses on the *Compilatio secunda antique* were attributed to him in the fourteenth century, though no evidence has been found that supports this claim); and (5) *Quaestiones disputatae*, possibly written in Vicenza. After 1217, there is no record of Bernardus's presence in Italy, or of his academic activity. Bernardus has been much more esteemed by modern scholars than he was by his contemporaries; this is surely due to the fact that the *Collectio Romana*, containing letters that the church leadership did not consider as precedents of canon law, was not to the Curia's liking.

BESALÚ, RAMON VIDAL DE

Catalan troubadour named after a town in the province of Girona. Only his works give evidence of his professional links with some of the most important peninsular courts of the late twelfth century and the earlier thirteenth, such as those of Alfonso I and Pedro I of Aragón or Alfonso VIII of Castile. Vidal is well known

for having written the earliest Romance language grammatical treatise (*Las rasos de trobar*, not after 1213), which, in fact, mainly deals with some aspects of Occitan as a poetic language to prevent his (Catalan) contemporaries from making mistakes, especially regarding the case system. Beyond some precious remarks on the use and the meaning of poetry (including folksongs), *Las rasos* somehow seems to be a reaction that nevertheless points to the decline of troubadour poetry, as is continued by Jofre de Foixà's *Regles de trobar* (1290) and other Catalan treatises. The same preoccupation is also to be found in the boastful erudition of Vidal's two didactic verse poems. Both of them show his interest in the art of *trobar* (make poetry) as well as in praising his favorite courts from the viewpoint of a *laudator temporis actii*, as in *Abrils issi'e mays intrava* (after 1199), where commonplace lament leads to a broad survey of the troubadour courtly environment in Vidal's time and to an *ensenhamen* (poetic lesson) on *joglaria* (minstrelsy). In *So fo el temps c'om era jais* (not after 1213), a conventional love judgment turns into a description of Huguet de Mataplana's court and a wide selection of troubadour quotations, including three of his own. The *Castia gilos* (after 1214), written in *novas* (a type of verse), is his only narrative, yet it has a similar framework. As though to prove the vitality of the troubadour tradition, Vidal succeeded in telling wittily a *fabliau* plot—the jealous husband deceived—adapted to his courtly audience.

BESTIARY

Bestiary is a name given to popular medieval works of ancient provenance in which the physical and behavioral characteristics of animals, some real, some legendary, are related to Christian ethics, or to some basic theological concept such as the incarnation, salvation, or redemption. The visual impact of such allegory on the minds of the faithful is reflected in the most enduring examples of Christian iconography, such as the symbolism of the lion, the unicorn, the phoenix, the whale, and the pelican, which have their origin in these animal books.

While the ultimate source of the bestiary's animal lore is lost in antiquity, in the Christian era it takes

definitive form in a book called *Physiologus*. The early history of this text is one of the most complicated imaginable, for certain details found in the Greek had also been picked up by Pliny himself, subsequently to be incorporated into authoritative natural history.

There are no extant manuscript versions of a *Physiologus* from an early date, but secondary evidence points to a second-century text in Greek and a fourth-century text in Latin; translations into Ethiopian and Armenian appeared in the fifth century; the oldest translation to a European vernacular is an Old English version of the eighth century. By this time, there is a tendency to treat the animals without the moralizations: Isidore himself uses the traditional descriptions from the *Physiologus*, but not the moralizations, and as early as the eighth century we have a Latin text of the *Physiologus* without the ethical and allegorical commentary.

In the encyclopedic age of the twelfth and thirteenth centuries, the natural history of the animals, as expanded by Isidore and further amplified by material from Pliny or from the traditional encyclopedic works of Cassiodorus or Martianus Capella, was incorporated into the collection: the forty-odd beasts in the *Physiologus* became as many as 150, and the common designation of the book came to be "bestiary." In this great century of the emerging vernaculars, translations were made into nearly every European language, with Old High German versions from the eleventh and twelfth centuries, and a proliferation of bestiaries in French during the same period. It was thus primarily a northern phenomenon: England, France, Germany.

Though secondary evidence gives testimony to its existence, due to the absence of manuscript witness the medieval Spanish bestiary has been characterized as "lost." However, while no autonomous text survives, the bestiary was in fact known in the Iberian Peninsula through its inclusion, intact, in Brunetto Latini's *Livre dou Tresor*. This work was written originally in French, but there are literally dozens of medieval manuscripts of translations into Castilian, Catalan, and Aragónese (complete editions of the medieval Castilian and Catalan versions of the *Livre dou Tresor* have been done by Spurgeon Baldwin and Curt Wittlin, respectively).

BIBLE, JEWISH

Texts

Jews in Spain from the earliest time were very careful about the exactitude of their biblical texts. One of the earliest and most important manuscripts was known as the Hilleli (variously, Hillali) codex. Abraham Zacut, the famous astronomer and chronicler, relates that in the attack in León in 1196 (against the castle of the Jews), the Jews removed this manuscript, which was written some six hundred years earlier (596) by the scribe Moses b. Hillel. Zacut also mentions that he saw the section of the prophets of that codex, which was taken out by Jews expelled from Portugal and sold in Bougie (Boujaia, in Algeria). The same manuscript was cited already by Menahem b. Saruq in the tenth century, and frequently by scholars after that. In the thirteenth century or earlier, it was in Toledo, and from there copies were made in Burgos, Provence, and elsewhere. As late as the fifteenth century, it was still cited by a scholar of Toledo, as well (apparently) by a scribe in Zaragoza who made a copy from it.

Moses b. Maimon (Maimonides), after he left al-Andalus for Egypt, utilized the famous Aleppo Codex for his laws on the writing of Bible manuscripts (this is established by the Spanish edition and Oxford manuscript of his code).

Another important manuscript was the so-called Torah of Ezra of Burgos, cited by Jewish authorities. When Enrique II entered Burgos, he imposed a huge tax on the Jews (1366) and they had to sell all the Torah ornaments except for those of this scroll. In 1391, Jews of Burgos were asked to swear an oath on their *Tora de Yzra* not to sell arms.

Many individual Jews wrote their own copies of Bibles, and an interesting example is the extant Paris manuscript written in 1207 for the father of the famous Meir Abulafia, again in Burgos (Meir himself was instrumental in the diffusion of copies of the Codex Hilleli). The famous rabbi Nissim b. Reuben Gerundi inscribed important historical information on two Torah scrolls, one that he wrote in 1336 and gave to the community of Barcelona, and another that had belonged to his father and to which he appended a colophon in 1391.

While there are today many Hebrew biblical manuscripts in Spain, apparently there is only one that actually belonged to a Jewish *aljama* (community) that of Vitoria, and a small miniature scroll, as well as a few fragments. On the other hand, there are (or were—some may have been destroyed by the Nazis) several in various libraries of the world, including one

written by the famous Shem Tov Ibn Gaon in Soria in 1313.

These manuscripts, as well as the early editions of Spanish Hebrew (and non-Hebrew translations) biblical texts, have obvious importance both for the history of the text as well as the eventual creation of a critical edition of the Bible.

Commentaries

Menahem b. Saruq in the tenth century apparently composed the first work in Spain dealing specifically with the Bible, although it was a dictionary rather than a commentary per se. This work, *Mahberet*, became famous due to its citation by Rashi (Solomon b. Isaac), famous commentator of France and Germany, and because it aroused the opposition of the important school of Hebrew grammarians centered around Córdoba and Lucena, and whose scientific investigation of Hebrew made possible the development of exegesis of the text. Both Samuel Ibn Naghrillah the famous poet and prime minister of the Muslim kingdom of Granada, and the philosopher and poet Solomon Ibn Gabirol composed commentaries on parts of the Bible, which have been preserved only in citations by later authorities.

The most important commentator of the Spanish tradition—though he spent much of his life traveling outside Spain—was Abraham Ibn Ezra. His commentaries exhibit a solid base of Hebrew grammar and good sense, replete with criticisms of some of his predecessors, from al-Andalus and other lands (Moses Ibn Chicattillah is particularly important), as well as a remarkably “modern” skepticism as to the divine origin of parts of the Torah and the traditional authorship of certain books of the Bible.

Bahya b. Asher of Zaragoza, a fourteenth-century author of a qabbalistic commentary on the Torah, claimed that Maimonides had also composed a commentary, but this is extremely doubtful since no one else mentions such a work (nevertheless, Maimonides’ frequent analysis, allegorical and otherwise, of biblical statements made his legal and philosophical writings an important source for biblical interpretation in Spain).

Other important eleventh-century commentators include Judah Ibn Balcam (whose commentaries are in Judeo-Arabic) and Isaac Ibn Yashush, who also expressed skepticism about the Mosaic authorship of parts of Genesis.

In Aragón-Catalonia, under the influence of cabala, biblical commentary took mostly a homiletical-mystical direction. Most famous of these was Moses b. Nahman (Nahmanides), followed by the aforementioned Bahya b. Asher. However, Ibn Adret included

some extremely important remarks on the Bible in his *responsa* and in scattered comments in his other writings. “Pietists” of the next generation, such as Nissim b. Reuben and Jonah b. Abraham Gerundi, tended to interpret the Bible along strictly homiletic lines.

In the thirteenth century in Castile, David Qimhi of Narbonne wrote several of his commentaries, there were marked by the careful grammatical analysis characteristic of Ibn Ezra (although with a good many flighty allegorical digressions and considerable anti-Christian polemic). The “pietistic” homiletical approach was firmly established in the fourteenth and fifteenth centuries. Jacob b. Asher of Toledo, son of the famous German scholar who became head rabbi there, typifies this in his Torah commentary, as does the far more important and interesting commentator Joseph Ibn Nahmias. By then, of course, the *Zohar*, composed chiefly or entirely by Moses de León, and qabbalistic works of that school also exercised a profound influence on biblical commentary. Finally, in the fifteenth and early sixteenth century, the work of allegorists like Isaac ‘Arama and especially Isaac Abravanel (not composed until after the Expulsion) must be mentioned, of course. Rationalism had given way to homiletic flights of fancy.

BIBLE IN SPAIN, THE MORALIZED

Moralized Bibles were an essentially French fashion that lasted from the thirteenth to the fifteenth centuries. Their highly selective and fragmentary scriptural texts, their popularizing interpretive glosses or “moralizations” based on the work of twelfth-century commentators like Hugh of St. Cher and the *Glossa Ordinaria*, and most conspicuously their vast programs of illuminations are what separate moralized Bibles from their more common cousins, the hundreds of medieval historiated Bibles and dozens of *Bibliae pauperum*. The most famous *Bibles moralisées* (of the fourteen now extant and distributed among eighteen codices) were executed in the Parisian style in the first half of the thirteenth century and linked to commissions by King Louis IX, his mother Blanche (Blanca) of Castile, and other members of his family. One distinguished *Biblia moralizada* was copied and translated into Castilian in Spain.

There are two preeminent three-volume sets of Latin moralized bibles copied in France and covering the entire Christian scriptures. One set is now divided between Oxford (Bodley 270b, reported as having been “acquired” by Sir Christopher Haydon during the sack of Cádiz in 1569), Paris (Bibliothèque Nationale Latin MS. 11560), and London (British Library, Harley 1526–1527).

Another complete three-volume set is still together in the treasury of the Cathedral of Toledo. The final quire of the last volume (one of the very few imperfections in the Toledo set) had already been detached from its binding by the beginning of the fifteenth century and currently forms part of the holdings of the Pierpont Morgan Library in New York. Since Louis IX and Blanche of Castile are shown in the closing illumination of the Morgan fragment as equals, the moralized Bible now in Toledo must have been executed during her regency while Louis was still a minor, between 1226 and 1236. The reasons for the loss of this *cuaderno* with the royal portraits are unknown, but since the French throne later supported the claims of the heirs of Fernando de la Cerda (1255–1275) to succeed their grandfather, Alfonso X (1221–1284), the almost surgical extraction of this quire could have been already performed during the reign of Sancho IV (1284–1294), Alfonso’s second son who forcibly replaced his father as king.

Diplomatic and dynastic ties between Spain and France were especially strong in the early thirteenth century. Blanche of Castile was the daughter of Alfonso VIII of Castile and wife of Louis VIII of France, which made her son Louis IX cousin to Alfonso X. It is not unreasonable to suppose that the Toledo *bible moralisée* would have made a fitting coronation present for the young Spanish scholar and prince in 1252, or perhaps one of the dynastic exchange gifts when Alfonso’s eldest son and heir betrothed Louis IX’s daughter Blanca in 1266, or when he married her in 1269. Historians held that the common name of this bible, the *Biblia de San Luis*, arose from its association either with King Louis (r. 1236–1270) or with St. Louis of Anjou (1274–1297), bishop of Toulouse, one-time prisoner of Alfonso III of Aragón and later prisoner of Jaime II of Aragón. If these volumes acquired their name by passing through the hands of Bishop St. Louis, then the date of their arrival in Spain would have been considerably later, well after Alfonso’s death, which would leave unexplained the avenues of physical transmission. The evidence from the testament of Alfonso X dated 21 January 1284 resolves this issue in favor of his personal ownership. The next undisputed mention of the great moralized French Bible is in an inventory of the cathedral of Toledo from

1539, although there are apparent witnesses as early as 1466 and perhaps earlier.

The great *Biblia de San Luis* contains an astonishing range of miniatures, some thirteen thousand in the three volumes, and was regarded by the learned king as both an important dynastic and devotional object. It is surprising therefore that this vast exemplar of high French Gothic manuscript illumination exercised little appreciable influence in terms of chromatic palette, composition, or theme on any the Alfonsine corpus of miniatures.

Finally, there is a Spanish *Biblia moralizada* (Biblioteca Nacional de Madrid 10232), also known as the *Biblia romanceada en latín y castellano* or the *Biblia de Osuna*, after a subsequent owner. It is a massive project, almost entirely without illuminations, that includes a vernacular translation of the allegorical interpretations of scriptural passages. The codex was executed in a three-column format in the late fourteenth or early fifteenth century for someone who knew this French source well and who also had authority over it for the time that it took to execute the bilingual manuscript—perhaps one of the archbishops of Toledo, as many of them well-known bibliophiles. The importance of this moralized Bible resides in its independent translation of sacred scriptures and glosses. The illuminations were omitted not by accident, but probably because executing them was beyond the means of the patron and the capabilities of the local craftsmen. There are occasional expansions and extrapolations on the Latin source material in the Spanish and a few incidences of brief descriptions of the pictures in the source text. The *Biblia de Osuna* was apparently meant as a companion or reader’s copy to protect the great *Biblia de San Luis* from unnecessary use.

BIBLE TRANSLATIONS

Castilian from Vulgate

The first known Castilian version of the Bible from the Vulgate goes back to the middle of the thirteenth century: as the oldest monument of literary prose, it proves that Castilian was no longer merely an oral medium between Arabic and Latin (as the vernacular had been in the "Toledo school of translators") but had come into its own as a written language. The manuscripts in which it has come down to us, though directly complementary and not complete, are Escorial I.1.8 (abbreviated E⁸) and I.1.6 (E⁶), transcribed, the latter in the original Castilian probably soon after composition (the New Testament possibly a few years later), the latter by a Navarro-Aragóñese copyist of the early fifteenth century (the missing part of Genesis-Leviticus 6.7, is supplied in Castilian, by Escorial Y-1-6 as part of Alfonso X's *General Estoria* vide infra). Both E⁸ and E⁶ show some old readings from the earlier Hispanic tradition of the Latin Bible; nevertheless they stem substantially from the Vulgate in its thirteenth-century stage, known as the Parisian Bible because of the *librarii* of the Sorbonne who circulated it (collated by Wordsworth and White in their edition of the New Testament, and by the Benedictines of San Gerolamo in Rome in the yet unfinished edition of the Old Testament).

The Psalter in E⁸ occupies a place apart as a version allegedly from Hebrew ("según cuemos está en el ebraigo"), attributed to Hermannus Alemannus, whom we know as the translator into Latin of Arabic (Averrōan) commentaries on Aristotle's *Nicomachean Ethics* and *Rhetorics*. Whether the attribution is trustworthy or not, it is significant that we find a biblical version associated with a scholar whose activity is attested to in Toledo for the years 1240 and 1256. As to the original, on close scrutiny it proves to be a conflation of the Latin Psalter, especially the Jerominian *iuxta hebraeos*, and the Hebrew Massoretic text (Morreale, 1980). It is interspersed with moral glosses yet unidentified, none allegorical.

A second translation of several biblical books appears in the framework of the *General estoria* of Alfonso X of Castile, a history of mankind since Creation

that the king planned along with his *Primera Crónica General* or *Estoria de España* (1270), in which the story of Moses was told in one brief chapter as the background for the settlement of Spain by Japhet's son Tubal. This universal history was to be built around the core of a paraphrased Bible on the pattern of Peter Comestor's *Historia Scholastica* (along with biblical glosses, Josephus, St. Augustine, Beda, Rabanus Maurus, and other sources), and combined with secular history, following the chronology of Eusebius' *Chronicle*. Literal renderings of Scripture were used for the canticles and the benedictions of Moses in Exodus 1: 15; and Deuteronomy 32, and 33:2–29, the Psalter, and Wisdom books. While in the paraphrased parts biblical matter is adapted to a more current style, avoiding parataxis and repetition, and often changing direct into indirect speech, the direct translations are a mixture of word-for-word renderings and circumlocutions, which make the Alphonsine version in many ways inferior to the preceding E⁶-E⁸ Bible. They point to a *Biblia romanceada* text that may have come earlier, and, in any case, ready for use. No traces of a non-Christian hand are found in these sections, in spite of the king's proverbial tolerance toward other religions, and the well-known part Muslims and Jews played in his works. The underlying text is of the same type as E⁶-E⁸ but not the same.

According to Alfonso's purpose (see the prologue of the *Crónica de España*), the authors of the *General estoria* did their best to explain the structure of sacred history by showing the unity of its parts. At the beginning of each book they took pains to translate Jerome's introductions and other prefatory matter, which give insights into various aspects of the biblical books and their early versions. The result was a monumental work, and much larger than the *Bible historiale* composed ten or twelve years later by Guyart des Moulins (as the largest of its kind produced in the Middle Ages, it assured the presence of the Old Testament in Castilian culture).

The biblical matter was thus distributed among the first four volumes of equal size: part 1, Pentateuch; part 2, Kings; part 3, Song of Songs, Proverbs, Wisdom, Ecclesiastes (in Salomon's alleged "autobiographical" order), and Psalms, Part 4 Joel and Isaiah, Hosea, Amos, Jonah, Tobit, Job, Ezekiel, and Chronicles with IV Kings intercalated at various points; part 4, Daniel, Obdiah, Zephaniah, Jeremiah, Lamentations, Baruch, Habakkuk, Judith, Ezra, Nehemiah, Haggai, Zechariah, Esther, and a literal translation of Ecclesiasticus. Parts 1 and 4 stem from the Alphonsine scriptorium (Madrid, Biblioteca Nacional, MS 816, and Vatican Library Latin MS 539, dated 1280). For part 5 we have to turn to Escorial I.1.2, which contains

the same books as Vat. Library Latin MS 539, plus Maccabees, and a literal translation of the New Testament (Matt. 18 to Jude), taken over from E⁶, and probably tacked on after the execution of the original plan had ceased. A part 6 is fragmentary and contains paraphrased allusions to the New Testament.

The desire to read Bible history uninterrupted by events alien to it caused some of the later copyists to omit portions of the nonbiblical content. Yet other copyists go back to the literal versions (Esc. Y-I-6, to E⁸, Y-1-8, and I.1.2 to E⁶; in the latter, the order of books of the New Testament are not the same as in the original: they are set in a sequence that we know from the ancient Visigothic manuscripts).

The fourteenth century produced versions of single books such as Job (Escorial b.II.7), whose anonymous author is identified by some as Chancellor Pero López de Ayala; undoubtedly his is a version (made between 1398 and 1407) of sayings from Pope Gregory's *Libri Moraliū or Expositio in Job*, entitled *Las Flores de los Morales de Job* (Madrid, BN 10138; differences of biblical parts are pointed out by M. Morreale, *Hispanic Review* 34 1966).

In López de Ayala's *Rimado de Palacio* (with the second part based on Gregory's *Moralia*), the author bears witness to the Vulgate as a indirect or direct source of quotations (cf. M. M., 1983). Throughout the Middle Ages the Vulgate continued to be the fountainhead from which sprang all paraphrases, in prose and poetry, as well as quotations in doctrinal works such as *Los diez mandamientos*, *Castigos y documentos de Rey don Sancho*, *La Historia de los cuatro doctores*, the *Doctrina de discrición* of Pedro de Vergüe, *La doctrina que dieron a Sarra* by Fernán de Guzman and others, which with their renderings show the influence of the Latin on the Spanish language, first in more vernacular, later in Latinized forms. Nevertheless, some of the former reach present-day speech, such as *mandamiento* (commandment) or *Todopoderoso* (Almighty).

As for Bible translations as such, manuscript tradition takes us to the turn of the fourteenth and the first half of the fifteenth centuries, which is another period of fervent activity inspired not so much by the broad vision of universal history as by a zealous and somewhat indiscriminate erudition. In 1406 a great literary patron ascended to the throne of Castile: Juan II, who is said to have been fond of having Scripture read and its secrets declared to him. At the request of Alfonso de Guzmán, a Franciscan friar began in 1422 to translate the *Postillae* of Nicholas of Lyra. Another ponderous work is known as the *Osuna Bible* (Biblioteca Nacional de Madrid ms. 10232), an adaptation of French *Bibles moralisées illustrées*, with its Latin and

vernacular explanations alongside the biblical text (the Castilian *Biblia moralizada* contains no illustrations, and the instructions for the illumination of the Psalter are mistaken by the copyist or translator for part of the text). Both found their way into the private library of the Marquis of Santillana). The devotion of Isabel I the Catholic and the zeal of the bibliophile Felipe II were responsible for the preservation of most of the biblical manuscripts, bequeathed by the monarch to the Escorial monastery.

The translations, committed by individual noblemen (as dedications and escutcheons show) and carried out presumably for a fee (cf. Bible translations from Hebrew), became more and more unreadable (and unreliable). This is the case of the deuterocanonical books of the early fifteenth-century Bible, contained in Escorial I.1.4 (E⁴).

Royal and ecclesiastical prohibitions give an added insight into the history of translations—not so much the decree of 1233 by Jaime I of Aragón at the Council of Tarragona against all Bibles *in romancio*, since it reiterates a similar decision of the Council of Toulouse in 1229 against the Albigensians, but those of the Inquisition after its establishment in Castile (1478) and Valencia (1484), when vernacular Bibles became its concern, mainly because of the use converted Jews (*conversos*) could make of them.

At first, Psalters and liturgical Gospels and epistles escaped censure, along with the Little offices, containing psalms and biblical passages, and meditations on the Psalms—especially the Penitential Psalms and the Song of Songs. Martín de Lucenas' Gospels, translated at the request of Íñigo López de Mendoza (Biblioteca Nacional de Madrid ms. 9556; Schiff mentions Gospels and Epistles, both as "lost," p. 225), was followed in print by the Aragónese jurist Gonzalo García de Santa María's version of the liturgical Epistles and Gospels, with sermons drawn from the *Postilla super Epistolas et Evangelia* of Guillelmus Parisiensis, 1437 (Salamanca 1493), and the Franciscan Ambrosio Montesino's *Epístolas y Evangelios*, published a few years later upon request of Fernando the Catholic (Toledo, 1512), was reprinted many times, as was his successful *Vita Christi Cartuxano*, the Spanish version of the monumental *Meditationes Vitae Jesu Christi* by the Carthusian monk Ludolph of Saxony (Strasbourg, 1483), itself a harmony of the Gospels derived from the Latin version of Tatian's *Diatesseron*. These and previous *Vitae Christi*, such as that of Francesc Eiximenis, translated into Castilian, or Íñigo López de Mendoza's *Vita Christi por Coplas*, as well as other translations of Psalms and Gospels that fall outside our period, offer plentiful material to study the aftermath of the medieval *Biblia romanceada*.

In the sixteenth century Juan de Valdés marked a turn in his Italian period when he translated the Psalter “from Hebrew,” the Pauline epistles (Romans and 1 Corinthians extant) and the Gospels (Matthew extant) “from Greek” (but not without the help of Erasmus, *Novum Testamentum*, ed. 1527). In 1559 the exiled Casiodoro de Reina bequeathed his *Biblia* (through Cipriano de Valera’s revision, 1602) to Spanish protestants.

They nevertheless fall in line to a certain extent with the oldest peninsular translations, while partial translations of single books and Felipe Scío de San Miguel’s first full version of Scriptures in modern times (1791–94) are their natural heirs (as frequent quotations from medieval Bibles, especially E⁶, in the footnotes also testify). The same holds true to a certain extent for J. M. Bover’s and Cantera Burgos’s Bible from Hebrew (1957). In 1975 the *Nueva biblia española* of Alonso Schökel and Mateos mark a breaking point, in accordance to the recent trend to make the Scriptures “accessible” (and acceptable) to the modern reader.

The intrinsic value of the *Biblia romanceada* as a vehicle of biblical Latin and as a source for the history of Spanish phonetics, morphology, syntax and style, and especially vocabulary has attracted the attention of scholars (L. Mourin and G. De Poerck, Baldwin, Morreale, J. Moreno Bernal).

At the University of Wisconsin-Madison the *Biblia romanceada* is being painstakingly transcribed down to the letter as a source for a planned *Old Spanish Dictionary*. For its edition other criteria have been worked out as regards script, parsing of words, and punctuation.

Since the number of extant texts is much less numerous than in neighboring France (189 signaled by Berger in the *langue d’oïl* alone), scholars would do well to agree on a way of publishing the *Biblia romanceada* in a way that would do justice to its meaning and sounds.

On the other hand, parts of the *General estoria* and works by other medieval authors have been scanned for traces of vocabulary and phraseology reminiscent of the Bible, and a corpus has been inaugurated by the Hebraist García de la Fuente, of the “biblical vocabulary” in medieval authors, but all too often it is as if there were no intermediate sources.

Abundant traces of the *Biblia romanceada* are found in Spanish dictionaries, many of which still subsist in the language, although they find less and less recognition in subsequent editions of the *Academy Dictionary*.

Whatever aspect of the *Biblia roamanceada* is examined, before the advent of the Sixto-Clementine edi-

tion of the Vulgate (1592–1593), care should be taken to reconstruct the stage of transmission of the underlying text, including extra-biblical elements (order of books, chapter division, glosses, and preliminaries). A tentative sample is given by the bilingual Latin-Castilian editions of former research assistants at Padua.

We do not know to what extent the *Biblia romanceada* reached the broader world of the uninitiated, but in any case it is an added testimony of how Spanish cultural and spiritual life was molded by the biblical message, and as such it should be studied in the first place.

Castilian from Hebrew

The extant Bibles translated from Hebrew by Castilian Jews are a scant representation of those actually in existence in medieval Spain, as contemporary references indicate: a contract between Aragónese Jews and the German printer Paul Hurus signed at Calatayud in 1478 mentions the commission of seventy nine large illuminated Castilian Bibles, four on parchment; inter-linear glosses by Rabbi Arragel likewise refer to other translations unknown to us (“*otros romançan . . .*”).

In E⁸ we have seen a Psalter that is said to have been translated from Hebrew by a Christian author; an earlier version from Hebrew, of the first decades of the thirteenth century, is embedded in a guide to the Holy Land, known as the *Fazienda de Ultramar* (with approximately 2,100 verses in longer passages and single quotations, including Tobit and Maccabees.)

Part of the Old Testament, evidently translated from the Massoretic text, could be pieced together (including verbal elucidations) from disputations between Christians (mainly *cristianos nuevos*, or “New Christians”) and Jews.

The same holds true even to a greater extent for translations of original works by Jews, as Maimonides’ *More Nabuchim* (1190), by the Jewish convert Pedro de Toledo (1419–1432), since Maimonides intention was to “juntar e amigar la Santa escritura de Moisés e de los profetas con la muy altíssima escelente filosofía primera e moral e natural” (to join and make compatible the Holy Scripture of Moses, and the Prophets with the most excellent and high primary, moral, and natural philosophies).

As for the Jewish *Biblia romanceada* itself, extant manuscripts are relatively few. Most are found in Spain, at the Escorial Library; four in Madrid, two at the Biblioteca Nacional (BNM), one each at the Academia de la Historia (AC), and one in the Duke of Alba’s private collection. Two are in Portugal. They are designated as follows: Escorial I.1.3, from the Hebrew with a paraphrase of Maccabees (abbreviated E³), the Ajuda

(Lisbon), with Genesis through Judges plus a summary of Maccabees, Esc. 1.1.7 (E⁷): Genesis 8:11–Kings (E⁷), Esc. 1.1.5, (E⁵): Isaiah–Chronicles, Esc. J-ii-19 (E¹⁹): Genesis 25:17–2–Kings 23:4, Evora Public Library cxxi¹⁻², fol. 348 to the end (Evora): Song of Songs, Proverbs, Wisdom, Ecclesiastes; Ac. n. 1: Major and Minor Prophets plus [Maccabees] (Ac¹), MBN ms 10288: Prophets and Lamentations, Chronicles, Psalms, Job, Song of Songs, Ecclesiastes, Proverbs, Lamentations (bis) plus deuterocanonical books from Vg (BN); Esc. I.1.4: OT [Ps and deuterocanonical books from Vg], (E⁴), “Biblia de Alba”: Palacio de Liria, Madrid: OT (Alba).

Of these, E⁷ and E⁵ are complementary; E³ and Ajuda are closely related; part of E⁵ coincides substantially with Evora, E⁵ Judith is almost identical with E¹⁹; Ac¹ belongs to the family of the Alba Bible as regards the Major Prophets, while the Minor Prophets, including the Prologue, bespeak common origin with Biblioteca Nacional, Daniel and its Prologue, with E⁴; the latter in turn is related to Evora and Ac¹; in Biblioteca Nacional Lamentations is transcribed twice from different sources. Due to their composite quality, manuscripts should be collated thoroughly for mutual relations. The tendency, however, has been to publish manuscripts separately, without critical inquiry into the transmission of the texts (cf. eds. E⁴, E¹⁹).

E³ belongs to the late fourteenth century, the others to the first half of the fifteenth. Only one, the Alba Bible, so called from the name of its present owners, bears the name of the translator, Rabbi Arragel of Guajalajara, and the approximate dates 1422–1433; of the others, Evora only is dated 1429.

Only three Old Testaments have survived in their entirety (according to the Hebrew canon): E³, E⁴, and Alba; one represent a second volume, Ac¹, the first one being lost. None are entirely homogeneous, because of translations from the Vulgate or other Christian elements mixed in: Maccabees in E³, Ac¹, E⁴; deuterocanonical books in E⁴ and BN, and even Vulgate Psalms in the former; Vulgate appears on parallel columns in Ac¹.

The service of noblemen, to which Jews were often assigned in the Middle Ages, explains the origin and preservation of the Alba Bible and probably of many of the other texts. Rabbi Arragel undertook the task imposed on him by Luis de Guzmán, Grand Master of the Military Order of Calatrava, who wanted a fresh translation, the older ones being outmoded. Of the Ajuda Bible we are told that it once belonged to a Portuguese king, Afonso II, and later to the Duke of Bragança; E⁴ bears the escutcheon of Ribera, Luma, and Zúñiga; The manuscript of the Biblioteca Nacional de Madrid found its way into the Library of the Mar-

qués de Santillana, who ordered or collected many biblical and patristic works along with translations of Josephus, Plutarch, Livy, and other historians and poets of antiquity. Most of the manuscripts were collected by the devotion of Isabel I the Catholic and the zeal of bibliophile Felipe II, who bequeathed them to the monastic Library of the Escorial.

The genesis of most of the manuscripts explains the large format and the illustrations, particularly varied and interesting in Alba, but also present in E³, Ajuda, and E⁴. This, however, does not exclude the perusal by Jewish readers who were no longer familiar with the Hebrew language. Even more significant for the pursuit of ancestral tradition and religious practice are the translations of prayer books and rituals, unfortunately preserved in even fewer numbers (cf. Yerushalmi).

No systematic study has been undertaken on the underlying Massoretic text and the Targumin. The presence of Targum of Onkelos has been ascertained piecemeal, especially in E¹⁹ (see Gen. 49:9, 12, but also in Gen. 49:25) and elsewhere; that of the Vulgate is detected in E⁴ and Alba (where double translations are often included with the explicit purpose of satisfying readers of both religions).

As for the contents and “message” of Scripture, faithfulness to the letter is responsible for many of the valid interpretations confirmed by modern biblical scholarship (as well as for other readings dismissed today in favor of the old versions, including the Vulgate; see Ps. 17[18], “*quoniam iratus est eis*”). As could be expected, literal translation from Hebrew diminishes the messianic suggestions emphasized by *St. Jerome* (for example, in using the abstract *justicia* or *justedad* instead of *el justo* in Is. 12:3, 45:8, etc.) and does away with the basis for Mariological interpretations of verses such as Genesis 3:15; however, one passage must have been a touchstone for Christian inspection: in Isaiah 7:14, E³, E⁵ and E⁴ have *virgen*; Alba finally allowed *alma* to remain (the manuscript shows evidence of the deletion of *virgen* or *moça*).

As regards other extrabiblical elements, the Hebrew canon (Law and former and latter Prophets, hagiographs, with some divergences) is followed by E³, E¹⁹, E⁷, Alba, and Ac¹. E⁵ shows the chapter division introduced in the Vulgate since 1220. E³ stands out for its commitment to Jewish religious practice; it is marked in the Pentateuch according to the synagogal readings of the *parashiot*, with Exodus 15:1–20 and Numbers 21:18 divided according to the Massoretic prescription (a feature that also appears in E¹⁹).

Alba has an extensive marginal commentary and heterogeneous interlinear glosses and is abundantly illuminated, with extensive preliminaries explaining their

circumstances. Ac¹ bears fragmentary glosses of Hebrew origin, starting with Ezelsiel 13:9, as does the Biblioteca Nacional Bible.

Translation is literal enough to make many Semitic syntactical and even morphological traits evident: more so in E³, E¹⁹, Ac¹, and Evora-E⁵; somewhat less in E⁴ and Alba. Without the interposition of the latinity of Jerome, clauses follow one another in paratactical order. They are continually punctuated by the interjection *ahe* (*hinneh*, i.e., “lo!, behold!”), undeterred by repetitions, and derive different words from the same root, with extraordinary license in word formation. Literalness is inspired by respect for the sacred text; but it also may be due to the sheer routine of rendering the text word by word, as in contemporary translations by Christians, which in the fifteenth century were at their worst; many an error is caused by the interpretation of a root in disregard of context.

A distinctive feature of the Jewish *Biblia romanceada*, on the other hand, is the use of expressions accessible to the Jewish readers, the sum of which is called *ladino* (in order to distinguish it from Judeo-Spanish or *judezmo*), and the sum of which varies, being larger in the more literal type.

The history of the Bible read and translated by Jews would not be complete unless we considered once more the quotations embedded in such works as Rabbi Santob de Carrión’s *Proverbios morales*, and especially the parts of Genesis paraphrased in the versified History of Joseph and his brethren.

Since much textual evidence has been lost, in order to place the representatives of the Jewish *Biblia romanceada* in the right perspective within the Judeo-Spanish tradition, we could have started from the vernacular Bible as the Jews printed it as soon as they saw themselves relatively free to publish and circulate “the Book”; inverting the chronological order, we could have made the most of the testimony of the Constantinople Pentateuch (1547, in Hebrew characters), and the Ferrara Bible (1553, in Latin, black-letter type), named after the towns in which they saw the light (Constantinople and Ferrara, via Venice, were not too far removed from each other in the sixteenth century; Eliezer Soncino, the editor of the Pentateuch, had himself come from Italy, where he had been an assistant of his father Gershom, the well-known printer of Italian, Latin, and Hebrew books).

The substantial identity of the two texts, compatible with clearly distinct interpretation of technical passages, and their editorial policies and partially different destination make them comparable with the two types we have seen in the *Biblia romanceada*. Constantinople was published explicitly for the benefit of Jews to help youth in the synagogal service; Ferrara, with an

eye on Jews as well as on Christian patronage, as its two different dedicatory letters show, was addressed either to the Jewess Gracia Nasi (bearing a list of parashots and haphtarots in some of the copies), or to Duque Hercules II of Ferrara. Constantinople is more slavishly literal and more definitely inclined to the use of ladino expressions; Ferrara allows a little more margin to make the text accessible; hence E³ and E¹⁹ as antecedents of Constantinople, E⁴ and Alba as an example of compromise—both groups, however, at a distance.

The authors of the Ferrara tell us that they had many versions, both ancient and modern, at their disposal; yet they call it a *new translation*. No “original” has been found among the manuscript Bibles circulated in the Iberian Peninsula, and none will be found with all the distinctive elements of the Constantinople and Ferrara: none that carries the word-for-word interlinear translation to such conscious extremes, none with the same proportion allowed to ladino, none following the editorial policies peculiar to BF—vernacular elements supplied in semicircles, asterisks to mark (irregularly) difficult or critical passages, abbreviation of the name of God A[*donay*]. All these fit into the Italian scholarly milieu of the first half of the sixteenth century (prior to the diatribes over Scripture of the Reformation), when the call “back to the original languages” was headed by the Dominican Santes Pagnini, Cardinal Cayetan, and others, in an effort to correct or even substitute the Vulgate with a “more reliable” Latin translation. On the other hand, the translations represented by Constantinople and Ferrara hark back to the *phrasis* of peninsular ancestors in such a way that many have counted the text they represent to the medieval *Biblia romanceada*. The prayer books and rituals printed (in Ferrara 1552; two in Venice 1552) allow us to assume a tradition of long standing, probably oral, which explains the similarity of the biblical texts. Thus “the venerable and sententious language” that was natural to the Jews of old was handed down to the Jewish diaspora, in the many editions of the Ferrara, or part of the same.

Catalan

The earliest testimony of biblical texts in Catalan are found in homilies; in fact, the history of Catalan prose opens with a short fragment of a collection of sermons, strongly influenced by Provençal, known as the *Homelies d’Organyá* (end of the twelfth century), in which the Gospels for several Sundays are explained mainly according to the moral meaning. Another series of homiletic materials is preserved in Barcelona (Biblioteca de Catalunya ms. 479); it is particularly interest-

ing because of the fragmentary notes in Catalan, in which the scriptural theme is set forth in threefold rhymed phrases. Another manuscript that of the Marseilles Public Library (n. 1095), contains an extensive collection of homilies from the beginning of the fifteenth century or earlier, in which scriptural material is interwoven with Apocryphal narratives.

The history of Bible translations and adaptations in eastern Spain is divided between Catalan and Valencian (not always neatly distinguished or distinguishable). Both domains are difficult to assess because of lack of editions (the project of an integral 1908 edition of the Catalan Bible planned by Foulché Delbosc was never realized, and parts of the vernacular Bibles in these domains have appeared piecemeal or in bibliophile items difficult to locate).

One distinguishing feature is the relation of Catalonia with its northern neighbor, evident in the *Compendi Historial de la Bíblia* (1361), and in the Catalan versions preserved as such. Alfonso II of Catalonia is said to have translated a Bible from the French in 1287. We are told that the Apocalypse found in at least ten Italian manuscripts was the link between the French Bible and Italian translations.

There is a family of Catalan Bibles, one complete in three volumes, known as the Peiresc manuscript of the Bibliothèque Nationale in Paris (BNP), ms. esp. 2–4, and two others of one volume each (most of the Old Testament), to be found in London, British Library, Egerton 1526, dated in the colophon 1465, and (Gen. 2.21-Psalms) in BNP ms. esp. 5, likewise dated 1461. Berger points to certain similarities between a New Testament of the fourteenth century known as the Marmoutier New Testament (BNP esp. 486) and the Peiresc Bible (ms. BNP 4), as well as with French texts (BNP fr. 899, and fr. 398, ms. Bibliothèque Mazarine 684) but with significant differences as to the underlying Vulgate text and extrabiblical elements. In the Peiresc MS Old Testament the glosses are also reminiscent of those that belonged to the French Bible 398 and were appended to Guyart de Moulins's great *Bible historiale*, containing a direct translation that was circulated widely in fourteenth-century France.

A translation of the Psalms attributed to the Dominican Romero de Sabrugera, now in the Seville rhymed Bible, is what seems left from a complete Catalan Bible that existed in the Escorial Library, other Catalan Psalters are found in BNP ms. fr. 2434, of the fourteenth century and BNP fr. 2433, of the fourteenth century.

A summary of the Bible and apocryphal Gospels, apparently of the fourteenth century, translated from Provençal, is known as *Genesi de scritura*. The *Biblia rimada* of the Biblioteca Colombina at Seville is like-

wise a versified summary of the Bible combined with apocryphal material.

A Catalan translation of the whole Bible into Valencian was made by Bonifatius Ferrer (d. 1417) and printed in 1477–1478. This edition, however, was destroyed so thoroughly that only the last leaf has been found and is preserved in a manuscript of the Carthusian Order, now at the Hispanic Society in New York. It is hard to say whether Bonifatius Ferrer leaned on some earlier version, and which of the other partial manuscript texts, especially of Psalms and Gospels, are related to his translation. Revealing for the history of the exposition of the Bible in medieval preaching are the many sermons delivered by Vincent Ferrer, an ardent advocate of the study of the Bible, who preached in Valencian (hence the Valencian quotations from Scripture with which he started his sermons).

Adaptations in the vernacular of biblical matter or of short biblical texts were also found in catechetical works, such as the *Biblia parva*, which tradition attributes to Peter Pascasius (thirteenth century), with quotations from the Old Testament woven into a rather disorganized assemblage of heterogeneous matter, likewise expounded in Valencian.

A place apart belongs to Catalan prayer books from Hebrew, and further illustrations of Catalan biblical matter from Hebrew could be collected from disputations between Christians (*cristianos nuevos*) and Jews, such as Petrus Alfonsi, *Dialogus ex Iudaeo Christiani et Moysi Iudaei* (Migne PL 157, 5535–5672), of which there is a fragmentary Catalan translation, and the *Disputa contra los jueus*. (Rome, 1907).

BIOGRAPHY

The commemoration of the lives of famous people, lay or ecclesiastical, draws on a millennial tradition. Medieval Spain, like the rest of Europe, took its inspiration from two sources, classical and patristic literature. The earliest manifestations, lives of saints, can be found in Hispano-Latin writers from St. Isidore onward. From the thirteenth century, the Latin tradition is joined by romance narratives, often derived from Latin sources, like Gonzalo de Berceo's rhymed lives of Riojan saints or the anonymous *Vida de Santa María Egipcíaca*. This vein continues in Castile through the

fourteenth and fifteenth centuries from the *Vida de San Ildefonso* by the “Beneficiado de Ubeda” to the lives of St. Isidore and St. Ildefonso copied by Alfonso Martínez de Toledo. On the secular side, the Suetonian pattern is evident in the thirteenth-century *Liber illustrium personarum* by Gil de Zamora and numerous sketches of famous individuals scattered through the Alfonsine *Estoria de España*. The most powerful inspiration, however, issues from the military epic and its heroes, enshrined in the *Carmen campidoctoris* and the *Historia Roderici*, eulogistic portraits of Ruy Díaz de Bivar. Later, the prose romance and the elaboration of the chivaleresque ethic, fused with treatises on government and ethics, prepares the ground for the flowering of the secular biographical genre in the fifteenth century, in both Latin and the vernacular, but mainly in the latter. The practice of implanting individual profiles in the official regnal chronicles continues from López de Ayala onward, but Pulgar, looking back from the end of the fifteenth century, does not consider the tradition to be very rich: “no los leemos esten didadamente en las corónicas como los fizieron, ni veo que ninguno los escribió aparte, como fizo Valerio e los otros.” Indeed, one must mention the impact of translations of the classics, like Plutarch, Caesar, Sallust, but above all Valerius Maximus, and other derivatives like Petrarch and Boccaccio anthologies of famous men and woman, together with contemporaneous humanist treatments of Alfonso V of Aragón by Beccadelli and Fazio.

In fifteenth-century Spain, there are over a half-dozen examples of varying extent and literary worth, all dealing with idealized concepts of man as knight, scholar, and priest, drawn from contemporary or near-contemporary history, either as single biographies or in collections of lives. The earliest, *El Victorial or La Crónica de don Pero Niño, conde de Buelna* (1379?–1458) is attributed to a Díez or Días de Games, *alférez* (lieutenant) to the count, and perhaps a royal scribe to Juan II of Castile. It deals with the education, career, and sentimental affairs of a wandering knight in Spain, France, the English Channel, and the Mediterranean. In contrast to this mélange of fantasy, legend, and diary jottings up to 1446, the *Crónica de don Miguel Lucas de Iranzo* records the deeds of the Constable of Castile during the dramatic years of the reign of Enrique IV. The chronicle stops short of his assassination in 1473. The narrative focuses on the daily patterns of life and the frontier exploits of a provincial noble by someone close to him, not clearly identified, but possibly Pedro de Escavias, *alcaide* of Andújar. The most compelling, most rhetorically elaborate account of a tragic life is the *Crónica de don Alvaro de Luna*, an earlier Constable of Castile (1388–1453), attributed to Gonzalo Chacón, *comendador* of Montiel,

himself a figure of weight in the court of the Catholic kings. It was probably written in two drafts, one near the date of his execution and another later in the century by someone who wished to create a figure of dramatic proportions, dedicated to the common weal, who was sacrificed to it in the end. Two other incomplete biographies of minor aristocrats are set in the latter years of the century and possibly written in the early sixteenth. Alonso Maldonado’s *Hechos de don Alonso de Monroy, clavero y maestro de la orden de Alcántara* is preserved as a prologue to a lost translation of Appian’s *Civil Wars*. It recounts another frontier life, laced with siege, robbery, and assault, up to 1475. The anonymous *Historia de don Rodrigo Ponce de León, marqués de Cadiz* terminates in 1488 and limits its account to the part played by the marquis in the Granada campaign. Only one autobiography in Castilian survives, the emotional memoirs of Leonor López de Córdoba, daughter of a supporter of Pedro I. Two collections of biographies or semblanzas cover the century; the *Generaciones y semblanzas* by Fernán Pérez de Guzmán embraces the first half and ends on a somber note of stoic resistance to fortune’s blows. The *Claros varones de Castilla* by Fernando del Pulgar takes in the next two generations and sets a similar selection of society in a more optimistic light, creating for Castile its own contemporary pantheon of heroes. The Crown of Aragón possesses some of the most remarkable monuments in this genre, particularly in the very personal chronicle of Jaime I (1213–1276), the *Libre dels feyts*, written in the first person with many epic resonances. Desclot structures his chronicle around the emergence of Pedro III (1276–1285), while that of Pedro IV the Ceremonious (1336–1387) is also autobiographical but much more refined and precisely organised. In fifteenth-century Catalonia there are two examples, in Latin, which illustrate the impact of humanism. Gonzalo García de Santa Maria’s official biography of Juan II of Aragón (r. 1458–1479) draws its inspiration from Sallust to illustrate the triumph of fortitude over adversity, set against the Catalan Civil War (1462–1472). Miquel Carbonell’s *De viris illustribus catalanis suae tempestatis libellus* concentrates on profiles of professional lawyers and notaries, taking as model Bartolommeo Fazio’s portrait of Alfonso V. Finally, as an example of the expatriate scholar employed in the royal court, there is Lucio Marineo’s *De Hispaniae viris illustribus*, included as book 5 of *De laudibus Hispaniae* (printed 1495?). This ranges from classical to modern times and touches on all ranks of society. Marineo also wrote a biography of Juan II of Aragón, deriving from Gonzalo’s, finished in 1508 and included in his *De rebus Hispaniae memorabilibus opus* (1530).

BLACK DEATH, THE

The Black Death, or bubonic plague, swept over most of western Europe during the two years between 1348 and 1350; it returned almost every generation afterward for the next two centuries. Although there is a consensus as to its course, there has long been a spirited debate among historians as to its long-term impact upon the economic, political, and social structures of medieval Europe. What was the overall impact of the plague? How lasting were its effects? How deeply did it transform medieval society? Although we have vivid firsthand accounts of the coming of the plague elsewhere and a plethora of documentary references to its onslaught for other parts of Europe, our knowledge of the nature and the impact of the plague in the Iberian Peninsula is negligible indeed.

Castile

We know that the plague killed Alfonso XI at the siege of Gibraltar in 1350, the only monarch to succumb to it in western Europe. There are also a few scattered references, in the ordinances of the *cortes* (parliament) and in the *Libro becerro de behetrías* to the *gran mortandad* (the large number of dead people), but beyond that, Castilian records are mute in their notice of the plague. We cannot really trace the course of the sickness through the peninsula, though common sense indicated that it must have spread from seaports and commercial thoroughfares into the interior—Gibraltar before Extremadura, the Crown of Aragón before Castile. We cannot pinpoint the first outbreak of the disease, nor can we date with any precise knowledge its ebbing away. Such questions as to how many people died and what percentage of the population the sickness vanquished remain more or less unanswered.

What is clear, however, is that the plague, coming as it did at the end of several decades of adverse weather, widespread nobiliary violence, and a high rate of inflation, had a catastrophic but short-term impact on Castilian society. The evidence is tangential but dramatic. For the ten to fifteen years after 1350, the

number of documents in municipal and ecclesiastical archives is reduced to a mere trickle. Although there has been a decline in the number of royal charters, records of land and real estate transactions, donations and other such documents from the 1330s on, the drop in the number of such sources after 1350 is dramatic indeed, almost as if life had come suddenly to a full stop. Rents collected from mills and farms fell, in some cases, by half or as much as two-thirds. Such was the case in Burgos in 1350, when the cathedral chapter reduced its rental prices for mills by more than a half and still had difficulties finding tenants.

In 1351, the cortes of Castile enacted a statute of laborers. It was a response, as it was in England, to the scarcity of labor and the rapid increase in wages, signaling the desire of those in power to control the supply and cost of labor. Finally, the *Libro becerro de behetrías* (compiled in 1351–1352) reported that because of “the great death brought by the plague” one-fourth of the villages listed in the census (more than 2,000 altogether) were deserted. Although the collapse of northern Castilian rural life had begun much earlier than 1350, the plague must have accelerated this process.

We have further evidence for the psychological and spiritual impact of the plague in the somber and melancholy literature of the period. Rabbi Santob’s *Proverbios morales* and the Castilian version of the “Dance of Death” bring us close to the pessimistic character of the age. At the same time, the Jews, who had enjoyed a fairly peaceful and prosperous existence in Castile throughout most of the thirteenth and early fourteenth centuries, became, once again, the targets for popular violence.

The Crown of Aragón

The history of the Black Death and of its impact on the lands of the Crown of Aragón is better known than for Castile. A number of local histories, as for example, that of Girona, allows for some estimates of the plague’s effects. Overall mortality has been calculated to range between 25 to 35 percent, but in some areas, such as the Plain of Vic, as much as two-thirds of the population may have died from the pestilence. Other areas in Catalonia suffered mortality rates of 50 percent of the entire population. Recovery, as was the case throughout the west, was hampered by recurrent epidemics throughout the next two centuries. Most historians agree that the plague was the main cause of the Crown of Aragón’s late medieval crisis. It sharply reduced the realm’s demographic base and hurled it—above all the county of Barcelona—into an economic, social, and political crisis from which the east-

ern kingdoms would not fully recover for two hundred years.

While there are few objections to this assessment, its general conclusions do not apply to Castile. In the latter, the late medieval crisis had its origins in an earlier period and was the result of structural economic and political problems. There, the Black Death, for all of its impact, just added to serious problems that were already a century old. Castile, mostly through the beginnings of wool exports and of its political restructuring, recovered enough to claim hegemony in the peninsula within a short decades after 1350.

BLANCHE OF CASTILE

Blanche of Castile (1188–1252: queen of France, 1223–1226), daughter of Alfonso VIII of Castile (1158–1214) and Leonor of England, was regent and chief adviser to Louis IX of France. In 1200, as part of a treaty between her uncle, King John of England, and King Philip Augustus of France, John's mother Eleanor of Aquitaine selected Blanche to marry Philip's heir, the future Louis VIII (1223–1226). Upon her husband's death, Blanche became regent for her minor son, Louis IX (1226–1270) under the terms of Louis VIII's will. As regent, Blanche sought to preserve the integrity of France by subduing baronial revolts and preventing English intervention in Normandy. Her actions strengthened the French monarchy. Throughout her life she exercised considerable influence over her son, even, according to Joinville, in his relations with his wife, Margaret of Provence. Against her wishes, Louis went on crusade (1248–1254), but he chose her as his regent. During his absence she successfully completed his program of administrative reform, raised money for his crusade, and dealt with the revolt of the Pastoureaux. Blanche died in November 1252 while Louis was still away, and a council of bishops assumed the regency. Blanche's instructions to Louis IX on piety are recorded in Joinville. Her daughter, Isabelle, chose a religious life in preference to a dynastic marriage arranged by Blanche and Frederick II. Her three other children were Robert of Artois, Alphonse of Poitiers, and Charles of Anjou.

BLANCA, QUEEN OF NAVARRE, WIFE OF ENRIQUE IV

Daughter of the Infante Juan of Castile (who was the son of Fernando of Antequera and played such a prominent role in the history of the Iberian kingdoms, becoming king of Navarre in 1425 and then king of the Crown of Aragón in 1458), the unfortunate Blanca consistently fell victim to the vagaries of political and dynastic intrigues.

Born in 1424, her first marriage to the Infante Enrique of Castile (the future Enrique IV) was arranged as a consequence of the peace treaty of Toledo of 1436 between Castile and Aragón-Navarre, the betrothal conditions being drawn up early in 1437, and the marriage taking place in Valladolid in 1440 to the accompaniment of dazzling fiestas and elaborate *entremeses*, *juegos*, and *alegrías*.

The marriage, however, produced no children and was dissolved in 1453, the extraordinary reasons being set out in a lengthy canonical *sentencia*, or decision, delivered in a case presided over by the bishop of Segovia, Luis Vázquez de Acuña. According to this, the prince had never succeeded in having sexual intercourse with his wife, despite strenuous efforts, and two respectable and experienced women, probably midwives, testified that their physical examination of Blanca revealed that she was still a virgin. In addition, however, detailed evidence was accepted from certain women from Segovia that was designed to demonstrate beyond doubt that the prince frequently enjoyed perfectly normal sexual relations with them, evidence that of course was presented in order to provide conclusive proof of Enrique's virility. The essential point here is that all these salacious details made it possible for the case to be solemnly resolved on the grounds of an impotence that was specific rather than general, an impotence that applied only to Enrique's relationship with Blanca and that left both parties free to marry again after the annulment.

Yet such an extraordinary explanation amounted to a case of *maleficium*, with the clear implication that Blanca was the guilty party, and in addition she was obliged to leave Castile and return to Navarre. Her

return posed fresh problems. Although her brother, Charles, prince of Viana, attempted to establish her rights as heiress to the throne, their father, Juan II of Aragón, retained effective control of Navarre. Indeed, Blanca never enjoyed any real freedom after her return. Charles of Viana died in 1461. Blanca, who had been kept virtually imprisoned in the castle of Olite, was subsequently handed over to the counts of Foix, the aim of Juan II almost certainly being to prevent her from marrying again, and thus vesting the right of succession in her sister, Leonor, Countess of Foix. Blanca died, allegedly of poison, in the castle at Orthez in 1464. Ironically, two years earlier she had relinquished her rights to the succession of Navarre to her ex-husband, Enrique IV. By this time, and equally ironically, rumors were already circulating at the Castilian court about both the latter's alleged homosexuality and his sexual impotence. The right of succession to Navarre passed to Blanca's sister, Leonor.

BLANCHE OF FRANCE

Blanche of France (1252–1320), daughter of Louis IX and Margaret of Provence, was wife to Fernando de la Cerda. Louis IX and Alfonso X of Castile (1252–1284) negotiated the marriage between Blanche and Fernando, Alfonso X's heir, when Blanche was fourteen and Fernando was eleven. According to the terms of the agreement, Blanche received a yearly income of 20,000 *maravedís*, a dowry of 10,000 *livres*, and retained the right to return to France and keep her income if her husband predeceased her. The wedding was celebrated in Burgos when Fernando came of age in 1269. The marriage ensured peace among Castile, France, and Navarre, although the display of the wedding feast and the guest list reflected Alfonso's European ambitions; later the Castilian nobles protested the sum that Alfonso spent on the celebrations. Blanche bore two sons, Alfonso and Fernando, later known as the Infantes de la Cerda. When Fernando de la Cerda predeceased his father in 1275, his younger brother Sancho was acknowledged as heir by the *cortes* (parliament) in 1276; the infantes were thus disinherited. Blanche's marriage contract left no provisions for her possible widowhood with disinherited minor children. The ensuing rupture with France reflected both concern over

the payment of Blanche's Castilian income and the rights of the infantes to the throne. After the decision of the cortes, Blanche and her mother-in-law Queen Violante removed the infantes from Castile to Aragón. There they stayed in confinement while Blanche traveled to France and to Portugal, seeking supporters for her sons' rights. In France her brother, Philippe III, assumed the cause of the infantes to ensure his sister's income. Blanche sent representatives to Bayonne in 1290 where Philippe IV of France and Sancho IV of Castile (r. 1284–1295) decided her pension and possessions. She entered the Franciscan convent of Saint-Marcel of Paris, where she died 17 June 1320.

BONIFAZ, RAMÓN

Of Italian or French descent, Ramón Bonifaz was one of those *francos* (people from beyond the Pyrenees) who settled in towns along the road to Compostela; in this particular case, the town was Burgos in the early thirteenth century. His fortune, derived mostly from mercantile activities, must have been substantial. In 1227, together with his cousin Arnalt Almarich, Bonifaz purchased a house in the neighborhood of Sanct Llorente, Burgos, for the unprecedented sum of 5,000 *maravedís*. He served as *alcalde* (mayor) of Burgos throughout most of the first half of the century, and in 1247 Fernando III, king of Castile and León, ordered Bonifaz to organize a fleet, drawn mostly from the Bay of Biscay ports, and to join the royal armies besieging Seville. Bonifaz's fleet, a motley combination of Cantabrian *naos* and *holops*, as well as some Mediterranean galleys, played a major role in the final capture of Seville in 1248, after breaking through a barge barricading the Guadalquivir River.

Although Burgalese historians have promoted Bonifaz as the first admiral of Castile, there is no convincing evidence that he ever held such title or that the fleet he gathered remained as a unit much longer beyond the Sevillian campaign. He was well rewarded

by the king in the *repartimiento* of Seville and named a royal official in 1252.

Bonifaz's descendants dominated the social, economic, political and ecclesiastical life of Burgos for the next century and a half, holding important benefits (including the deanship of the cathedral chapter of Burgos) and municipal and royal positions. They also invested heavily in the land and real estate market in and around Burgos, a policy already initiated by the elderly Bonifaz.

BOOKS AND BOOKMAKING

The codicology of medieval Spanish books is still in its infancy. While there are good general studies available on the history of decorative bookbinding and manuscript illumination in Spain, monographic treatment of the archeology of the book is still wanting, and the difficulty results from many factors. Exemplars prior to the tenth and eleventh centuries are scarce, and many books were carelessly rebound in later centuries, including our own. Many fine examples of Spanish craft bindings were executed by and for Muslims and Jews whose works were destroyed by Islamic and Christian censors; our best information on practices among these Iberian connoisseurs of the book comes from witnesses elsewhere throughout the medieval Islamic (Tunisian, Moroccan) and Jewish worlds. As early as 531, prestigious Christian books were ravaged for their covers decorated with jewels, metalwork, and carved ivory or suppressed because of their contentious theological or liturgical content. Finally, the examination of the design, structures, and supports of books as integrated physical objects has commonly been subordinated to an interest in their decoration, whether on the illuminated page or on their tooled leather surfaces.

In terms of writing supports, Hispano-Romans probably employed the same materials as in the rest of Romania—namely, sheets of lead, papyrus, split wood, and wax tablets (still in use during the life of Gonzalo de Berceo). The long distance from Egypt and the disruption of sea lanes made the importation of papyrus to Iberia unreliable. Isidore of Seville records the availability of parchment from animal skins, and the same support later supplied the needs of the legendary libraries of the caliphate of Córdoba, which

were reputed to boast 400,000 volumes. The adoption of parchment and the definitive adoption of the codex form date from the early Visigothic period. The classic Spanish codex, with gatherings of inscribed bifoliate leaves sewn across cords or parchment straps that were then attached to wood boards and covered with leather (sometimes with a Moorish-style flap that wraps around over the front cover), endured through the transition from parchment to paper and only saw serious modification with the advent of printing, when the leather-clad boards were replaced with cheaper limp covers.

Paper was introduced into al-Andalus by Islamic craftsmen in the twelfth century and grew into a highly advanced industry. Spanish paper, counted among the most prized in the Islamic world, was exported to sites as far away as Damascus and presumes a large number of local paper mills, mostly in the eastern half of the Iberian Peninsula but with several in the Guadalquivir valley below Córdoba. The most famous site of Moorish paper manufacture was in Játiva (Valencia), gradually incorporated into the kingdom of Aragón after 1244 by Jaime I, who inflated and nearly ruined the industry by optioning the entire output of its mills to stoke his paper-based bureaucracy, the first in Europe. Alfonso X included cautionary restrictions on the use of paper in the *Siete Partidas*, (Partida III.28.5), perhaps based on lingering prejudices against this Moorish artifact but also due to its still limited market as a taxable commodity within and beyond Iberia. The existence of a lively local trade in paper in southern Spain already in the mid-thirteenth century is suggested by the reams of blank script for sale in the miniature accompanying *cantiga* 173 in the *códice rico* (Escorial T.I.1). Paper established itself as the dominant book support in Spain by the early fourteenth century.

As elsewhere in premodern Europe, the production of books in Spain was a principally monastic affair until the start of the thirteenth century. Medieval Spanish universities, usually under royal rather than ecclesiastical patronage, never succeeded in sustaining a commercial infrastructure of parchmenters, stationers, book manufacturers, copyists, illuminators, and binders, as happened in Oxford and Paris. Interestingly, however, the visionary Alfonso X codified rules (Partida II.31.11) for maintaining stationers and certifying the reliability of the textbook chapters they rented out to students at the newly chartered universities in Salamanca (1254) and elsewhere. These rules antedate evidence of similar arrangements in Paris (1275) by a quarter of a century. Alfonso X can be credited with being the first true bibliophile of Spain—both commissioned books and treasured them as aesthetic objects—but noble patronage of the book arts did not

flower as a by-product of class until the fifteenth century.

Romanesque and Gothic bookbindings manufactured in Spain, especially in the northeast, are much like their counterparts elsewhere in medieval Europe. One distinctively Spanish style of blind tooling on leather covers is commonly dubbed *hispano-árabe* or *mudéjar*, in not a few cases the creations of named Jewish and Moorish artisans working in the traditions of figured Cordovan goat skin. *Mudéjar* here refers to the fusion of Islamic decoration—precise interwoven plaitwork within sometimes complex geometric frames creating an interplay between areas of light and shadow—combined with the serial die stamping of transpyrenean decorative styles including straight lines and hatchwork with stamped rows of small figures of animals and other heraldic devices. Subsequent fifteenth-century styles incorporate effects of raised (*repujado*) covers with larger devices, in leather or applied metal work, sometimes set against or above rich cloth surfaces. Surviving bindings of this latter type include those made for the Marqués de Santillana and Queen Isabel I the Catholic, two of the earliest secular patrons of the book arts whose bindings survive in sufficient numbers for study. Toward the end of the fifteenth century, Flemish bindings (and the plastic arts in general) grew in influence in Spain, and a certain Antonio de Gavere of Bruges was court binder to Felipe el Hermoso. Full-cover stamping plates, decorating with patterning wheels, and mosaics of colored leather patches are all postmedieval phenomena, but tooling in gold leaf, a clearly Renaissance innovation in the rest of Europe, was already practiced by Muslim artisans in Spain in the thirteenth century and apparently spread, along with *mudéjar* decorative motifs, to the rest of the continent during Aragón's possession of Naples in the mid-fifteenth century.

New areas of study that focus on the medieval book in Spain are emerging in recent decades. There is fresh interest in the book as a symbolic object representing and bearing power within medieval society, and also as a nexus for the negotiation of meaning between writers and readers. The physical constraints of the medium enlighten studies of how books circulated and were reproduced, and also how they were used and shared by their consumers. The written page, with or without other decoration, is increasingly seen as an aesthetic unit worthy of examination, especially as it modulates the message of the text presented on it. The study of the evolution of the formal elements of Spanish books as cultural artifacts is also gaining greater regard as scholars explore their ties to the burgeoning market economy, the expansion of literacy, the diffusion of intellectual trends, the growth of pri-

vate collections, the privatization of intellectual pursuits, and the interiorization of devotional practices.

BOURGEOISIE

The development of the bourgeoisie in medieval Castile is closely related to the renewal of urban life in the region. The growth of towns in northern Castile, the conquest of great Muslim urban centers (Toledo, Córdoba, and Seville), and the foundation of new cities along conflicting frontiers led to the emergence of distinct patterns of economic development and social organization. If by *bourgeoisie* in the medieval context one understands as those urban middling groups who stood outside the so-called feudal relations and who, moreover, did not obtain their income from the land but from artisanal crafts, commerce, and financial transactions, then there was no bourgeoisie in Castile. It is doubtful that there were well-defined feudal ties between lords and vassals in the region, or, at least, in the manner in which those ties existed in France and England. There were a few cities and small towns in which the middling urban groups derived most of their income from long distance trade—Burgos, some of the ports on the Bay of Biscay (Bilbao, San Sebastián, etc.)—but even in such places, there is ample evidence that the bourgeoisie invested heavily in land and often lived a good part of the year in their rural estates. What types of social grouping, of social and economic organization can be thus described for medieval Castile?

The Revival of Urban Life

Most of the towns in the ancient kingdom of Asturias and later in its successor, the kingdom of León,

were mere administrative centers or ecclesiastical sees. Urban centers such as Cangas de Onís and even León in the period between the early eighth century and the beginning of the eleventh barely generated enough trade and artisanal activity to bring about the development of a fully formed bourgeoisie. North of the Duero River, in the area that in the eleventh century became the kingdom of Castile, the rise of the bourgeoisie was directly related to the popularity of the pilgrimage to Compostela. The large number of pilgrims who poured into the peninsula on the way to Compostela led to the emergence of towns and cities, convenient rest stops, along the road. Francos, people from beyond the Pyrenees, settled in Logroño, Vitoria, Burgos, Sahagún, and even in towns off the main pilgrimage route, such as Santo Domingo de Silos. Merchants and artisans, these francos formed the core of an incipient bourgeoisie. They settled in the towns, and in less than a century they and their descendants married locally and set roots in their adopted cities. Together with a socially mobile local population, these groups, a mixture of foreign, foreign descendants, and native formed the bourgeoisie of northern Castile. Their ties with northern markets, above all with the textile centers of Flanders and northern Europe, gave them an advantage in the commercial competition that marked the opening of Castile and of Iberia to Cluniac and European-wide influence in the eleventh and twelfth centuries.

In many respects, the bourgeoisie of specific towns along the Road to Compostela behaved along patterns similar to those of their northern counterparts. In the twelfth century, these bourgeois groups challenged, in Sahagún, Compostela, and other towns, the authority of their ecclesiastical or lay lords. This period of bourgeois rebellions led, in spite of seignorial victories, to the political and social rise of bourgeois groups in most northern Castilian cities. Unlike their northern counterparts, the Castilian bourgeoisie played a significant military role from the very beginnings of its existence. Their wealth allowed them to serve on horseback, and this provided them with a clear superiority—military, social, economic, and political—against other social groups within the city. It also made the city militia an important component of the expansionist policies of the Iberian kings, as well as a formidable ally in the perennial struggle of the crown against nobiliary ambitions.

The Castilian Bourgeoisie South of the Duero River

The patterns of reconquest and settlement south of the Duero and the economic structure of the towns founded or resettled in the region dictated the emer-

gence of urban groups quite distinct from those along the road to Compostela. Urban centers such as Avila, Segovia, Cuéllar, and Sepúlveda developed a bourgeoisie that did not have the commercial orientation of the bourgeoisie along the road to Compostela. In the Duero basin, the ruling urban groups derived their income mostly from ranching and land rents. Artisanal and mercantile activities (mostly of a local nature) were often in the hands of Jews, Muslims, or foreigners. Patterns of inhabitation also indicate a flow from city to countryside and vice versa. Prominent members of the bourgeoisie maintained country estates and farms in the towns' hinterlands. This was a pattern also present in the more commercially oriented cities of the north, but not to the extent to which it existed in places such as Avila. There, for example, the life of the bourgeoisie was decisively tied to the land. In very general terms, one can argue that the process of aristocratization of the bourgeoisie, a phenomenon that took place throughout Castile, was far more rapid and effective in those places without a strong mercantile orientation.

Urban Centers in Andalucía

The conquests of Córdoba (1236), Seville (1248), and other Andalusian cities marked the emergence of yet another stage in the development of the Castilian bourgeoisie. The original Muslim inhabitants were expelled from cities throughout Andalucía and repopulated with Christian inhabitants, mostly from the armies that had helped conquer the land. Foreigners, most notably Genoese and other Italians in Seville, soon came to dominate long distance trade and to profit, after the opening of the Strait of Gibraltar to Christian sailing, from the maritime linking of the Mediterranean and North Atlantic markets. Jews also played a significant role in the commercial life of the south and, after the massive conversions of 1391, *conversos* became an important and numerous component of Andalusian bourgeoisies. This was certainly the case at Seville, Jaén, and other towns in the region.

Economy, Society, and Culture

As indicated above, the Castilian bourgeoisie was engaged in a variety of economic pursuits and derived its income from different sources. The top echelon of the bourgeoisie of Burgos, probably the most dynamic and outward looking in northern Castile, gained its prominence from long distance trade. This meant, above all, the import of woolens and luxury textiles from Flanders and other manufacturing centers in northern Europe. It also exported horses, iron, hides, agricultural products, and, after 1350, immense

amounts of wool. These bourgeois groups also benefited from the distribution of imported goods through the realm. Elsewhere in Castile, bourgeois elites gained their living from local trade, or more likely from rents and from ranching. In the south, patterns of trade and agricultural production were different. Seville drew into its orbit both Atlantic and Mediterranean products and exported olive oil and wine to local and foreign markets. Yet, regardless of location or of economic structure, the Castilian bourgeoisie uniformly invested its profits in land. Whether at Burgos, Avila, or Seville, the bourgeoisie entered the market for land with a vengeance and, from the early thirteenth century on, built substantial landed estates. This seigniorialization of the Castilian bourgeoisie represented an important stage in its development. Historians have argued for the structural weakness of the Castilian bourgeoisie and have held this responsible for the economic shortcomings of early modern Spain. This is accurate only in a very limited sense. In truth, because the import of luxury textiles from abroad and the export of wool proved to be so profitable for Castilian merchants and for the crown, there never was any serious or sustained effort to create a manufacturing economy. On the other hand, in its own terms, the Castilian bourgeoisie was extremely successful. By the mid-fourteenth century, it had moved boldly into the ranks of the lower nobility or enjoyed, through its military service, privileges usually reserved for the nobility elsewhere. It played an important role in the political life of the realm through its participation in the *cortes* and *hermandades* and through the monopoly, with the king's support, of municipal government. By the fifteenth century, the Castilian bourgeoisie (by this time most of them conversos) provided the bulk of the *letrado* (learned) group. Thus, they formed the core of royal administration and spearheaded the reception of the Renaissance in Castile.

Similarly, regardless of its economic orientation, the upper levels of the bourgeoisie, what one may describe as a patrician elite, also monopolized the most important urban ecclesiastical benefices. From the mid-thirteenth century on, important canonships, deanships, and even bishoprics were held by members of the bourgeoisie. This signaled an important transformation in the life of the church, for it meant the partial privatization of ecclesiastical resources. It also provided bourgeois groups with additional sources of income and social mobility.

Socially, the bourgeoisie established its distinctiveness from other social groups by the creation of exclusive brotherhoods and fraternities. Open only to members of the upper bourgeois groups, these religious and social organizations also brought together

those sharing equal economic interests. Above all, these brotherhoods or fraternities reaffirmed social, economic, and political hierarchies and fostered the hegemonic policies of the bourgeoisie toward other social groups within their respective cities. How successful they were in establishing their control is clearly attested in the absence in Castile of any serious challenge to bourgeois control by less privileged urban groups. Although there are numerous reports of urban unrest throughout Castile, they never erupted into full-scale class conflicts, as they did elsewhere in the west. Moreover, the linking of patrician elites with important nobiliary houses through marriage and business also furthered the social, economic, and political hegemony of the Castilian patriciate.

BRAGA

The archbishopric of Braga is one of the oldest centers of Christianity in the Iberian Peninsula. Under the rule of the Suevi in the sixth century, Galicia had embraced Arianism, but the arrival of Martin to its shores around 550 changed the entire situation. Martin, a monk and one of the most distinguished theologians of his time, became the abbot of Dume and a bishop in 556. He took part in the first council of Braga in 561 and later became an archbishop, presiding at the second council of Braga in 572. From that year onward, his name appears in all records as Martin of Braga. He converted the Suevi kings to Christianity and worked hard to eradicate pagan practices, which were common among the peasants.

The church of Braga went through a very difficult period at the time of the Muslim domination. The bishop of Braga had to live for centuries in Asturias. Following the conquest of the city by Fernando the Great, the cathedral was restored in 1070. In 1121 Pope Calixtus II transferred the rights of the church of Mérida, which was under Muslim jurisdiction, to the cathedral of Compostela. But the archbishop of Compostela claimed also as its suffragan dioceses Lamego, Viseu, Guarda, Coimbra, Bisboa, and Evora. The archbishops of Braga and the kings of Portugal never accepted this claim and raised all sorts of obstacles to the prelates

who wanted to fulfil their duties, sustaining the primacy of Braga in the peninsula. Braga had as its suffragan dioceses Oporto, Viseu, and Coimbra in Portugal, as well as Mondoñedo, Lugo, Orense, Tûy, and Astorga in Castilian territory. Castilian intervention in Portuguese affairs between 1383 and 1385, followed by the war that gave Portugal its independence, led Boniface IX in his bull *In eminentissimae dignitatis* of 10 November 1393 to bring ecclesiastical frontiers in line with national boundaries.

In the fifteenth century the church had to face a serious conflict with the crown. Fernando da Guerra (1387–1467), archbishop of Braga (1417–1467), was a strenuous upholder of the rights and privileges of the church. He reorganized the economy of the dioceses and fought vigorously the violences of the nobility against the church. On 10 January 1437, he recovered from King Duarte all the rights and privileges he had lost. Fernando da Guerra was the great-grandson of Pedro I and a nephew of João I.

BRAGANZA, HOUSE OF

Founded in Portugal in the fifteenth century, the house of Braganza was established with the first duke of the same title, Dom Afonso (1377–1461). He was the illegitimate son of Dom João, Master of Avis, later João I, and Inês Pires. This relationship was dissolved before João I married Philippa of Lancaster, who welcomed Afonso at the court. On 1 November 1401 Afonso married Beatriz, the daughter of Nun'Alvares Pereira and Leonor Alvim. Nun'Alvares was the wealthiest nobleman of the realm and, as he had no other offspring, he made large donations of land and castles to Beatriz on her wedding. On the other hand, João I provided Afonso with more land and made him the count of Barcelos (1401). This property was further increased when Beatriz gave birth to Afonso (1402–1460), Fernando (1403–1478), and Isabel (1404–1465). Nun'Alvares granted Fernando large estates in the south and made him the count of Arraiolos. Through marriage alliances the family gained great power in the country. In 1424 Isabel married her uncle João (1400–1442), the son of João I, thus strengthening the family ties with the crown. Her father Afonso was granted the title of first duke of Braganza in 1442 by the regent Dom Pedro on behalf of Afonso V. The

vast estates owned by Afonso were secured in perpetuity in 1433 by King Duarte.

The first duke was an ambitious man and sought to increase his power and wealth even further. He opposed the policy of centralization pursued by the regent Pedro since 1443 and persuaded Afonso V to turn against him. His machinations led to a military confrontation between Afonso V and Pedro, who was killed in the Battle of Alfarrobeira (1449). The duke of Braganza gained materially from Pedro's defeat, being the undisputed leader of the interests of the high aristocracy. The duke's son, Fernando, became the second duke of Braganza, as his brother Afonso, count of Ourem, died one year before his father. Fernando had fought in Tangier and was appointed governor of Ceuta in 1445. He had tried unsuccessfully to dissuade his father and his brother from plotting the downfall of Pedro. In 1429 he married Joana de Castro, daughter of Dom João de Castro and Dona Leonor da Cunha. His son, Fernando II (1430–1483), became the third duke of Braganza (1475) and second duke of Guimarães. He married Isabel, daughter of Fernando, the son of Duarte I, and Beatriz, daughter of João, the fourth son of João I. Fernando, the third duke of Braganza, incurred the wrath of João II when he opposed the king in his struggle to curb the power of the great houses.

Fernando was tried for treason and executed in Evora in 1483. All his titles and estates were forfeited by the crown. These were restored by Manuel I (1469–1521) in his royal charter of 18 June 1496. Dom Jaime (1479–1532), Fernando's son, the fourth duke, returned to Portugal from Madrid in 1496.

BRAULIO

Braulio came from a family deeply entrenched in the church in the northeast of the Iberian Peninsula. His father Gregorio was a bishop, probably of Osma, and one of his brothers, Fronimian, was abbot of the monastery founded on the site of the hermitage of St. Aemilian in the Rioja (later San Millan de la Cogolla), at least one of his sisters was an abbess. His other brother Juan held the bishopric of Zaragoza, to which Braulio succeeded on the latter's death in 631. Prior to this, Braulio had spent some time in Seville, where he studied with Isidore before returning to become Archdeacon of Zaragoza under John. For his brother

Fronimian he wrote a *Life of St. Aemilian* (ca. 636), and he drew up a list of the works of Isidore which that has been used to establish the authenticity and possible chronology of several of them. He carried out an editorial revision of Isidore's *Etymologiae* after the latter's death, and the present structuring of the work is probably that imposed by Braulio. His own most substantial literary inheritance is a corpus of forty-four letters, addressed to a wide variety of lay and clerical correspondents. These are among the most stylish literary products of the Visigothic period. After Isidore's death he seems to have been regarded as the foremost intellectual figure in the Visigothic Church, and he was entrusted by the bishops assembled at the Sixth Council of Toledo in 638 with the task of replying on their behalf to various criticisms that Pope Honorius I (papacy 625–638) had made of their failure to take sterner measures against the Jews.

One of Braulio's closest friends and disciples, Eugenius, who had previously been archdeacon of Zaragoza, became metropolitan bishop of Toledo in 636. By the time of Braulio's death in 651, intellectual leadership of the Spanish church had passed firmly into the hands of Toledo.

BREVIARY OF ALARIC

The Breviary of Alaric, also known as the *Lex Romana Visigothorum*, or "Roman Law of the Visigoths," was issued by the Visigothic king Alaric II (484–507) in the year 506. It consists of an abridged text of the Theodosian Code, to most of the laws of which are added what are called "interpretations." These are statements modifying the meaning or application of the law to which they are appended. Such a procedure for adapting Roman imperial law to local conditions had been employed by the Praetorian prefects of the Late Roman Empire, and Alaric and his advisers were thus following an established precedent. It is often thought that Alaric's Breviary was intended to apply only to his Roman subjects, while his Visigothic followers would be judged by the laws contained in the code of his father, King Euric (r. 466–484). This is probably mistaken, and both codes, which are neither mutually contradictory nor overlapping in their contents, should be seen as applying to all those subject to the Visigothic monarchs. The *Forum iudicum*, or *Lex Visigothorum*, the code of law issued by Rec-

cesvinth in 654, replaced all previous laws of the Visigothic kingdom, and thus put an end to the use of the Breviary.

BUREAUCRACY See ADMINISTRATION, CENTRAL

BURGOS, CITY OF

The medieval history of the city of Burgos is closely related to Castilian history, producing between the ninth and fifteenth centuries a perfect transition between the region's stages as a *condado* (territory ruled by a count) and as a kingdom. Christian repopulation in the time of Alfonso reached the banks of the Arlanzón River and resulted in the construction of a fortress around which several towns (*burgos*) were established. Diego Rodríguez Porcelos is commonly believed to have founded the city in 884. In the tenth century, Fernán González helped bring about the unification of Castile, and the existence of a primitive city wall is mentioned, which, along with the castle, would have been characteristic features of the city. The population would have been concentrated in the regions closest to the sides of the hill, and neighborhoods were organized around the churches—San Lorenzo, San Esteban—which played an important role in the configuration of the city.

The city's importance as headquarters of the Castilian monarchs brought the nobility's presence to Burgos. Other important moments in the evolution of the city were the relocation of the episcopal see of Oca to Burgos, and the construction of the Church of Santa María in the lower section of the city, which was built on land donated by Alfonso VI for a Romanesque cathedral. At the end of the eleventh century, San Lesmes created the Monasterio de San Juan outside the city walls. The building included a hospital, which became important due to the city's location on the route of Santiago. In the twelfth century the population in the lower river regions (la Llana) increased, and in 1187 Alfonso VIII established the Monasterio de las Huelgas, the Royal Pantheon, and the Hospital del Rey. The city also began to acquire an elongated shape stretching from east to west. The Jewish and Moorish quarters were located in the northwestern end of the city. These groups were important components of the population and participated actively in the city's economic activ-

ity, which was dominated by agriculture and craftsmanship. Beginning in the thirteenth century, Burgos (especially la Llana) was the commercial hub of northern Castile. The city's international economic activity was in the hands of a few families that acquired great wealth, power, and prestige, marking Burgos with a brief moment of glory in the fifteenth century.

The thirteenth-century construction of the Gothic cathedral (under the initiative of Bishop Mauritius and King Fernando III) was a decisive element of the city's urban configuration. Along with the parochial churches and the monasteries, which experienced a time of splendor at the end of the Middle Ages when the city reached its highest glory under the Catholic Monarchs, the cathedral was the most important religious center in Burgos. Other notable buildings are the palace known as "Casa del Cordón" and the Carthusian monastery of Miraflores, whose church contains extraordinary works of art, including the magnificent altarpiece and the tombs of Juan II and his wife Isabel.

BURGOS, SOCIO-ECONOMIC HISTORY OF

Located on the banks of the Arlanzón River, on a strategic hill dominating ancient roads, the city of Burgos was founded in the early 880s (either 882 or 884) by Count Diego Porcelos, one of the rulers of the fledgling county of Castile. First as a strong place, a castle on the moving frontier with Islam in the ninth and tenth centuries, later as the see for the peripatetic diocese of Valpuesta-Oca, Gamonal, in the 1080s, the city became a bustling commercial center by the eleventh century and remained the most important distribution center for international and regional trade in northern Castile until the early modern period.

To a large extent, the development of commerce and of a bourgeoisie in the city was influenced by the pilgrimage to Compostela. Burgos, as one of the main stops on the road, it benefited from the pilgrimage trade and from the settlement within its walls of numerous foreign merchants, the *francos* of early castilian *fueros* (municipal charters). The city also became a favorite residence of the Castilian kings, a preferred site for the meetings of the *cortes* (parliament), the location of the royal chancery, and unofficial capital of the realm—or as its shield proudly proclaimed, *caput Castellae*.

Throughout the twelfth century, foreign and native merchant families intermarried, and at the onset of the thirteenth century, these mercantile groups became a well-entrenched and powerful oligarchical elite. Deriving their income from long-distance trade—mostly the import of woolen cloth from Flanders—these merchants began to monopolize municipal offices and, by the thirteenth century, held tight control of the municipal council. The complex process by which a small group came to dominate the economic, social, and political life of Burgos and other Castilian cities is also directly related to the tax exemption granted by Alfonso X to the non-noble knights of Burgos and other cities after 1256.

Organized as a mounted militia, exempted from most taxes, enjoying a secure financial base and an almost complete monopoly of municipal and royal offices in Burgos, a few family groups, most notable the Sarracín and the Bonifaz, also invested heavily in the Burgalese hinterland, building sizable rural estates and binding the countryside to the city. In addition, they founded and/or joined exclusive brotherhoods and monopolized ecclesiastical benefices, turning Church income to their own benefit.

Institutionally, Burgos, a royal city, participated actively in the *hermandades* or leagues of cities organized in 1296 and 1315 to protect the crown from rapacious regents and unruly nobles. Its aspirations to autonomy, however, were short-lived indeed. By 1345, the imposition of the regimiento in Burgos and other Castilian cities, with the approval of the ruling oligarchy, signaled the beginning of direct royal control over municipal affairs.

Burgos's heyday, however, still lay in the future. After the upheavals of the mid-fourteenth century, the rise of the wool trade made the city the center for the profitable export of wool. The *consulado* of Burgos was the expression of this new commercial power, and by the late fifteenth and early sixteenth centuries Burgalese merchants appeared prominently in Flemish cities. Yet the long trend that moved the center of Iberian life southward and outward, the rise of Madrid as the capital of the kingdoms, and the economic disasters of the early modern period brought about the city's inexorable downfall.

BURGUNDY, HOUSE OF

The ducal and comital houses of Burgundy were two of the greatest lineages of the French kingdom, and both were much involved in the affairs of León-Castile in the eleventh and twelfth centuries. Duke Robert the

Old (r. 1032–1037) was the younger son of King Robert the Pious (996–1034) and the father of Constance, who became the second wife and queen of Alfonso VI of León-Castile (1065–1109) between 1079 and 1093. She thus became the mother of his future successor,

Queen Urraca (1109–1126) but did not provide him with any other progeny who survived. One uncle of Constance was the great Abbot Hugh of Cluny (1049–1109), under whom that house came to receive an annual subsidy from Fernando I of León-Castile

(1037–1065), which was doubled by Alfonso VI in 1090. Both the latter and his daughter and successor also granted a number of monasteries in the realm to Cluny, which became the substance of a new Iberian province of the growing Benedictine order.

Count Guillaum the Great of Burgundy (1057–1087) was the grandson of Duke Richard II of Normandy and himself the father of Guy, Archbishop of Vienne and subsequently Pope Calixtus II (1119–1124), and Raymond, who was betrothed to Urraca of León-Castile about 1087. Raymond was named Count of Galicia about 1088, married Urraca about 1090, and became father of the future Alfonso VII of Leon-Castile (1126–1157) on 1 March 1105. He died on 20 September 1107.

However, the sister of Count Guillaum of Burgundy, Sybil, had married another son of Duke Robert the Old, Henri, and one product of this marriage was that Henri of Burgundy who was married to Teresa, the natural daughter of Alfonso VI of León-Castile, and appointed Count of Portugal in late 1096. He and his cousin, Count Raymond of Galicia, then controlled the entire western third of the kingdom. Count Henri remained the effective ruler of the province of Portugal during the civil war that erupted after the death of Alfonso VI on 1 July 1109, until his own death in that struggle at Astorga in May 1112.

His widow, Teresa, was the half-sister of Queen Urraca and vied with the latter for control of León-

Castile after 1112, though unsuccessfully. From 1112 on Teresa was the independent ruler of Portugal and began to style herself queen after 1117. She remarried into the great Galician House of Trastámara and ruled in Portugal jointly with her new husband, Count Fernando Pérez of Traba, until their expulsion after their defeat by her own son, Afonso Henriques, at the battle of San Mamed on 24 June 1128. Teresa died in exile in Galicia in November of 1130, leaving a daughter, Sancha, by Fernando Pérez.

Her son by Count Henri of Burgundy, Afonso I (1128–1185), was the first king of an independent Portugal. Afonso initially styled himself merely “Infans” of the royal house of León-Castile, but from 1137 began to call himself “Portugalensis Princeps” and after 1140 “Portugalensium Rex.” These changes were accompanied by warfare with his cousin, Alfonso VII of León-Castile, and resulted in the rule of two of the major Iberian kingdoms during much of the twelfth century by the sons of Burgundian counts.

C

CABALA, CABALISM See MOSES DE LEÓN

CABALLERÍA FAMILY

One of the most prominent Jewish dynasties of government officials in Aragón-Catalonia was that of the Caballerías (or Cavallerías, also known as Ibn Labi). Jahuda was the first important member, living in Zaragoza (as did most of the family for centuries), and in 1258 was already royal *baile* (bailiff) for Jaime I. The king borrowed money constantly from Jahuda, but also granted property and ever-increasing power to him. In 1260 he already was granted the power to receive all the taxes of the entire kingdom and was given virtual control over revenues. We do not hear of him after 1276, in which year (or shortly after) he probably died. The Caballerías were related to other powerful families (the Benvenistes and the Alcostantinís) and it was members of the latter family who rose to the highest ranks of government service under Pedro III and Jaime II.

In the fourteenth century we hear of prominent members of the family again in Zaragoza, including at least one doctor. The most important was Bienvenist de la Caballería, who for services to the archbishop was put in charge of all taxes for the region of Teruel (1396), having been an official of the royal treasury for Juan II since 1386. He was highly praised, and his power as an important government official was recognized in a Hebrew eulogy on his death (1414?). His son Juan, a *converso* (convert to Catholicism), became *comprador mayor* in 1414, and another son, Gonzalo (also a converso), reached even higher power as treasurer of certain taxes. Another member of the family, Bonafós, who also converted and took the name Fernando (in honor of the king, Fernando I), became that king's chief treasurer in 1414.

The son of this Fernando was Pedro de la Caballería, a jurist and counselor of Alfonso V, as well as his *maestre racional* (essentially, in charge of the royal household). Like many conversos, he was a rabid anti-

Semite and wrote a stinging denunciation of Judaism (*Zelus Christi*). He tried to convince the authorities he was not of Jewish descent, but failed. Under Juan II of Aragón Luis de Caballería was also an important converso treasurer.

In the reign of Fernando II, (ca. 1485 on), Alfonso, the son of Pedro, was vice-chancellor of Aragón-Catalonia. His grandson Francisco de la Caballería married Juana de Aragón, the great-granddaughter of Juan II (through his illegitimate son Alfonso, who also married a conversa).

There were also important members of the Ibn Labi/Benveniste–Caballería families in Castile, most of whom remained Jewish. One of these was an important rabbi, Vidal b. Benveniste de la Caballería, one of the last in Castile, who negotiated with the king of Portugal for the entry of Jews expelled from Castile in 1492.

CABALLEROS FIJOSDALGO, VILLANOS

In the simplest of definitions, a *caballero* is a man who fights on horseback—that is, a knight. In medieval Castile, the term *caballero* included a whole range of possibilities: from noble knights to non-noble knights living in the countryside or in towns, and to caballeros whose status and military service on horseback was directly related to income—the *caballeros de cuantía*. The definition of these different categories, of the duties and privileges concomitant with the rank depended, to a large extent, on location and on the period. Any attempt at providing a single definition must take

into account all the variations in status, rights, and sources of income that were present in Castile from the tenth to the fifteenth centuries.

A *caballero fijodalgo* usually meant the lowest level of the nobility. They were noble knights, and most of them (except for those of Andalucía after 1250) lived in the countryside. Their income came from peasants' dues collected in their small estates or farms, from service to other more influential or powerful noblemen, and from booty or military service. The term *fijodalgo* (son of something) reveals that nobility was intrinsically linked, at least in Castile, to property. In a society in which almost everyone was liable for military duties, military service was not the monopoly of a social group. Thus, there was not in Castile the clear linking between fighting on horseback and noble status. Others who were not noble also fought on horseback and enjoyed, for all practical purposes, most of the benefits derived from such service. The condition of *fijosdalgo*, however, was hereditary and at the end, unlike that of the *caballero villano*, did not depend strictly on the performance of military duties and maintenance of horse and weapons.

Caballeros villanos, or non-noble urban knights, also served on horseback. Their privileges, above all exemption from most taxes, was directly related to their ownership of a house within the city walls, a horse, and appropriate weapons. This readiness to join the city militias in military campaigns was tested once a year. At the *alarde*, the parading in front of municipal officials with horse and weapons, the caballeros villanos showed that they had the necessary equipment for war. All their privileges derived from the fulfillment of the above conditions. Obviously, the status of caballero villano, if one were a Christian and a citizen of the town, depended strictly on income and was not, at least in the period before 1350, hereditary. Regardless of the dangers of warfare, the privileges granted to the caballeros villanos through the centuries, but especially by Alfonso X in the 1250s, allowed this group to gain a monopoly of the economic, political, and social life of Castilian cities. In the turbulent century and a half that followed the conquest of Seville in 1248, they provided valuable support for the crown. Often, as was the case in 1315, they joined the *fijosdalgo* in leagues, or *hermandades*, aimed at protecting the king from the ambitions of the high nobility.

In Andalucía, after the capture of the south by Fernando III and his son, Alfonso X, the kings of Castile sought to promote the development of the caballeria. In cities, such as Seville, we find *fijosdalgo*, caballeros villanos, and caballeros de cuantía sharing the same urban setting and martial responsibilities on the frontier. In the latter case, those with a certain income

were commanded to maintain a horse and weapon and to render military service. What has been a privilege became an obligation. At the same time, however, the condition and status of caballero villano became, through the ordinances of the *cortes* and royal legislation, for all practical purposes hereditary. By the late thirteenth century and in the late Middle Ages, there was little difference between the two groups, a process of social mobility by which the upper echelons of the Castilian bourgeoisie entered the ranks of the lower nobility.

CABESTANY, GUILLEM DE

(1175–1212) Knight and troubadour from the Catalan region of Rosselló who fought in the Battle of Las Navas de Tolosa (1212). According to the Provençal troubadours' biographies, which attributed a widely spread folk motif to Guillem's life, his romance with Saurimonda ended tragically: Ramon de Castell-Rosselló, the jealous husband, killed Guillem and made the adulteress eat her lover's heart; when Saurimonda realized the horror of it, she committed suicide. This fiction, containing characters who really existed, was the basis of Guillem's medieval fame as an archetype of the martyr of love, and even aroused the romantic interest of historians and writers, such as Stendhal. There are traces of Guillem's fame in Boccaccio's *Decameron* and Petrarch's *Trionfi* or in the Catalan verse vision *La glòria d'amor* of Bernat Hug de Rocabertí. All eight of Guillem's poems (one other is of dubious attribution), written in a perfect Occitan, are love songs that strictly follow the rhetorical pattern of the troubadour *canso*. One of them (*Ar vei qu'em vengut als jorns loncs*) points to Arnaut Daniel's style, because of the difficult rhymes and some unusual comparisons. However, Guillem is mainly a poet of the *trobar leu* who deals skilfully with the courtly love conventions by putting stress on the delicacy of the images (*Aissi cum cel que baissal fuoill*) and by subtle development of a wide range of love sentiments, like in *Lo doutz cossire*, to express the loyal memory of his beloved. This is his finest piece, remarkably written in short lines of four and six syllables, and it had a strong success, prob-

ably related to the legend. It is widely copied in the extant manuscripts; its verse pattern was followed by Cerverí de Girona, among other troubadours, and a fourteenth-century Catalan treatise mentions it twice as a model.

CABRERA, GUERAU DE

Catalan troubadour (1145–1159.) who has been identified as Guerau III de Cabrera, Viscount of Girona and Ager. His only extant poem, a *sirventes-ensenhamen*, (didactic, satirical, political poem) addressed to his jongleur Cabra, accounts for a family interest in letters, besides being reinforced by a chapter of Gervaise of Tilbury's *Otia imperialia* (*De equo Giraldis de Cabreriiis*), though this refers to Guerau IV. Written in sextets (actually two stanzas of three lines), the *ensenhamen* provides us, above all, with a priceless amount of information about the earliest literary Romance culture in Catalonia. The troubadour starts with running down his servant in a comical way and, after making interesting remarks on the abilities required in Cabra's profession (which includes the lyric genres), boastfully lists a wide range of references to works, authors, passages, and characters that his jongleur should know. This rich survey mainly deals with the epic, but also covers the Arthurian field, the myth of Tristan, Romance versions of classical legends (Troy and Alexander), motifs coming from Ovid's *Metamorphoses*, and even some French *fabliaux*. There are, on the other hand, few mentions of the troubadours, all of them of the second generation, since the poem was probably written before 1165. It is remarkable that Marcabrun, included in the list and probably a friend of Guerau, used the same verse pattern echoing both the metrics (*versus tripartitus caudatus*) and the drama monologue that we find in the parodical *sermon joyeux*. Marcabrun's poem *D'aisso laus Deu* seems to be partly a source for Guerau's, but, all in all, the viscount, because of his rather pedantic intention, succeeded in making up a genre. Guiraut de Calanso's *ensenhamen* to his jongleur Fadet is the closest among those that followed Guerau's path and the one which clearly suggests that his model was thought an "ideal library" in his time.

CADAMOSTO, ALVISE DA

Venetian merchant-navigator (1432–1488) in the service of the Infante Dom Henrique (Henry the Navigator), author, and discoverer of the Cape Verde Islands. After sailing extensively in Mediterranean and northern European waters, he was enroute to Flanders in 1454 when bad weather forced him to take shelter at Cape Saint Vincent, near the Vila do Infante of the prince, who sent a messenger to the Venetian fleet. The prince's relation of exotic lands to the south inspired Cadamosto to leave his countrymen's galley fleet and undertake the first significant Portuguese voyage of discovery authorized by the Infante Dom Henrique after a hiatus of eight years (during which, among other things, the Avis rulers were involved in rivalries with Castile over the Canaries and in an abortive assault on Tangiers).

In 1455 Cadamosto proceeded to Madeira and the Canaries, then crossed to Cape Blanco and the Senegal River in Africa, where he visited a chief of the Jalof tribe before going on to the Gambia River, where hostile natives prevented him from exploring it before returning to Portugal. The following year he made a second voyage to Africa, this time with three caravels and another Italian, the Genoese Antoniotto Usodimare. En route to the Gambia, he and Usodimare were blown off course and thereby discovered the Cape Verde Islands before proceeding to the river. This time, he was able to sail up the Gambia for about sixty miles, visit a native chief, and carry on a large barter trade with him and his subjects. Before turning back to Portugal, Cadamosto sailed on south to the Geba River, some 150 miles to the south.

Cadamosto remained in Portugal until 1563, three years after Henrique's death, though apparently as a trader, not as a navigator. But his interest in the African discoveries continued in a literary form; he composed a narrative that appeared posthumously in the *Paesi novamente ritrovati*, published at Vicenza in 1507 and later in Ramusio. It contains not only his own vivid firsthand descriptions of what he personally saw and experienced, but an account of the last explorer's voyage who sailed under Prince Henrique, Pedro da Sintra. Cadamosto's is one of only two firsthand accounts of the classic voyages of discovery under the infante Henrique. The other, dictated by Diogo Gomes in his old age, describes voyaging in the same area, but is vague

and of less value. It once led to Portuguese claims that Gomes, a Portuguese, had first discovered the Cape Verde Islands, but all parties now concede the primacy of Cadamosto.

CAESAR, ERA OF See CALENDAR

CALATRAVA, ORDER OF See MILITARY ORDERS

CALENDAR

The medieval Christian calendar in Spain was complicated, as it was everywhere in the Middle Ages. There was, in fact, no precise fixed calendar, but rather different "eras." The most important of these, for dating, was that simply known as era, which calculated the year from the birth of Christ. However, this was erroneously calculated as 38 B.C., and thus it is necessary to subtract 38 from the Spanish Era date in order to arrive at the actual Christian date A.D. This inaccurate system was replaced in the fourteenth century with the *año del nacimiento* (year of Nativity), or Christian Era (as opposed to Spanish Era) dating. This was put into effect in Aragón in 1349; Valencia, 1358; Castile, 1383; Portugal, 1422. The beginning of the year had been 1 January under the old era, but now became 25 December (except that the Church calculated 11 January as the beginning of the year!). Thus, any date from 25–31 December *año del nacimiento* must be reduced by 1 (e.g., 1455 = 1454 in our reckoning).

To further add to the confusion, there were other "eras" and means of calculation in use. Thus, eleventh-century Catalan documents often figure dates according to the reigns of Carolingian and French kings. In 1180 Catalonia (only) adopted the Christian Era (i.e., *año de la encarnación*). In addition, the old Latin forms of *ides*, *kalendes*, and *nones* are still used in many medieval documents of the kingdom of Aragón-Catalonia.

In the *crónicas* of the thirteenth- and fourteenth-century Castilian kings, one finds a vast additional reckoning of eras (Adam, or Creation; era of the Hebrews [Flood]; Nebuchadnezzar; Alexander the Great; Caesar; the Arabs; Persians; *era de galicianos*

y egipcianos [i.e., Gracian's calendar]; etc.). Pero López de Ayala, in his *Crónica* of Pedro I, gives a detailed account of the various eras then in use.

In addition to the eras, there was also the liturgical calendar, very much in use, dating various saints' days, movable feasts, and so forth, which are often referred to in medieval documents. There are hundreds of these, but those of St. Michael and St. Martin were particularly important tax days. The Toledo church maintained its own separate Mozarabic calendar.

The Muslims had, of course, their own calendar and "era," dating from the Hijra, or migration of Muḥammad to Madīna in 622 A.D., and their own months. This Arab Era was also used in some Christian documents. The Jews, too, had their calendar, dating from the supposed creation of the world, and early Muslims in al-Andalus were quite familiar with this calendar. Jews, on the other hand, were very much at home with the Christian calendar, often citing it in Hebrew documents.

Astrological notions were common to all three communities, and there are various calendars that refer to propitious dates or to particular characteristics associated with each month.

CALILA E DIMNA

A collection of short stories, *Calila e Dimna* was created in India by the sixth century (*Panchatandra*) and translated into Persian (sixth century), and Sirius, and Arabic (eighth century). The first Spanish version appeared by the middle of the thirteenth century. The Spanish text is kept in two manuscripts: one almost complete (A and B in the Library of El Escorial), and a much more rudimentary version coming from the Hebrew (manuscript P of the Library of Salamanca). At the end of manuscript A (H-III-9), it reads: "fue casado de aravigo en latin, et romancado por mandado del infante don Alfonso. . . ." J. Alemany was the first who discarded the use of an intermediate Latin version. The references that this manuscript makes with regard to dating are not very clear either, since it indicates that it was written in 1261 (1299 of the Spanish Era). By those dates, Alfonso X was already king, which has led some to scholars to consider that the translation was done just before Alfonso ascended to the throne

(1251), and thus it would have been one of the first works promoted by the king. Unfortunately, we do not have the codex from the royal scriptorium, though the above-mentioned manuscript, from the first third of the fifteenth century, has several good-quality illustrations. Given the continuous relationship between this work and the royal family, it has also been considered whether this illustrated manuscript would be the copy of the one belonging to Queen Isabel I the Catholic. By those dates, other stories were translated, such as the *Sendébar*, requested in 1253 by Don Fadrique, brother of Alfonso X, or books of sayings (*Poridat de las poridades*, *Bocados de oro*, etc.), which showed the same ideal of teaching the wise man.

The work is, therefore, included in a period of translation and assimilation of the eastern didactics. It is distributed in fifteen chapters plus three introductions, two of them assigned to explain the legendary transmission of the book from India through Persia, and the other serving as preface from the Arabic translator (there is no preliminary text that relates the work more directly to King Alfonso). In the first two introductions appears Berzebuey, a tireless traveler who will try to discover the knowledge later shown in the pages of the book. The Arabic translator, Ibn al-Muqaffa, explains in his introduction the didactic function of the book. According to what it is read, the beautiful words that hide sincere advice are very suitable for the education of the young, if they make an effort to get those doctrines, learn them, and put them into practice. Every other chapter usually works as a narrative model for other short stories, though it is preceded also by the dialogue between a king and a philosopher, lacking in literary character. The king starts the conversation, stating the subject of his concern, and the philosopher answers and teaches the case by means of a somehow extensive story, which often includes several fables belonging to the recourse called the “Chinese box.” The stories, often with animals as the main characters, transmit a secular ethic, with the purpose of praising dignity and avoiding wrong opinions, which is easily assimilated within a Christian context. What can be considered as a basic story is in fact shortened to brief mention, significant for the tale. The brevity of the exposition contrasts with the systematic abundance of dialogues and monologues.

In the Spanish text, there are also structural and thematic differences according to the various creation stages. The first five chapters (with numbers 3, 5, 6, 7 and 8) are closer to the old Hindu collection *Panchatantra*. The series starts with the story that gives its name to the collection; the main characters are two jackals, Calila and Dimna; an ox, Señeba; and a lion. Dimna is a typical example of excessive political ambi-

tion, while the lion is a weakling who is influenced by inadequate advisers. From the beginning, the work suggests a relationship with the genre of “the mirror of princes.” The following chapter, in which Dimna’s death is narrated, was added by the Arabic translator, who was willing to punish the betrayer. From the tenth chapter on, the stories are much simpler, varying human beings with animals. The Spanish version of the *Calila* implies a literary experience that promotes the narrative art and shows a very important step in the development of fiction in a common language, despite its limited distribution. The circulation of the eastern collection through Europe was started when Juan de Capua made a Latin version. Following this translation, the text came back to Spain again, under the title of *Exemplario contra los engaños y peligros del mundo* (1493).

CALIPHATE OF CÓRDOBA See CÓRDOBA, EMIRATE AND CALIPHATE OF

CALIXTINUS CODEX

A manuscript of the Cathedral of Santiago de Compostela, the Codex Calixtinus was written in the middle of the twelfth century. The name derives from the spurious attribution of its authorship to Pope Calixtus II (papacy 1119–1124), who in equally false documents within the text figures as author. Its date, place, and true authorship have been much debated. A date of about 1140, perhaps 1139–43, is logical, at least for the putting of very diverse materials into final form, while the author, or rather, editor of received texts, may have been Aymeri Picaud, whose name figures in the work. As for location, it was at one time held that the Abbey of Cluny in southeast France was an obvious choice, but more recently the Abbey of Saint-Denis in Paris is indicated. The production was largely French, but certain elements show that clergy of Santiago, perhaps canons of the cathedral of French origin, collaborated or contributed. Santiago was certainly to benefit from the production, since the cult of the supposed tomb of St. James the Apostle, patron of Spain and, in his military aspect, heavenly leader in wars against the Muslims, was to benefit from this propa-

ganda, and tens of thousands of pilgrims from all over Europe made the journey annually to this great cult center. *Codex* is the name of the manuscript; the text is the *Liber Sancti Jacobi*, the Book of St. James.

The text is divided into five books. Book 1 has thirty-two sermons on Jacobean themes, book 2 has twenty-two miracles of the Apostle, and book 3 narrates the translation of his remains from the Holy Land to Galicia and includes a papal authentication of this and an account of relevant feasts in the Church's calendar. Book 5 is the *Historia Turpini* or *Historia Karoli Magni et Rotholandi*, the spurious memoir of Turpin, Archbishop of Rheims, who fought beside Roland and the peers at Roncevaux in 778 during Charlemagne's campaign against the Muslims of Spain. Book 5 is the pilgrims' guide to routes to be followed through southwest France and across northern Spain, with notes on peoples to be encountered and shrines to be visited. There follow further hymns, epistles, miracles, and so forth. Book 4 has been much studied because of its importance for the French epic legends, and within the twelfth century it was being copied and circulated separately, its survival in hundreds of manuscripts and vernacular translations testifying to its influence in historiography up to the sixteenth century. The *Codex* as a whole has further importance in art and musical history.

CALLIS, JAUME

Catalan jurist and adviser to the Aragónese kings Joan I (r. 1387–95), Martin I (r. 1395–1410) and Fernando I (r. 1410–12), Jaume Callis was noted for his ability to blend juridical skills with a keen talent for political theory. Born in Vic in 1364, Callis studied canon and civil law in Lleida and Toulouse. After briefly working as assessor in the bishopric of Vic, he turned to a career first in municipal government and later in royal administration. He served as *procurador* at the *cortes* (parliament) of Valencia in 1393, was appointed legal counsel to the royal treasury in 1414, and five years later Alfonso IV (r. 1416–58) named him provisor of pleas to the *cortes* of Cucufate.

His most important contribution to Catalan jurisprudence is his gloss on the *Usatges* of Barcelona, a compilation of customs and laws for the province of

Catalunya. In 1413 he was a member of the royal commission that was assigned with the revision and unification in a single volume the constitutions of the kings, the acts of the *corts*, and the *Usatges*.

CALTABELLOTTA, TREATY OF

The effective end of the War of the Sicilian Vespers was only achieved after many false starts. By 1302 the combatants still in the field had been reduced to the Angevin king of Naples, Charles II (supported by the papacy), and Federico of Aragón, the master of Sicily. Seven years separate the Treaty of Anagni from that of Caltabellotta 1302, when Federico of Aragón was at last recognized by Pope Boniface VIII and the Angevins as king of the island of Sicily for his lifetime, though his territory was renamed the kingdom of Trinacria to assuage Angevin and papal fears that their own title to the entire kingdom of Sicily, island and mainland, was being fatally undermined. In addition to the main island, Federico was recognized as ruler over Malta, Pantelleria, and the other islands in the straits between Sicily and Tunisia, which had been battleground during the Vespers war, and over the Lipari islands to the north of Messina. More tricky was the question of who should exercise control over the straits of Messina, an important trade route, all the more so since northeastern Sicily traditionally received many supplies from Calabria, the toe of mainland Italy. A number of castles on the Calabrian side were thus left in Aragónese hands as a temporary measure, but otherwise troops were withdrawn and prisoners exchanged. The mood was certainly one in which to make peace: Charles II of Naples was short of funds, and his honor was to be salvaged by a marriage alliance with Federico, who took his daughter Eleanor as wife. After Federico's death the kingdom of Trinacria would be dissolved and reunited with the rest of the *regnum Siciliae*, which would retain loose suzerain rights over the island. But the future heir of Federico was also promised aid in the acquisition of alternative rights elsewhere—for example, in Cyprus, which had throughout the war been regarded as a disposable territory (despite possessing its own Latin dynasty).

Church lands in Sicily, many now in noble hands, were to be returned to their rightful owners, assuming Frederico were capable of achieving this. The real difficulty lay in Frederico's own reluctance to accept the short-term nature of his kingdom; he refused to date his reign from the treaty, going back instead to his original coup d'état, and within a few years he was again calling himself the king of Sicily; his eventual nomination of a successor quashed Angevin hopes of a peaceful transition. On the other hand, it has been suggested that the uncertainty over the succession acted as a brake on investment in economic enterprises; in addition, continuing differences with the Angevins made further war certain, despite vain attempts to persuade Frederico to take another kingdom such as Albania.

CAMINO FRANCÉS See SANTIAGO DE COMPOSTELA

CANARY ISLANDS

The colonization of the Canary Islands during the Middle Ages meant the birth of a new historic reality. Three stages can be identified in the development of this process: Rediscovery (1336–1401); the age of lordship (1402–1477); and the age of the crown (1478–1526).

The name of the first stage is due to the fact that the Archipelago was known in classical times but fell into oblivion for most of the Middle Ages. During this same time period, European expansion did not seek to substitute the native (*guanche*) structures, but rather to mold them through commercial or evangelical contacts, which favored the continent's interests.

Despite its limited character, colonization will inherit some important elements from this period: first of all, geographical knowledge. This was obtained through a series of expeditions, the first of which were led by Mediterranean (Genovese, Catalanian, and Mallorcan) sailors, and later by Atlantic (Portuguese and Castilian) sailors. The second element is the economic contribution that is made: slaves, dragon-tree sap, archil, and leather. The third element is the issue of political sovereignty that was raised by the papal investiture of Luis de la Cerda as "prince of fortune." Lastly, it should be noted that during this stage the first contacts with the natives took place. We must acknowledge the important role of evangelizing efforts, which led to the

establishment of the missionary episcopate of Telde. These contacts resulted in the first hint of material as well as ideological aculturation.

The so-called Age of Lordship implies the beginning of actual colonization, with an overall and substantial change from the previous reality. The first action taken to this end was the imposition of an actual sovereignty in the archipelago. This process occurred within the framework of two characteristic phenomena of Europe at that time: the decline of "universal" powers in relation to the states, and the growing rise of the Atlantic countries. This explains why colonization had its origin in Castille, competing with Portugal, with only minor participation from the pope, who acted as an arbiter between different kingdoms.

The conquest of Lanzarote, Fuerteventura, and El Hierro was undertaken at this time. La Gomera was also incorporated, not through military action, but rather through the imposition of a superior power established with the backing of one of the aboriginal groups.

The lack of direct royal intervention that characterizes the Age of the Lordship may be observed in two periods: the Norman-French (1402–1418), and the Castilian-Andalusian (1418–1477). In the first period, Jean de Bethencourt's feudalization meant the creation of an immune lordship. In the second, the Castilian lords (Casas and Peraza) based their power on a jurisdictional delegation from the monarch, not in a feudal pact.

The Age of Lordship is characterized by low population levels. Since the occupied islands were those that were more open to attacks and had less agricultural potential, the indigenous population—which had lower population indexes—diminished even further. In addition, the restricted possibilities for agricultural exploitation hindered resettlement. The region of origin of possible resettlers was restricted to Castilians, French, and natives. Their social structure was simple, even though it had a few *hidalgos* (low nobility) as the top of the hierarchy and peasants at the bottom, with a progressive introduction of natives into the second.

The economy during this period is confined to a restricted level of production, based mainly on livestock and to a lesser extent on subsistence farming, which was complemented by the harvesting of natural products. Commerce provided products that were not produced locally, mainly wheat, wine, and manufactured items, while allowing for the export of raw materials such as archil and slaves and the surplus from local production of leather, tallow, and so forth.

Royal colonization involved direct intervention from the monarchy in three of the seven islands and

a greater presence in the whole archipelago. This intervention led to the creation of a monarchical legal framework in the islands, which can be observed in the norms of local organization (*fueros* and *ordenanzas*—i.e., jurisdiction, regulations) and in the composition of municipal councils, in which the presence of governors and other royal officials was permanent. State intervention was favored by the increasing military cost of the conquest, since the monarchy had greater human and economic resources than the lords. These resources supported the conquest of Gran Canaria, La Palma, and Tenerife.

The population rose significantly during this period as a consequence of three main factors: preservation of the most important indigenous communities; the attraction of a greater number of settlers due to the rise in Europe's population and better economic prospects; and a significant increase in the importance of slavery (blacks and Berbers) within the new economic order. Regarding the new settlers, they were more numerous and represented several social groups. The most notable aspects are the numerical importance of Portuguese settlers, who constitute, together with the Castilians, the majority of royal colonization; and the social importance of commercial colonies (Genovese, Flemish, Catalanian, etc.).

Social organization continued to be based, to a great extent, on land ownership, but money became increasingly important. Economic conditions led to this change. Significant investment was needed to put capitalist production schemes into practice. Due to this, the aristocracy had a twofold origin: on the one hand military, and on the other, commercial. Economic diversity became more difficult due to the differences in judicial statutes and the persistence of diverse mentalities within the various groups. All these factors led to greater difficulties in the aculturation process, such as those affecting indigenous communities.

The economy of this period was characterized by general growth, both with regard to the number of products involved and to the levels of production reached. Agriculture was based on the consolidation of subsistence crops (grain, grapes) and the introduction of cash crops (sugar, pastel). Livestock kept its privileged position, although it was no longer a priority, since it conflicted with the flourishing agriculture. The harvest of natural products also became important, although their relative significance within overall production decreased. Due to the greater demand for crafts products, the export of raw materials decreased. Thus, leather, cloth, metal, and clay crafts were born, whereas high quality products were imported. Commerce increased dramatically as a consequence of several circumstances: the privileged position of the is-

lands on African and American routes, the existence of export products, and the settlement of commercial colonies.

CANELLAS, VIDAL DE

Thirteenth-century churchman who served as bishop of Huesca. From the sixteenth century on historians have praised both the work and special human qualities of Vidal de Canellas, yet little is known about his origins. In all likelihood, he was born in Barcelona. He studied at the University of Bologna in Italy, where his presence is documented in 1221. He died in 1252. Related by blood to Jaime I the Conqueror, King of Aragón, Vidal served as his counselor and confidant and was by the king's side during the Aragónese assault on Valencia in 1238. Vidal is said to have been the compiler of the *fueros* (municipal codes) of Aragón, assembled during the *cortes* (parliament) of Huesca in 1247. He most likely also intervened in the composition of the *furs* (fueros) of Valencia. The legal commentary *In excelsis Dei thesauris*, known commonly under the name of *Vidal mayor*, is also from

his hand. Vidal was reputed to have been an excellent and impartial arbiter in legal disputes as well as a worthy trustee.

CANTAR DE LOS INFANTES DE LARA

One of the major narratives of the medieval Castilian epic, the *Cantar de los infantes de Lara* is known in three different versions partially prosified in Alfonsine and post-Alfonsine chronicles: Alfonso X's *Primera crónica general* (*Estoria de España* before 1289); Pedro Afonso, Count of Barcelos's *Crónica Geral de Espanha de 1344*; and the anonymous *Interpolación de la Tercera crónica general* (late fifteenth century). The narrative tells the following story: Seven brothers, the lords of Lara, sons of Gonzalo Gustioz, become involved in a violent altercation during the wedding celebrations of their uncle, Ruy Velázquez, who has married Doña Lambra, an impetuous, manipulative woman of fiery, unrestrained emotions (*lambra* < Latin *flamula*). The initial offenses, fomented by Doña Lambra, gradually escalate, until Ruy Velázquez, filled with implacable hatred, betrays his nephews on the field of battle, abandoning them—gravely outnumbered—to face an overwhelmingly superior army of Muslims. After fighting valiantly, the infantes are beheaded and their heads are taken as trophies to Córdoba and shown to the caliph, Almanzor (based on the historical Al-Manṣūr). Gonzalo Gustioz happens to be at Córdoba as a Christian emissary, sent there by Ruy Velázquez with a "Uriah letter," asking that the bearer be executed. Almanzor asks Gonzalo Gustioz to identify the Christian heads. Frantic with grief, the father seizes a sword and strikes down a Muslim guard. Almanzor, instead of having Gonzalo Gustioz killed, puts him in prison but, pitying his bereavement, sends a Muslim noblewoman to console him. She bears him a son, Mudarra (Arabic *mudharra* "of mixed ancestry"), who is educated at Almanzor's court and, years later, arrives in Castile with an army of followers, converts to Christianity, and wreaks bloody vengeance upon Ruy Velázquez and Doña Lambra.

The historical basis of the *Cantar* has gradually emerged from a meticulous exploration of notarial documents and Arabic historical sources. The epic accu-

rately reflects the geography and the military and political circumstances of the late tenth-century Sorian *frontera*. Many of the major players are likewise attested in contemporary documents: Gonzalo Gustioz, Ruy Velázquez, Diego González (the eldest of the infantes), Count Garcí Fernández, and the Muslim frontier commander, Ghālib ibn 'Abd al-Rahmān (Galve). The epic's historical basis—aside from its many legendary components—is beyond dispute.

The *Estoria de España* records an early version of the narrative in which the second part—Mudarra's vengeance—is not developed in detail. Comparatively speaking, the *Estoria* version has been severely prosified, but even so a number of assonances and vestiges of formulaic verses still survive in the chronistic prose. The *Crónica de 1344* and the *Interpolación* both record two closely related traditional versions of a later *remaniement*, in which the second part is fully developed, achieving an aesthetically successful balance between the two segments of the narrative. Both chronicles combine historiographic and oral sources, supplementing the *Estoria de España* account with portions of fourteenth-century traditional texts. Where the Alfonsine narrative and the minstrel versions did not differ essentially, both histories copied the earlier chronicle, but when oral accounts diverged from the *Estoria de España*, the *Crónica de 1344* and the *Interpolación* chose minstrel texts, prosifying their sources very superficially, so that both works offer invaluable testimonies that preserve lengthy series of consecutive assonant verses. In numerous instances it is almost as if we had before us poetic fragments of the original *cantar de gesta*.

It is important to bear in mind that the *Crónica de 1344* and the *Interpolación* are not using identical texts of a fourteenth-century *Cantar de los infantes de Lara*. The chronicles reflect closely related versions, but in many instances one history will record one traditional formula while the other will use a different, though roughly equivalent, one: "la media poblada e la media por poblar" (*Crónica de 1344*, v. 94); "la media es çercada e la otra por çercare" (*Interpolación*) ("Half has been repopulated and the other half has not; Half has been fortified and the other half has not"). The two chronicles likewise offer mutually supplementary accounts, having chosen to record different segments of their epic sources. The *Crónica de 1344* and the *Interpolación* thus provide a unique opportunity to observe the process of oral variation in an Old Spanish epic poem, strikingly similar to what is seen in many Old French *chansons de geste* (songs of deeds) and also in modern Hispanic traditional ballads.

Though obviously many features of the original poetic texts have been obliterated in the process of

chronistic prosification, the heroic narrative has been preserved well enough to offer invaluable evidence of its anonymous authors' poetic artistry. A sense of doom and fatal inevitability pervades the story. The young nobles' unreflective impetuosity (*desmesura*), Doña Lambra's manipulation and thirst for vengeance, Ruy Velázquez's implacable hatred and ultimate treachery will all lead inexorably to violence, betrayal, and death. The artistic structure, especially in the later *Refundición* recorded in the *Crónica de 1344* and the *Interpolación*, reveals a series of finely crafted parallelisms that show the poetic awareness of generations of *juglares* (minstrels) who gradually elaborated the *Cantar de los infantes de Lara* as we now see it in the medieval sources. The figures of Gonzalo Gustioz and Ruy Velázquez, who are present in both halves of the narrative; Mudarra, whose identical appearance will replicate, in the second part, the youngest *infante*, Gonzalo González, who was killed in the first part; the treacherous vengeance of Doña Lambra, at the beginning, balanced against the justified vengeance of Doña Sancha at the end; the gradual escalation of violent aggressions in the first part echoed in Mudarra's long delayed vengeance in the second part, as he pursues the traitor, Ruy Velázquez, from one town to another, always arriving too late to accomplish his purpose; the recurrent themes of blood, birds of prey, and fatal wedding festivities offer cogent parallelisms and ironic contrasts that strengthen the artistic unity of this admirable narrative.

The *Cantar de los infantes* did not disappear from oral tradition. In 1476 Lope García de Salazar summarized various features of yet another traditional account in his *Bienandanzas y fortunas*, and several *romances viejos* attest to the partial survival of late epic versions in ballad form. The horrendous scene of the seven heads is perpetuated down to modern times among eastern Mediterranean Sephardic Jews as a ballad of mourning (*endecha*), but this cannot count as a song of direct tradition, being based on a late and semi-learned reworking from the final years of the sixteenth century.

CANTAR DE MIO CID

The *Cantar de Mio Cid* is the only Old Spanish epic to survive more or less complete. It was influential in its day and for some centuries, particularly when a prose version of it was incorporated into the national chronicles: the Cid became the national hero, and the poem about him, the earliest long text in Castilian verse that we have, is a cornerstone of Spanish literary culture. In recent times its poetic qualities and narrative and dramatic power have been amply appreciated.

The poem survives in a unique fourteenth-century manuscript long kept in a convent in Bivar, where the manor of the historical Cid was situated; after many vicissitudes since the late eighteenth century, the manuscript was acquired by the Spanish state in 1960 for the Biblioteca Nacional in Madrid. Closing lines of the text show that it was copied from, or derived in a series of copies from, an original of 1207, the work of copyist or author Per Abbat concluded in May of that year. In its present state the text has 3,730 lines plus its explicit, a few more lines in which a presenter takes leave of his public. Since the first folio and two in the interior are missing, and the scribe writes about fifty lines on each folio, the poem when complete had a little less than four thousand lines, thus corresponding closely (and perhaps not accidentally) to the prime version of the *Chanson de Roland*. The manuscript has some errors of copying and fails to record many line divisions correctly; diverse reasons for this have been suggested, among them that at some stage the work was written as lines of prose (as happened to other verse texts) and was inaccurately reconstituted later. Loss of the first folio prevents us from knowing if the poet gave his work a title, but he would certainly have announced his theme and addressed his audience, as in French epic. The word *cantar* appears within the text (line 2276) when defining one of the three sections into which the work is divided and is used in the chronicles about whole epics; *Poema de Mio Cid* is a common modern alternative, if anachronistic.

The origins and nature of the poem, as of the epic genre as a whole, are much debated. The *Cantar* may have been a member of a possibly large, age-old family of orally generated poems, evolving in an unbroken series of variant versions until (and of course after) being fixed in writing by a scribe who recorded a performance: such is the view of the "oralists." "Neo traditionalists," that is, Menéndez Pidal and his school believe similarly in the antiquity of the unbroken process, the close association of poetic creation with historical fact (thus dating the earliest version of the *Cantar* to within a few years of the Cid's death in 1099, and the present text to about 1140), and the force of the creative variant produced by the *autor-legión* working at popu-

lar level; they seem not wholly to exclude writing from both the original composition and transmission process, and hold that texts were memorized as well as extemporized for performance. In the “individualist” view, all such poems are relatively late compositions by authors of at least modest learning, in writing. Their sources included not only folk memory (in the case of the Cid, local knowledge and pride in Burgos, the home of the hero) but also written history, archival materials held in a city or monastery, French epics known from auditions and in writing, and in certain cases Latin texts known in extracts, the whole being moulded by the individual poetic imagination into a coherent literary construct. Facts of history that were known might be used but much adjusted for literary purposes. In this view, the poet was a responsible public figure who may well have had to please a royal or noble patron with an appropriate message about contemporary political and military concerns—in the case of the *Cantar*, perhaps legal reform, kingly duties, action against the Almohads, and relations with the Spanish Moors—while genealogical and monastic connections were relevant also. Many in consequence would now date the *Cantar* to the first years of the thirteenth century, perhaps to 1207. It is notable that Duggan, a convinced oralist, has original arguments in his 1989 book for a date very close to this, and very precise, too: “in the year 1199 or, more likely, 1200.”

As for the place of composition, Medinaceli or elsewhere in the frontier region of southeast Castile, Burgos, and even Navarre, have been recently proposed. Smith is the only student to argue that the *Cantar* was the first work of its kind in Castilian, an effort (with features denoting a tentative or experimental composition, but masterly too) to provide Castile with a national poem to rival the best French *chansons de geste* he knew so well; and that he triumphantly succeeded and even outdid his models.

Discussion of the metrical structures of the *Cantar* is conditioned by the above views: the poet may have followed traditional practice, or invented a new system that was then followed in other epics. His lines are assonanced and grouped to form *laises* (*tiradas*, *series*), as in French. Starting and ending a *laisse* obeys some observable but rather loose criteria, such as changing a speaker or a place. The line has a clear caesura. Line lengths vary greatly, continuing to do so even after adjustments (on which editors more or less agree) have been made to the manuscript readings. Probably no syllable count is applicable, the system having a basis of stresses, still variable but typically two or three to each hemistich. This accentual system obviously contrasts with the syllabic bases of French. Many of the poet’s lines are pleasingly rhythmical, and

many too have the extra force of internal assonances both “horizontal” and “vertical,” enriched rhyme, and so on.

The poet’s language is simple, direct, evocative, notably economical, with a special power in the direct speech that forms a high proportion of the text. The epic is essentially narrative, and we are occasionally reminded of the presence of the narrator, but analysis in terms of drama is very rewarding, especially when we bear the listening public in mind and assume the presenter’s ability to vary his voice and reinforce diction with mime and gesture. Power of language is not much affected for moderns by the strongly formulaic nature of much of the rhetoric (proof for some that this and other poems were orally generated, for others adapted in part from French and then imitated in native ways, and equally useful in the written medium). Many stylistic features and much of the direct speech were preserved in the prose versions of the chronicles; any may thus have been influential in the very creation of Castilian prose discourse.

Those acquainted with the Cid of the ballads and Golden Age plays, with Corneille, and with the film, will be surprised to discover the unromantic, earthy, middle-aged hero of the *Cantar*. He enshrines virtues obviously thought important to the poet and his public and has a pleasing modernity in some ways, too. In the first *Cantar* he is unjustly exiled by his king and forced to make his way with a few followers into Moorish lands, where he starts to win wealth and local power. At first no more than a gentlemanly brigand, as his army grows he eventually defeats a semi-royal personage, the count of Barcelona, and the forces of his state, winning immense booty. He follows this at the start of the second *Cantar* by capturing Valencia and defeating the vast army of Almoravids sent to recover it, appointing a bishop and settling in the city with every sign of intended permanence, especially by sending for his family—Jimena, two daughters, and their entourage. The two young Infantes de Carrión are attracted by the Cid’s wealth and, with direct approval and involvement from the crown, marry the Cid’s daughters after the hero has been received back into royal favor. The *Cantar* ends on a triumphant note but with a hint of foreboding. In *Cantar III* the infantes disgrace themselves by cowardice when the domestic lion escapes and in battle against King Búcar’s Moors. Having lost face, they resolve to avenge themselves by an outrage against their wives, whom they automatically repudiate, committed while journeying to their homeland. The collective dishonor caused to the Cid’s family and men is washed away when the hero wins his action in the royal court assembled in Toledo (the high point of the poem’s rhetoric) and when his men

later defeat the Infantes and their brother in judicial duels. The daughters, recovered from the outrage, marry Iberian peninsular royalty, and the Cid dies peacefully in honor, assured that his line will continue royally (a claim amply justified in historical reality by the poet's time). At all points the author's precision in terms of geographical locale, routes, the seasons, even the time of day, convinces us of the essential truth of his tale. Some themes will be evident from the foregoing synopsis, but all are best followed up in the now immense bibliography, since emphasis has varied.

CANTARES DE GESTA See POETRY, SPANISH, LYRIC, TRADITIONAL

CANTIGAS DE SANTA MARÍA See ALFONSO X, ELSABIO, KING OF CASTILE, POETRY AND PROSE WORKS

CANTAR DEL CERCO DE ZAMORA

Briefly summarized in the *Crónica Najerense* (1143–1157) and known in greater detail in partial prosifications absorbed by Alfonso X's *Primera Crónica General* (*Estoria de España*) (1289) and the anonymous *Crónica de los Reyes de Castilla* (ca. 1300), the epic poem of *El cerco de Zamora* (*The Siege of Zamora*) helps prepare the events of the *Cantar de Mio Cid* and, in its own right, is one of the most important *cantares de gesta* (epic songs).

The narrative concerns the following events: On his deathbed, Fernando I of Castile and León divides his kingdom among his three sons, giving Castile to Sancho, León to Alfonso, and Galicia to García, and leaving the city of Zamora to his daughter, Urraca. Sancho usurps his brothers' lands and imprisons García, while Alfonso flees into exile in Toledo. Sancho then lays siege to Zamora. Pretending to flee from the besieged city, a treacherous *zamorano*, Vellido Dolfos (Bellidus Ataulfus), ingratiates himself with the Castilian king and, promising to show him a secret door through which his troops can enter and capture the city, lures Sancho into going alone with him to

inspect the city's walls, fatally stabs him in the back, and then flees back to Zamora. The Zamorans imprison Vellido, but a Castilian champion, Diego Ordóñez, challenges the city and its inhabitants to prove in single combat that they were not involved in Vellido's treason. By law, anyone challenging a city must fight against five consecutive champions. One after another, confident in the justice of their cause, three sons of the venerable Zamoran patriarch, Arias Gonzalo go out to meet the Castilian challenger and are killed, but the third Zamoran champion, Rodrigo Arias, seriously wounds Diego Ordóñez and mortally wounded himself, strikes Ordóñez's horse, which flees, carrying the Castilian challenger outside the legally prescribed battle area (*cerco*).

The judges (*fieles*) then declare there should be no more fighting and refuse to designate a winner. Vellido's punishment is left unspecified and Alfonso returns from exile in Toledo to take over a reunited kingdom, after swearing (perhaps equivocally) that he was not a party to his brother's death. The epic thus ends on an inconclusive, ambivalent note, but such an ending, which at first glance might seem to be a flaw, rather represents one of the lost poem's major achievements. At a time when the concept of a united Spain did not yet exist, the *Cerco de Zamora* achieves a suprarregional perspective in which no one is totally to blame and no one is completely vindicated, instead, a complex human situation is evoked in all its conflictive ambivalence. Who is guilty, García, who first gave Sancho the excuse to usurp his brothers' lands? Sancho, for his impetuousness, greed, and ambition? Alfonso, who may somehow have plotted Sancho's death? Urraca, for having (unwittingly?) fomented Vellido's treachery? The Cid, who failed to advise the brothers, as he had promised the dying King Fernando? All share in the tragedy of this Hispanic *Iliad*.

The structure of the *Cerco de Zamora* is eminently familiar. Like the *Chanson de Roland*, the *Nibelungenlied*, and the *Infantes de Lara*, a family quarrel leads to a treacherous outrage, for which vengeance must later be exacted and order eventually restored. That here vengeance is avoided and judgment is withheld distinguishes the *Cerco* as a remarkably innovative poem. But the lost poem (or poems) consulted and partially prosified in the *Estoria de España* and in the *Crónica de Castilla* are not our only available witnesses. A number of late-fifteenth-century chronicles, undoubtedly reflecting contemporary oral tradition, do specify the traitor's punishment. Here, like Ganelon in the *Chanson de Roland*, Vellido Dolfos is tied hand and foot to four wild ponies and is torn apart. Two brief epic poems, *La partición de los reinos* (*The Division of*

the Kingdom) and *La Jura de Santa Gadea* (*The Oath at Santa Gadea*) may well have functioned as prologue and epilogue to the *Cerco*. The sixteenth-century ballad *Rey don Sancho, rey don Sancho, no digas que no te aviso!* (*King Sancho, Never Say You Were Not Warned*) derives directly from an epic source. The *Estoria de España* attests to a few of the epic's *í-o-* assonances, while the *Crónica de Castilla*, independently reflecting a variant poetic text, includes many additional rhymes. Several episodes pertaining to the *Cerco de Zamora* have survived in ballad form down to the present day. Some may derive from epic sources, but most are clearly based on later retellings.

CÃO, DIOGO

Portuguese navigator in the service of João II who explored the African coast as far south as Cape Saint Catherine; his most memorable discovery was the Congo River. His itineraries and other accomplishments are unclear, as are the dates of his birth and death. He was descended from a Trasmontane family that had fought for Portuguese independence in the 1380s and, according to tradition, was born in Vila Real. The first mention of him is from 1480, as already being in the service of João II as a navigator; it is recorded that he returned from Africa with captured Spanish vessels.

In 1482 his career as an explorer seems to have begun on an expedition that stopped at San Jorge da Mina (Elmina) before proceeding south into the unknown seas beyond Cape Saint Catherine. It was on this voyage; that he discovered the Congo (Zaire) River and planted the stone pillar known as the *Padrão de San Jorge*. He then proceeded south to Cape Santa Maria, where he erected another *padrão* before returning to Lisbon.

He brought with him four *Sonyo* nobles taken as hostages in return for the safety of Portuguese crew members, who had been sent on an embassy to the Manicongo but had not returned before the ship sailed. The nobles were treated well; according to the chroni-

cler Barros, the intent was to teach them the Portuguese language for future communication with natives of the region. João II was highly pleased with the results of the expedition and ennobled Cão, apparently believing, that his navigator had approached "the Arabian Gulf."

The outlines of Cão's second voyage of 1485 are much hazier, but it is known from Barros that he returned the hostages to their homeland; he then, planted a *padrão* at Cape Negro, Morocco, according to Martin Behaim's globe of 1492, and another at Cape Cross, before reaching Walvis Bay. During this voyage he seems to have visited the Manicongo, at least according to the chroniclers Rui de Pina and João de Barros. And, given the authenticity of inscriptions on the cliff at Ielala, he sailed his ships a hundred miles up the Congo River. Otherwise, reports on this second voyage are contradictory. A legend on the famous globe by the German cartographer Martin Behaim, *hic moritur*, has been taken to indicate Cão's death, probably in 1486, though Barros does not mention it in his *Decades*, (I, book 3, chapter 3) and speaks as if Cão returned safely home. Whether or not Cão actually returned from this second voyage, he fell into complete obscurity. The late Damião Peres suggests (based on the Soligo map) that Cão may have incurred the displeasure of João II (and subsequently fallen into obscurity) by asserting that he had found the terminal cape of Africa—which turned out to be only a deep, but blind, bay.

Two other confusions render even the briefest biography of Cão uncertain: the fact that one or more other voyages of Portuguese discovery somewhat overlap his and easily become confused with them, and the question of whether Martin Behaim accompanied Cão and labeled his maps in accordance with the explorer's discoveries.

CAPE VERDE AND THE CAPE VERDE ISLANDS

The Cape Verde Islands were the last of the Atlantic Old World archipelagos to be discovered, and because they lie so close to Cape Verde (which gives them their name), their relationship with the mainland was intimate from the beginning. Though no copy of the original donation from Afonso V to his uncle, the In-

fante Henrique, survives, it was surely made soon after the return of Alvise da Cadamosto, its discoverer, and of Diogo Gomes, for Henrique left it in his will to the Infante Fernando in 1460. Its developmental pattern followed those of Madeira and the Azores, wherein the proprietor, in this case Fernando, divided the islands into captaincies and assigned their donatary contracts, in one instance to the Genoese, António de Noli, who may have visited the islands in the year after their discovery.

From all evidence, the captains had little trouble in finding colonists, if only because Henrique had created a *feitoria* (trading post) up the coast at Arguin about the same time the islands were discovered; this must have suggested that a fairly proximate base of operations could yield rich benefits. In 1462 and 1466, they were given important rights to trade on the mainland opposite, and they seem to have been sufficiently influential by 1469 (when concessions were given Fernão Gomes to carry out further explorations southward) that their rights were specifically protected.

The settlers were primarily slave traders, and they would not have descended on the islands so swiftly if their motives had been agricultural. Even so, cotton growing soon became a possibility; cloth was one of the prime barter commodities for slaves, and the semiarid nature of the islands was well suited to cotton (being too dry for sugar). Slaves were already at hand, and it was but a simple step to convert their labor to the plants, the thread, and the cloth production itself. It was even discovered that the lichen *urzel* would flourish there, and this yielded a purple dye that was used both for the textiles and for export. Afonso V even went so far as to make its export a monopoly, granting it in 1469 to two Spaniards, Juan and Pedro de Lugo. Another boon to the insular economy was the discovery that even a type of cowrie found in relative abundance on the island was worth money—in fact, it was money to the Africans on the mainland, where it was far rarer. In 1480, the crown even attempted to prevent their inflation by forbidding unlicensed persons from exporting them illegally.

Few Portuguese were eager to settle on the mainland opposite the islands, and in fact, this remained under their jurisdiction for centuries. The only European population there, in fact, were outcasts, the *lançados*, soon interbred with the native populations, plus some maroons or recluses of uncertain origin. These traded, usually clandestinely, with the inhabitants of the islands (to the annoyance of the crown) and served as intermediaries with the inland chieftains. Royal attempts to amnesty or repatriate them all seem to have failed.

CARBONELL, MIQUEL

Notary public, bibliophile, antiquarian and historian, (1434–1517), born in the Plaça Nova, Barcelona. He occupied the post of royal archivist from 1476 but his abiding passion was books and manuscripts, even to the detriment of his family. A self-taught dilettante in scholarship, he left a pedantic but picturesque image of himself in the marginalia of books and chancery registers. His library consisted of over sixty titles; there are no works in the vernacular nor any that do not relate to the humanities. The most attractive facet of his literary activity is his extensive Latin correspondence with his fellow lawyers; the Italian tutors at court, Antonio and Alessandro Geraldini; and his most learned cousin Geroni Pau, the first of the Catalan hellenists. His historical ideas were largely shaped by the advice of Pau and the knowledge drawn from his library. The influences are made explicit in his *De viris illustribus catalanis suae tempestatis libellus*, where he also claims that Bartolommeo Fazio was his model for this collection. The range of professions covered is not as wide as in Fazio's equivalent Italian work; the majority are lawyers whose main merit lies in the study of the humanities. His major work, the *Chròniques d'Espanya*, is a rather turgid exposition written over a long period and intended to expose the errors of an earlier chronicler, Pere Tomich. This is the only work he wrote in Catalan. Clearly intended as a eulogy of the Crown of Aragón, it ends in a climactic praise of the cultural patronage of Alfonso V, "which had awakened the nation from barbarity." The chronicle derives from such sources as that of San Juan de la Peña, of Pedro the Ceremonious, documents from the archives of the Crown of Aragón, a letter of Leonardo Bruni, and the biographies of Alfonso V written by Fazio and Beccadelli. It was not printed until 1547 in Barcelona.

CARLOS, PRINCE OF VIANA

The political life of Spain at the end of the Middle Ages can be traced through the fortune of Carlos and

his half-brother Fernando of Aragón. As heir first to the throne of Navarre (as his title of Prince of Viana indicated), then to the throne of Aragón-Catalonia, Don Carlos might have unified the lands of the Ebro River valley, whose people were strongly attached to their local privileges. His failure to do so allowed Fernando to unite Aragón and Castile by marrying Isabel the Catholic and to start a process of centralization that took little account of the regional *fueros* (municipal charters). The genealogical tree of the Trastámaras shows the two marriages of Juan II of Aragón, that created the complex family situation that, in turn, was to cause numerous family wars. Juan, the second son of Fernando I of Aragón, could not really expect to get a crown; however, his marriage to Blanche of Navarre made him the prince consort in her kingdom; then, when the elder brother Alfonso the Magnanimous died without heir, he also became King of Aragón. However, he decided by every means at his disposal to deprive his elder son, Carlos, of the throne in favor of his younger son, born of his second marriage to Juana Enríquez, the daughter of the admiral of Castile. When his mother Blanche died, Carlos should have inherited Navarre; but, as Blanche had, in her will, asked her son to get his father's consent, Juan took this opportunity to proclaim himself king, simply making Don Carlos his lieutenant general. Don Carlos was very respectful of the local *fueros* and thus made himself very popular. This led to a first war between the father and the son. There was a further crisis when Alfonso the Magnanimous died, making his brother Juan the king of Aragón, and Carlos the heir to the throne. His father, who had already dispossessed him of Navarre by giving his rights to the count of Foix-Béarn, maneuvered once again to deprive him of Aragón in favor of his half-brother Fernando. Again, there was fighting between father and son. As a result Don Carlos was again appointed lieutenant general in Catalonia. He displayed there the same qualities he had during his rule in Navarre. This prince was a scholar with a magnificent library, and he wrote a remarkable "Chronicle of Navarre." He died of tuberculosis in Barcelona in 1461. The Catalans gave him a royal burial and therefore venerated him as a saint. As he had no descendant, he left the way free for his half-brother Fernando, who then went on to unite Aragón and Castile, and for his sister Eleonor, who united Navarre with Foix-Béarn.

CARMELITES See RELIGIOUS ORDERS

CARMEN CAMPIDOCTORIS

The *Carmen* is a song of praise of the Cid. It survives in a unique copy in a manuscript of Ripoll and was composed by a monk of the house. The text is incomplete; it consists of 128 lines (and two words of 129) in four-line stanzas of rhythmic sapphics, and it was a kind of hymn designed to be sung. The best edition is that of Wright, with English version and full commentary. While most have thought it composed during the Cid's lifetime, about 1083, Smith argues that it is of the later twelfth century, being based largely on the *Historia Roderici* written in the middle of that century.

The poem is a spirited evocation of aspects of the hero's fame, in simple but expressive Latin with biblical, Virgilian, and other resonances. After an invocation in which comparisons are drawn with classical heroes and Homer, there is a call to an assembled public and then rapid mention of the Cid's birth and early deeds. There follows a more detailed account of the Cid's relations with Alfonso VI and of the hero's exile. Finally the poet presents his subject splendidly arming for the battle of Almenar in 1082, the text breaking off at the point where the Cid prays for victory. Most have thought this the concluding episode, but Smith argues that the poem was more extensive and was to cover at least the Cid's conquest of Valencia in 1094, his greatest triumph.

CARRILLO DE HUETE, PEDRO

Halconero mayor (Chief Falconer) of King Juan II (1406–1454), Pedro Carrillo de Huete is best remembered for his *Crónica del halconero de Juan II*, an account of the events of the reign of that king, written largely from memory, ca. 1435–1454, but also supplemented with numerous important documents. The work exists in four manuscripts, which represent three

different versions: the *Crónica del halconero* itself (Biblioteca Nacional Madrid, MS 9445, partially copied in that library's MS 12373); a *Refundición de la crónica del halconero* (Escorial MS X.II.13), expanded and emended by the famous bishop Lope de Barrientos (who would also purge the library of Enrique de Villena at the behest of Juan II, burning part of it), and a summary of the original, useful for filling its lacunae, the *Abreviación de la crónica del Halconero* (Biblioteca Universitaria de Santa Cruz de Valladolid. MS 225). Dedicated to Juan II and interested in documenting the historical events of his time from the Royal Court of Castile to the frontier of Granada, Pedro Carrillo began his account around 1435 as a continuation of the official chronicle of Castile, 1406–1435, written by Alvar García de Santa María, and ended it before 1454 inasmuch as Juan II is referred to as having died. His successor as halconero mayor was Miguel Lucas de Iranzo, who began to serve Enrique IV in 1455.

Apparently a modest, uncomplicated man, Pedro Carrillo had little interest in politics and maintains considerable impartiality throughout his narrative (see, for example, his equanimity in describing the powerful figure of Alvaro de Luna). However, such objectivity detracts from the artistic, belletristic quality of the work: it is essentially a diary of events—military expeditions, parties, and tournaments—although the chivalric aspects of a given situation (especially one in which he has participated directly) brings some emotion to his prose, such as the case of the extraordinary (and almost comic) taking of the castle of Montalbán on behalf of Juan II, virtually unguarded inasmuch as its *alcaide* (castellan) was outside hunting “de perdices con bueyes” (partridges with oxen). Leaving Diego López to secure the gate, Pedro Carrillo climbed unopposed to the tower (although the actual “taking” lasted “dos oras e media” (two and one-half hours) in order to call chivalrously to his king “Andad, señor, que vuestra es la fortaleza!” (Come forth, my lord, the fort is yours). The work contains an introduction and 387 chapters; some 200 documents have been used in preparing the *Crónica*, approximately forty transcribed in their entirety. “Cameos” of famous figures of the 1400s include, among others, Diego de Valera, Alvaro de Luna, the Marqués de Santillana, Fernán Pérez de Guzmán, and Enrique de Villena. Pedro de Carrillo's history is an excellent mirror of the life of its day.

CARRILLO, ALFONSO, ARCHBISHOP OF TOLEDO

Born in 1410, Alfonso Carrillo was regarded by some of his contemporaries as being typical of the kind of prelate whose promotion within the ecclesiastical hierarchy owed almost everything to his social background and political activities and virtually nothing to his religious merits. He was the son of Lope Vázquez de Acuña and nephew of Cardinal Carrillo de Albornoz who in turn had been closely related to Pedro de Luna, archbishop of Toledo, and also to Benedict XIII. In addition, Carrillo was the brother of Pedro de Acuña, count of Buendia, and the uncle of Luis de Acuña, bishop of Segovia and Burgos, and of Pedro Birón, master of the order of Calatrava. He succeeded his uncle as bishop of Sigüenza, and his promotion to the archbishopric of Toledo in 1447 was the reward for political and military support in favor of Juan II against the rebel nobility.

Aristocratic and politically minded, Carrillo could also be a formidable opponent on the battlefield. In his *Claros varones de Castilla*, Pulgar depicted him as bellicose and aggressive, always involved in assembling armies and participating in war. Pulgar also observes that Carrillo accumulated wealth not because he was greedy but in order to be generous and distribute largesse.

Carrillo played an important role during the confused political events of the reign of Enrique IV (1454–1474). Close to the king during the early years of the reign, he subsequently became involved in almost all the anti-royal conspiracies of discontented nobles, playing a substantial part in wrenching concessions from the crown, and as one of the leading participants in the curious deposition of an effigy of Enrique IV in the Farce of Avila of 1465. He supported the “antiking” Alfonso, Enrique IV's half-brother, during the ensuing civil war, and when Alfonso died in 1468 he threw his support behind the future Queen Isabel I the Catholic, being responsible for the falsification of the papal dispensation required for her marriage to Fernando of Aragón. On the accession of the Catholic kings in 1474, Carrillo took umbrage at the influence of the powerful Mendoza clan at court, retired to his estates, intrigued in favor of the supporters of Enrique IV's putative daughter, Juana “la Beltraneja,” and on the failure of these machinations alleg-

edly spent his remaining days in fruitless attempts at trying to acquire more wealth by the study and practice of alchemy. He died in 1482.

Despite his capacity for political intrigue and his involvement in military campaigns, it may be that Carrillo's reputation was to some extent damaged by the hostility of chroniclers. The text of a letter of criticism and advice that he sent to Enrique IV, contained in the chronicle of Diego Enriquez del Castillo, suggests a sound grasp of the need to reform the political and socioeconomic ills of the kingdom. Moreover, when the rebellious Catalans invited Enrique IV to be their king, Carrillo resisted the costly schemes that would involve ruinous expenditure and war in Aragón, Catalonia, and Valencia. Above all, Carrillo's participation in the Farce of Avila in 1465 was not simply that of an unlettered thug. He had been the president of the Castilian embassy at the Council of Basel and was familiar with all the sophisticated arguments about papal and royal powers that had been advanced by such outstanding political thinkers as Juan of Segovia and John Turrecremato. Indeed, his awareness of the problems that had surfaced at Basel informed the precise nature of the grounds for the king's deposition at Avila; a charge of heresy, which would have allowed for direct papal intervention, was dropped and the king was instead charged with accusations that enabled the conspirators to maintain the traditional view that the kingdom was exempt from the jurisdiction of Rome in temporal matters.

CARTAGENA, ALFONSO DE

Alfonso García de Santa María (*Alphonsus Burgensis*, 1385/6–1456) was the second son of Shlomo ha-Levi, *rab de la corte* of the Jewish *aljama* of Burgos, who on 21 July 1390, before Alfonso had been taught Hebrew, converted to Christianity under the name Pablo de Santa María and was subsequently elected bishop of Cartagena (1402) and Burgos (1415). The Santa María became leading members of the Burgos patriciate, intermarrying with the noble houses of Manrique, Mendoza, Rojas, and others; on being granted a royal patent of nobility in 1440, the family changed its surname to Cartagena. Alfonso García read canon law at Salamanca (ca. 1400–1406) before entering the church and court bureaucracy. By 1415 he was dean of Santiago

de Compostela (dean of Segovia and canon of Burgos, 1420) and judge in the royal *audiencia* of Castile; in 1419, on the majority of Juan II of Castile (1406–1454), he was appointed to the king's council. In 1421–1423 he was sent on the first of several diplomatic missions to the Portuguese court of João I, where in the summer of 1422, at the behest of Prince Duarte, he wrote the “first-born of all my writings,” *Memoriale uirtutum*, a scholastic *compilatio* of Aristotle's *Nicomachean Ethics* with glosses from Aquinas written in rhythmical Latin prose; the prologue to Book II extols the delights of studious solitude, adducing the parallels of Scipio Africanus (Cicero, *De officiis*, III, 1) and Count Fernán González in Pelayo's cave on the banks of the Arlanza, while the *utilogus* illustrates the effects of vice in public life with Tarquin's rape of Lucretia and King Roderick's of La Cava, while virtue is represented by the heroes of the Reconquest.

These *exempla* foreshadow a civic humanist ideal, based on the model of classical Roman culture and virtue but with a significant admixture of native elements, which it became Cartagena's life-long project to preach to the aristocracy. Within months he penned his first Castilian work, a completion of Pero López de Ayala's unfinished translation of Boccaccio, *De casibus illustrium uirorum* (*Caída de príncipes de Juan Bogaçio*, 30 September 1422); this was followed by versions of Cicero's *De senectute* and *De officiis* (*Quatro libros de Tulio*, Montemór o Novo, 10 January 1422 o.s./1423 n.s.), *Pro Marcello* (*Oraçión de Tulio a Julio Çésar*), and *De inuentione*, I (*Rethórica de Marco Tulio Çicerón*, 1425–27), whose prologues make explicit the program for educating knights in “lengua clara vulgar e maternal,” steering a *via media* between the competing claims of classical rhetoric and scholastic philosophy.

Cartagena's next project was a cycle of vernacular translations from the Córdoba Stoic Seneca the Younger which, under the patronage of Juan II, was designed to show the antiquity and worth of Hispanic classical culture in defiance of the Italians (*Gran copilación del alphabeto de algunos dichos de Séneca*, from Fra Luca Manelli's fourteenth-century *Tabulatio et expositio Senecae*, 1428/9–30; *Cinco libros de Séneca*, from *De uita beata*, Ep. ad Lucilium 88, *De providentia*, the apocryphal *De institutis legalibus*, and Seneca the Elder's *Controuersiae*, 1431; *De constantia*; *De clementia*).

It was on a third Portuguese legation in 1427 that Cartagena experienced a first direct contact with Italian humanism, through a pair of Leonardo Bruni's Latin translations from the Greek brought back from Bologna by some Portuguese jurists. The result was his

Declinationes super noua quadam Ethicorum Aristotelis translatione, dedicated to Fernán Díaz de Toledo in 1431, a pamphlet criticizing Bruni's humanist version of Aristotle's *Ethics* as too rhetorical and unphilosophical. The *Declinationes* aroused European controversy when, in 1434, Cartagena took a copy to the General Council of Basel as a member of the Castilian delegation. There he also pronounced a number of public speeches, notably a disputation on *Lex Gallus de postumis instituendis uel exheredandis* (Avignon, 18 July 1434), sermons on the feasts of St. Thomas Aquinas (Juan II's birthday) and All Saints, and political briefs on the powers of the Council and the papal *plenitudo postestatis*, on the preeminence of the crown of Castile over that of England (*Propositio super alteratione preeminentie sedium inter reges Castelle et Anglie*, 14 September 1434), and on the Castilian right to the conquest of the Canaries (*Allegationes super conquesta insularum Canarie contra Portugalenses*, 27 August 1437). The latter are no less interesting for their Ciceronian rhetorical schemes than for their political ideology.

Aeneas Sylvius Piccolomini informs us that Cartagena's oratory so deeply impressed everyone that, when Pablo de Santa María died in 1435, Pope Eugenius IV immediately provided him to the vacant see; his election as bishop of Burgos was confirmed by Juan II's nomination. A further outcome of his stay in Basel was his Latin correspondence with Leonardo Bruni and Pier Candido Decembrio, in which he successfully requested translations from Greek (Porphyry, Homer, and Plato's *Republic*). In March 1438 Cartagena attended the imperial coronation of Albrecht III of Austria in Breslau, where he met Diego de Valera and Pero Tafur. He returned via Prague, Nuremberg, and Mainz, reaching Spain in December 1439, where his first act was to grant a canonry in Burgos to his protégé Rodrigo Sánchez de Arévalo; at the same time the young Alfonso de Palencia entered his retinue. In 1440 he was the chief negotiator in the marriage of Juan II's son Prince Enrique to Blanca of Navarre; it was during the princess's stay in his brother Pedro's palace in Burgos that the Bohemian traveler Rozmital met Cartagena, and it was probably also at this time that the latter formed his close friendships with Pedro Fernández de Velasco (*Epistola ad comitem de Haro*, ca. 1441, a Latin treatise on noble education which again propounds Cartagena's ideal of educated chivalry), with Íñigo López de Mendoza (*Respuesta a la cuestión fecha por el marqués de Santillana*, 1444, on Leonardo Bruni's *De militia*, a discussion of the classical origins of chivalry), and with Diego Gómez de Sandoval, Count of Castrojeriz (*Doctrinal de cavalleros*, ca. 1445, a compendium of laws and commentaries on chivalry). Cartagena formed a deeper friendship with

Fernán Pérez de Guzmán, to whom he dedicated his *Duodenarium*, a set of Latin essays on political, moral, and linguistic questions sent to its addressee (unfinished) soon after 1442.

In the 1440s Cartagena wrote a number of juridical briefs on the rights and constitutions of his bishopric against the pretensions of Alfonso Carrillo, archbishop of Toledo (*Liber Mauricianus, Conflatorium*), and reorganized the cathedral archive; he was also responsible for major building works, including the cathedral's two famous openwork stone spires, designed by Johann von Köln, and the Chapel of the Visitation, which houses his own tomb, and the plaza and episcopal palace of El Sarmental. To these years belong his gloss on a devotional sermon of St. John Chrysostom and *Apologia super psalmum Judica me Deus*, a "contemplación mezclada con oración" on the Penitential Psalm 26, both written in Latin and subsequently translated by the author into Castilian; and the massive *Defensorium unitatis Christianae*, a reasoned impugnation of the anti-converso libels of Pero Sarmiento in the Rebellion of Toledo, addressed to Juan II in 1449, in which, once again, Cartagena brought his vast knowledge of history, theology, and oratory to bear on a subject which other writers had treated only in legal terms. The political situation in the wake of Sarmiento's rebellion was volatile, however, and, after Álvaro de Luna's arrest and imprisonment in his brother Pedro's Burgos palace in March 1453, Cartagena found himself in the invidious position of having to draw up the charges for the execution of the *privado* whose policy he had so loyally supported for twenty years.

Cartagena's last works were the *Oracional* (ca. 1455), a layman's treatise on prayer written in Castilian for Fernán Pérez de Guzmán, which lays stress on the inwardness of spiritual life in ways which point to the *Devotio moderna* and Illuminism rather than Italian humanism, while the Latin *Anacephaleosis regum Hispanie*, on which he was working in the months before his death and which he dedicated to Burgos cathedral chapter, develops the Neo-Gothic myth expounded in his father's *Coplas de las siete edades del mundo* on the Messianic imperial and crusading destiny of Hispania. In the summer 1456 Cartagena undertook a pilgrimage to Santiago for the jubilee, but he was already ill, and had to return before the feast of St. James, dying at Villasandino on 22 July. His decease is recounted in touching terms, with the obligatory deathbed miracle, in the contemporary *De actibus domini Alfonsi de Cartagena* (BNM 7432, fols. 89–92^v, attributed to his amanuensis Juan Sánchez de Nebreda). Other tributes were penned by Fernando de la Torre in a letter to Pedro de Cartagena; by Fernán Pérez de Guzmán in his *Coplas sobre el transito del reverendo padre don*

Alfonso de Cartagena (“Aquel Séneca espiró | a quien yo era Lucilo”); and by his pupil and *camarero* Diego Rodríguez de Almela in a *semblanza* included in a work undertaken at Cartagena’s behest, *Valerio de las estorias escolásticas e de España*, VIII, 6, 9 (completed March 1462, printed Murcia 1487). The most vivid portraits, however, are those by his fellow *conversos* (Catholic converts) Juan de Lucena (*Diálogo moral de vita felici*, 1463) and Fernando del Pulgar, whose *semblanza* shows Cartagena as a man of deep intelligence, pious modesty, and complete integrity (*Claros varones de Castilla*, ca. 1483–1486, published 1486).

CARTAGENA, TERESA DE

Born between 1420 and 1425, Teresa de Cartagena was the author of two important pious prose works, the *Arboleda de los enfermos* (ca. 1450) and the *Admiración operum Dey* (of uncertain date but written out of self-justification to counter the surprise caused by the reception of the *Arboleda*). She was a member of the most illustrious *converso* family of fifteenth-century Castile, the Santa María-Cartagenas, whose members achieved great distinction in literature and the church. She was the granddaughter of Pablo de Santa María, successively the chief rabbi and bishop of Burgos as well as the author of an historical work, *Siete edades del mundo*, the niece of the humanist, statesman, and polemicist Alfonso de Cartagena, also bishop of Burgos, as well as his brother, the intellectual and chronicler Alvar García de Santa María. Teresa also corresponded with Gómez Manrique, one of the principal literary figures of the realm, and was urged

by Manrique to continue her literary endeavors. Teresa lost her hearing at an early age and, educated at Salamanca, she became a Franciscan nun. Her deafness appears to have been instrumental in the development of both her spiritual sensibilities and her literary enterprise.

The *Arboleda de los enfermos* is a consolatory work couched in terms of an allegorical exposition and meditation on the spiritual benefits of illness, specifically her deafness, as a means of isolation from worldly distractions. In it, Teresa distinguishes between the physical and the spiritual ability to hear, concluding that deafness can be a defense against metaphysical blindness. Her aim in writing it was to teach others to cope with adversity. The work is rich with images and demonstrates an intimate spirituality that also places great value on human relationships, especially family. Its sources are complex, largely biblical and Patristic (Augustine, Boethius, Jerome, Gregory the Great, and St. Bernard, among them), and stand as a testimonial to Teresa’s learning and erudition. At the same time, the *Arboleda* is notable for its authenticity and as a record of an intimate religious experience tempered by personal hardship.

The *Admiración*, although derived from largely the same sources as the *Arboleda*, was composed in response to her critics, whom she says disbelieved she could have written the *Arboleda* and chastised her for the audacity of pretending that a woman could have composed such a work. Although the *Admiración* is crafted in a tone framed by obligatory rhetorical modesty, there are at times murmurs of irony in Teresa’s voice as she defends the *Arboleda*’s divine inspiration and fails to give ground on the fact that God may endow women with both strength and intelligence. The *Admiración* is notable because it constitutes an apology for female authorship as well as a series of reflections by Teresa on her own writing and its place in society and in the church.

Although there is no hint of heterodoxy in her works, Teresa’s *converso* origins may have complicated her existence and helped shape the nature of her writing. Both her works were composed shortly after the anti-*converso* riots of 1449 in Toledo and appear to incorporate that experience into her choice of imagery. The traditional Augustinian allegory of the City of God is transformed by Teresa from a secure and ordered place into one of fear, suspicion, and isolation.

The date of her death is unknown.

CARTOGRAPHY

Iberian cartography begins with St. Isidore of Seville who, codifying the knowledge of his day, sought to present a world picture. Isidore sought to explain the Creator's organization of the world by giving a Christian interpretation to the learning of antiquity that complemented the Bible. In order to depict the world created by God and maintained by his providence, he chose the infinite form of a circle, or *Orbis*, a reflection of the divine eternity and perfection of *Terra*—hence the name *Terrarum Orbis*—designated by a *T* within the circle formed by the letter *O*, to produce a tripartite division of the superimposed images. The three parts of the so-called *TO* map corresponds to the Trinity as well as to the tripartite division of the world (Europe, Asia, and Africa) populated by Noah's three sons, Shem, Ham, and Japheth, as described in Genesis 9: 19. The eschatological significance of this synthesis is completed by the similarity of the *T* to the *tau* of the cross of Christ and by the arrangement of the inhabited world around Jerusalem at its center, from which everything stems. This same theocentric, anthropocentric, and geocentric scheme seems to have inspired Western Christian cartography from the seventh century until the end of the thirteenth. Its archetype can be found in the work of the Iberian monk Beatus of Liébana, whose name has come to be applied to designate later versions of the *TO* scheme.

Catalan Portolano. Atlas of Charles V, map of Mecia de-Villadexte, 1413. Copyright © Giraudon/Art Resource, NY. Bibliotheque Nationale, Paris, France.

The regional map, whose mainly maritime use began toward the end of the thirteenth century, contrasts in almost every way with the traditional *TO mappa mundi*. In it, experience, empiricism, and observation prevail over the conceptual and the mystical. These charts are designated "portolan" maps and reveal the extent to which the aim, method, and focus of mapmaking had changed since the time of St. Isidore. Made from sheepskin, calfskin, or other animal skin, the material used is recognizable by its shape, which usually includes skin from the animal's neck. At first sight the image of a portolan map resembles a spider's web, which serves to organize a network of intricate interconnecting lines. Some of these lines (called rhumb lines and arranged in groups of sixteen radiate regularly within tangential circumferences to form compass roses, where their points of intersection with the circumference create sixteen nodal points and mark off sixteen compass divisions, each with a value of twenty-two degrees thirty minutes. Other lines join these nodal points together and make up a series of parallelograms, squares, and rectangles. The vertical lines seem to serve as meridians and the horizontal ones as parallels, yet they do not form a system of graduated coordinates and cannot be relied upon as such. The delineation of coast lines and the location of ports on the charts were made according to triangulation, according to the direction of the winds whose names are given in the vernacular (at first Tuscan) on the map. The use of this form of chart obviously required the ability to take bearings and estimate distances. Thus, portolans presuppose the existence of a corpus of knowledge and calculations vital for accuracy to mariners and cartographers. In order to manufacture and use them, ancient calculations transmitted through the so-called *Tablas toledanas*, replaced later by the *Tablas alfonsíes* of Alfonso X el Sabio, had to be used. At the same time, navigators availed themselves of *portolani*, or books that gave narrative descriptions of coasts and ports, listing the distances between the latter. The oldest and best known example of a portolan chart is the anonymous Italian *Carte pisane* (ca. 1290). Other early surviving examples are also Italian and were made by Petrus Vesconte (1313) and Angelino Dulcert (1325).

Late medieval mapmaking in Iberia is closely linked to political history. The first surviving Iberian portolan charts, for example, are from the so-called Catalan-Mallorcan school of cartography, which Hervé says derived from the Pisan and Genoese schools of mapmaking. The influence of Aragónese commercial expansion and subsequent political hegemony in the Mediterranean from the thirteenth century forward is responsible for this. The uniqueness of the

Mallorcan school's maps is alluded to by Ramón Llull and was doubtless affected by its emergence in Palma's multicultural society of Christians, Arabs, and Jews. Although the Mallorcan cartographers were doubtless influenced by their Italian colleagues, Mallorca became a focal point for the manufacture of charts and for instruction in their making that soon attracted cartographers even from Italy. By the middle of the thirteenth century, the Catalan maps were renowned for their precision, the wealth of their information, and their fine material composition.

The market for sea charts expanded proportionally to the development of navigation and progress in the use of portolans. In 1354, the king of Aragón issued a proclamation forbidding the master of any ship from setting sail without at least two charts on board. This explains not only the presence of many cartographic workshops in Mallorca but also in Barcelona and then later in the fifteenth century at Valencia. The arrangement of the Catalan charts, drawn on roughly dressed skin, conforms generally to the earlier Pisan charts of the Middle Ages. In these, a vertical distance scale is placed on the part of the chart corresponding to the neck of the animal from which the skin is taken. The wind directions are indicated by four medallions whose colors, often red and yellow, point to their Aragónese origins. These charts consist mainly of indications of natural features: rivers and their mouths, capes, bays, towns, and ports surrounded by walls decorated with armorial banners, and often include the delineation of inland mountain ridges and other physical features. Inland seas are represented by waves, and nomenclature is in the vernacular. In addition, certain decorative features mark the various workshops where they originated: the Virgin and Child, the Crucified Christ, St. Christopher, and so on. Mallorcan cartographic skill demonstrated a great deal of technical mastery and a refined artistic sense. The so-called Catalan Atlas, thought to be the work of Abraham Crescas (ca. 1375), is rightly considered the masterpiece of this type of mapmaking.

Few noteworthy Portuguese maps survive from before the beginning of the sixteenth century. From this, however, we should not assume that mapmaking was not an important activity in late medieval Portugal. The need for state secrecy (*sigillo*) may be the reason for their rarity. Portuguese voyages into the Atlantic are well documented from the end of the fourteenth century on, as is the Portuguese craving for maps. In 1428 Dom Pedro, Henry the Navigator's brother, for example, scoured Italy and brought back from Venice a *mappa mundi* whose extension to the Far East proved an incentive for Portuguese voyages and exploration. Henry's collection of cartographic information at Sa-

gres, which he continued to compile throughout his life, is, of course, legendary and well documented as well. Cartography eventually became an official service in the households of the kings of both Portugal and Castile, who sought to attract foreign scholars as their mapmakers and cosmographers. Yehuda Crescas, son of Abraham, most likely worked at Sagres with Henry.

CARVAJAL, JUAN DE

Juan de Carvajal (1399?–1469) was one of the papacy's most important diplomats in the mid-fifteenth century. Born at Trujillo in Extremadura, Carvajal studied law at Salamanca and became dean of Astorga in 1433. By 1438 he had attracted the notice of Pope Eugenius IV, becoming an auditor of the Rota. In 1440 Eugenius sent Carvajal to help sway the Holy Roman Empire from its policy of neutrality in the pope's struggle with the Council of Basel. Continuous labors in Germany between 1440 and 1447 earned Carvajal promotion to the episcopate and then to the cardinalate.

When Nicholas V (Tomasso Parentucelli) succeeded Eugenius in 1447, he dispatched Carvajal to Germany as his legate. The legate, aided by Aeneas Sylvius Piccolomini (later Pius II) won Frederick III, king of the Romans, to the pope's cause. Besides laboring for the dissolution of the Council of Basel, Carvajal promoted political peace between kingdoms threatened by the Turks. After spending the years 1450–1454 in Rome, Carvajal was dispatched to Hungary, where he served as a guardian to the new king, Ladislas Posthumous.

In 1456, as legate for Calixtus III, Carvajal helped save Belgrade from the Turks. The cardinal remained active in Hungary into the reign of Pius II seeing Matthias Corvinus succeed Ladislas. In 1461 Carvajal returned to Rome, becoming cardinal bishop of Porto. He remained active in the curia, serving as legate to Venice (1466–1467) and as chamberlain of the College of Cardinals (1468). Juan de Carvajal died in Rome in 1469 during the reign of Paul II, and he was buried at San Marcello al Corso. His writings were few, most of them being official documents.

CASPE, COMPROMISE OF

The Compromise of Caspe in 1412 settled the four-way contest for the Crown of Aragón that had been left vacant in 1410 when King Martí the Humane died leaving neither a legitimate male heir nor any daughters, and not formally naming a successor. The prize in this dynastic sweepstakes was the prosperous and strategically important Mediterranean kingdom that included not only Aragón, Catalunya, and Valencia on the Iberian Peninsula but also the islands of Sicily, Sardinia, and Corsica.

Four candidates came forward to stake their claims for the crown. Count Jaime of Urgell, son-in-law of King Pedro IV (1336–1387) and great-grandson of Alfonso IV (1327–1336), appeared to have the strongest claim and was favored by influential Catalan nobles. In 1409 Urgell was appointed lieutenant, a position normally reserved for the heir, but he faced fierce opposition by the Aragónese, who feared Catalan dominance. Martí had favored his young grandson Federico, Count of Luna, the recently legitimized son of the late Martí the Younger, but he explicitly refused to come out in favor of Federico. The candidacy of Louis, duke of Calabria, the son of Louis of Anjou and Yolanda of Aragón, was advocated by the influential archbishop of Zaragoza. The fourth claimant, Fernando of Antequera, nephew of King Martí and uncle of Juan II of Castile, was a wealthy and powerful member of the Trastámara family, which had ruled Castile since 1369.

All parties agreed to settle the dispute through general deliberation in parliamentary sessions. The governor of Catalunya summoned the *cortes* (Parliament) to meet in Montblanch on 30 August 1410 but the meeting was moved to Barcelona and delayed until October. Early on, Federico of Luna was eliminated from the contest because his youth and inexperience would have necessitated papal tutelage. In the spring of 1411 Aragónese allies of Jaime of Urgell assassinated archbishop Heredia of Zaragoza because he refused to accept Urgell as a valid claimant. With him died the hopes not only of Louis but also those of Urgell, who, even though not directly connected with the murder was close enough to be seriously discredited. At this point the governor of Aragón threw his support to Fernando of Antequera, recent victor in a major battle against the Muslims of Granada and vigorous supporter of the antipope Benedict XIII as the legitimate pope.

Factional conflicts among the Aragónese and Valencian delegates threatened the meetings of those realms, prompting intervention by Benedict XIII. He proposed the formation of a representative commission composed of nine electors—three each from Aragón, Catalunya, and Valencia. The members of the commission included both the governor and the justicia of Aragón, the bishop of Huesca, the archbishop of Tarragona, and Friar Vicente Ferrer. The sessions met from 29 March to 29 June 1412 at Caspe, a location geographically central to all three realms.

Urgell's claim to the throne through the male line still made him a serious candidate, even though he was tainted by the murder of Heredia. In the end, it was the reluctance of the Catalan electors to declare solidly for Urgell that doomed his chances. By then, Fernando of Antequera, politically savvy and militarily successful, was the candidate viewed by many as the best hope for stability after the two year interregnum, despite Catalan objections to his "foreign" Castilian birth.

The decision in favor of Fernando I, who ruled from 1412 to 1416, was well received in Aragón, less so in Valencia, and not well at all in Catalunya. Nevertheless, the compromise was proof of the strength and vitality of a three-hundred-year-old parliamentary tradition in the Crown of Aragón.

The process by which the compromise was reached is just as important as the fact that the Trastámara family suddenly came to dominate the two most powerful kingdoms on the Iberian Peninsula, Castile and Aragón. At issue was more than just a legal fine point, but instead a political dilemma that forced the nine electors and their advisors to select the man who would make the best king, not simply the man with the best legal claim.

CASTIGOS E DOCUMENTOS PARA BIEN VIVIR

The title of this book does not appear in any manuscript but was so labeled for the library of the Count of Villumbrosa.

Sancho IV, el Bravo (1284–1295), the son of Alfonso X, was, in spite of his nickname (which probably

meant "the Fierce"), a man of excellent education and a patron of literature. This is made manifest by his *Los lucidarios*, a scientific work; by the translation he sponsored titled the *Libro de los tesoros*; by the completion during his reign of the *Primera crónica general*; by his founding of the Estudios generales de Alcalá; and, of course, his most valuable work, *Castigos*, which is the first complete dial of princes in Spanish, even though his father's *Siete Partidas* contains elements of this genre and surely served Sancho as a guide or model to be expanded upon. Sancho, who may have actually composed all or parts of *Castigos* and who certainly oversaw and corrected its composition, if he did not write the book himself, produced one of the most important works of the Spanish Middle Ages and, unfortunately, one of the most neglected to this day. Written in the first person and addressed to his son, to rule as Fernando IV, el Emplazado ("the Summoned" or "the Cited"), (1295–1310), the fifty chapters, some quite lengthy, were finished in 1293, when Fernando was only six. No doubt Sancho believed that as the boy matured he would benefit from the directives addressed to him, all of which set down the obligations a prince, and by extension every man, owed to God, to himself, and mankind. *Castigos*, finished while Alfonso's renaissance was still in flower, utilized many sources, some well known, some rare, and a few never included in any other book: Holy Writ, ancient philosophers, both eastern and western; Cicero; Seneca; stories from the classics, such as those of the Trojan War, and the seduction (by Aeneas) of Dido and her death (drawn from *General estoria*); the *Siete Partidas*; the *Cantigas de Santa Maria*; Peter Lombard; Gregory the Great's *Decretals*; St. the *Disciplina Clericalis*; possibly *Calila e Digna*; the *Boniium*; and the contemporary *Gran conquista de Ultramar*, to list some of the most important. More interesting are stories in which appear characters and places familiar to Sancho, which lend a very personal touch to *Castigos*.

While the style of the book is serious and sedate with a purpose primarily didactic, passages are nevertheless present in which there is obvious recreational intent.

Four manuscripts are extant, as are a few fragments. In the Biblioteca Nacional de Madrid can be found manuscripts A(6559) and B(6603), both of the fifteenth century, and C(3995) of the fourteenth; in the Biblioteca del Escorial can be found manuscript Ez III 4, of the late fourteenth or early fifteenth centuries. Manuscript A contains, in addition to the usual fifty chapters of *Castigos*, some forty chapters of gloss from the *Regimiento de principes* and other sources not al-

ways identifiable. Manuscript C is illuminated by twenty-two exceptionally artistic miniatures, revealing the development of book illustration of that period and the unusual artistic narrative techniques employed to depict events.

Two editions have been published: that of Gayangos, which is frequently reprinted unchanged, based upon manuscript B with additions and substitutions from manuscript A, but never explained or specified; and that of Rey.

CASTILE, COUNTS OF See CASTILE COUNTY KINGDOM

CASTILE, COUNTY AND KINGDOM

Castile, known in Roman times as Bardulia, first emerged as a separate political entity early in the ninth century in the upper reaches of the central Iberian meseta. Many of the early settlers there were mountaineers from the Cantabrian and Basque regions. Centered around the fortress town of Burgos, the *cabeza de Castilla*, Castile, governed by several counts appointed by the kings of León, was a frontier zone exposed to nearly annual raids by the Muslims of the emirate and the caliphate of Córdoba. The name Castile was derived from the numerous castles erected to guard against such incursions. In the tenth century Count Fernán González (923–970) gained control of the entire area and won renown as a champion of Castilian autonomy. In time the office of count became hereditary in his family. The thirteenth-century *Poema de Fernán González* celebrated his victories over the Muslims. At the same time distinctive language forms began to emerge, setting Castilian apart from the Romance tongue spoken in León. Moreover, the Castilians preferred to be ruled by customary law rather than by the *Forum judicum*, the old Visigothic Code that formed the basis of Leonese law.

Castile was transformed from a county into an independent kingdom early in the eleventh century. The dominant political figure at that time was Sancho

the Great of Navarre (1000–1035), who took possession of Castile in 1029 and designated his son Fernando as heir to the county. After his father's death Fernando I (1035–1065) assumed the title of king of Castile and soon seized the kingdom of León as well. As a consequence Castile and León were now joined under the personal rule of one man. However, each kingdom continued to maintain its singular characteristics and at no time were they truly amalgamated into one realm. Before he died Fernando I divided his dominions among his three sons, Sancho II (1065–1072) of Castile, Alfonso VI (1065–1109) of León, and García of Galicia. The latter was soon driven from the Galician throne by his older brothers, but then Sancho II forced Alfonso VI into exile and thereby gained control of his father's entire patrimony. After Sancho II was murdered, perhaps with the complicity of his sister Urraca and his brother, Alfonso VI not only recovered possession of his own kingdom of León but also of Castile. In 1085 Alfonso VI achieved an even more significant advance southward when he seized Toledo on the Tagus River. During this time the Castilian noble Rodrigo Díaz de Vivar, known as the Cid, won fame as a warrior and was extolled as the epitome of Castilian chivalry by the thirteenth-century *Cantar de mio Cid*.

For many years the Duero River valley, which had not been populated by either Muslims or Christians, served as the southern extremity of Castile. Christian settlement there grew apace, however, and extended well south of the river into Extremadura. During the eleventh and twelfth centuries, the kingdom of Castile was organized around great municipal districts, such as Burgos, Valladolid, Palencia, Avila, Segovia, Soria, Logroño, and Santander, each dominating an extensive rural area dotted with tiny villages. *Fueros*, or charters of privileges granted by the king, defined the essential terms of municipal government. The militia forces of these municipalities came to play a significant role in the Reconquest and their mounted warriors (*caballeros villanos*) eventually came to dominate municipal government. The economy was generally agricultural and pastoral. As the frontier was pushed farther south the transhumance of sheep from the northernmost sectors of Castile became more and more prominent and in the thirteenth century led to the organization of the Mesta, a sheep-owners association. Important monastic houses such as Santo Domingo de Silos were established throughout the region. The thirteenth-century priest-poet, Gonzalo de Berceo, commemorated the lives of the saints and helped to forge the Castilian language as a poetic instrument.

The kingdoms of Castile and León were separated by Alfonso VII (1126–1157), who assigned León to his son Fernando II (1157–1188) and Castile to Sancho

III (1157–1158). After the latter's untimely death his young son Alfonso VIII (1158–1214) successfully maintained his independence when his uncle attempted to dominate him and his realm. Alfonso VIII pushed the Castilian frontier well south of the Tagus River toward the Guadiana, although his initial efforts provoked the Almohads, a Muslim sect from Morocco, who inflicted a major defeat on him at Alarcos in 1195. Aided by a papal bull of crusade, Alfonso VIII triumphed over the Almohads at Las Navas de Tolosa in 1212, decisively tipping the balance of power in favor of the Christians. The southern frontier of the kingdom of Castile now extended southward toward the Guadalquivir River, and the road to Andalusia was opened.

After the brief reign of Alfonso VIII's son Enrique I (1214–1217), the Castilians proclaimed his sister Berenguela as queen, but she preferred that her son Fernando III (1217–1252) have the kingship. During his early years the Castilians began to move into the upper zone of the Guadalquivir. In 1230 he succeeded to the kingdom of León and from then on the two realms, while maintaining their different laws and institutions, remained conjoined for the rest of the Middle Ages. With the combined resources of both kingdoms at his disposal Fernando III captured Córdoba (1236), Jaén (1246), and Seville (1248), and reduced the Muslim kingdom of Granada to tributary status. In 1492 Fernando (1479–1516) and Isabel (1474–1504) finally conquered the kingdom of Granada.

Castile was the principal beneficiary of this expansion and always had first place in the royal intitutionation. As the most extensive Christian kingdom in the Iberian Peninsula, Castile had a clear territorial preponderance, but the neighboring kingdoms of Portugal and Aragón through their maritime enterprise tended to enjoy greater prosperity. In the early modern era a geographic distinction between Old and New Castile gradually came into use. The lands north of the Sierra de Guadarrama were known as Old Castile and the former Muslim kingdom of Toledo extending southward to Andalusia and including Madrid, Guadalajara, Cuenca, and Ciudad Real, was called New Castile.

CASTILIAN

Castilian (in Spanish, *castellano*) is a neo-Latin language. Like its Hispano-Romance congeners, Galician-Portuguese, Leonese, Navarro-Aragóñese, and Catalan, it descends in a direct line from the spoken Latin brought to the Iberian Peninsula by the Romans, beginning in the late third century B.C. Its relatively archaic profile has been traced to this early colonization (as against later Romanization of such areas as Gaul and northern Italy).

Though vernacular features are often detectable as “errors” in early medieval Latin documents from Castile, it is customary to trace the origin of Castilian, the ancestor of modern Spanish, to the late tenth or early eleventh centuries, when certain scribes, especially in the monastery of San Millán de la Cogolla (La Rioja), began to insert vernacular glosses of Latin words no longer in spoken use into manuscripts containing religious texts. The so-called *Glosas Emilianenses* (see García Larragueta) also contain the earliest known continuous passage, a religious invocation running to forty-three words, in Castilian vernacular. It was not until almost two centuries later (c. 1200) that authors began intentionally to compose literary works in Castilian. The only surviving version of the great Castilian epic *Cantar de Mio Cid* appears to date from this period (see Smith).

Geography

Spoken at the time of the Muslim conquest in a small area of north/central Spain, specifically the region surrounding—and to the north of—the city of Burgos, Castilian was carried south as a result of the territorial expansion of the Christian kingdoms (traditionally labeled the Reconquest), in which Castilian warriors played the leading role from about the mid-tenth century. By the end of the Middle Ages, it was spoken in an area extending from a thin strip on the Cantabrian Sea in the north to a wide expanse of the Atlantic and Mediterranean coasts in the south (see Lapesa).

Periodization and Dialects

Like any language evolving spontaneously without the constraints imposed by an officially sanctioned prestige norm, Castilian, though confined at the outset of the literary period to a compact territory, exhibited considerable dialect differentiation, with western varieties merging smoothly into Leonese and eastern ones approximating neighboring Navarro-Aragóñese. (Early literary works frequently evince a distinctly western or eastern flavor.) The mid-thirteenth century heralds

a period of intense standardization, with King Alfonso X the Learned, through the activities of scribes and translators of the Royal Scriptorium at Toledo (a city returned to Christian control in 1085) shaping and imposing the Castilian literary standard (see Penny). That official prestige norm was based largely on Toledan usage, with certain nods to more northerly varieties.

Foreign Influences

Though at all times a mainstream member of the Romance family, Castilian has, at different stages of development, been strongly influenced, especially on the lexical level, by other languages with which it has come in contact (see Lapesa and Penny). While the spoken Latin from which Castilian derived had already appropriated many words from Greek as well as Germanic and Celtic languages, Castilian and Galician-Portuguese are unique in having absorbed thousands of Arabic words—mostly nouns belonging to such semantic spheres as agriculture (*berenjena*, “eggplant”), apparel (*alborno*, “burnoose”), building and architecture (*alcoba* “alcove”), law and civic institutions (*alcalde*, “mayor”), mathematics (*cifra*, “zero, figure”), science (*auge*, “apogee”), and war (*adarga*, “leather shield”). Many peninsular toponyms, especially in Andalusia and the Levant, also betray Arabic origins, while others reflect the Arabicization of Latin names, the standard example being *Zaragoza* from *Caesarem Augustum*.

Words of French and Provençal origin percolated into Castilian throughout the Middle Ages. Many designated objects and institutions of feudal culture (*homenaje*, “homage”), but few corners of the Castilian lexicon were impervious to Gallicisms. Among factors promoting such lexical transfer were the presence of French quarters in many Castilian towns; the movement, from the tenth century, of vast numbers of French pilgrims across northern Spain to worship at the shrine of St. James in Compostela (Galicia); and the establishment of prominent French monastic outposts (e.g., Leyre, Sahagún) in northern Spain in the eleventh century.

While early Italianisms were chiefly nautical terms (*mesana*, “mizzenmast”), the closing century of the Middle Ages witnessed large-scale importation of Italian words belonging to many spheres of life, an influx favored in the conquest of Naples by Alfonso V of Aragón in 1443.

The incorporation of classical Latin words into written, then spoken, Castilian, which began at a modest pitch in the twelfth and early thirteenth centuries,

assumed major proportions from the mid-thirteenth century through the end of the medieval period and beyond. These were often words that, having fallen into desuetude in the centuries separating classical Latin from early Castilian, were resuscitated and reincorporated first into the written and then the spoken language by scribes who altered their form slightly to make them compatible with Castilian phonotactics. These *cultismos* thus sidestepped phonetic changes, affecting such lexical material as was passed down from generation to generation through uninterrupted oral transmission.

Finally, a relatively small number of Castilian words came from Basque, among them such frequent personal names as *García*, *Javier*, *Jimeno* (> *Jiménez*), and *Sancho* (> *Sánchez*).

Pronunciation and Orthography

The pronunciation of medieval Castilian differed markedly from that of its modern offspring, Spanish (still often called *castellano* in the Spanish-speaking world). Though vowels have changed little over the centuries, consonants have undergone extensive transformations, some of which were already underway in the Middle Ages, perhaps only as local aberrations from the prestige standard (see Lloyd). Among features that distinguish medieval Castilian from modern Spanish are (1) preservation of a phonemic contrast between /b/ and /v/, the latter sound a labial fricative as in modern French, Portuguese, or, indeed, English; (2) preservation of Latin *F*-, weakened to /h/ then effaced in many varieties, including ultimately the literary standard (Lat. *farina*, “flour” > /*harina*/ > /*arina*/); (3) a full array of sibilants, with *c* followed by *e* or *i* and *ç* = /ts/, *s*- and *-ss* pronounced as in modern Spanish, *x* = /g/ (Eng. sh), *z* = /dz/, *s* between vowels = /z/, and *g* followed by *e* or *i* and *j* = /r/ (the medial consonant of Eng. “pleasure”); (4) *ll*, which in word-initial position often reflected Latin consonant clusters *CL*, *FL*, and *PL*, was invariably pronounced as a palatal /ʎ/, a sound restricted today to parts of northern Spain and the Andes. The *theta* characteristic of modern northern peninsular dialects and the *jota* common to all modern varieties were absent from the medieval phonemic inventory.

Orthography

A major problem for the earliest scribes attempting to write in a Romance language was the Latin alphabet's lack of symbols (i.e., letters) to designate sounds that, while nonexistent in the ancestral tongue, had evolved and achieved frequency in Romance. Experimentation was the order of the day, at least until

Alfonso X the Learned imposed the system that, with periodic modifications, survives in modern Spanish. In addition to orthographic peculiarities described in the preceding paragraph, the reader of early Old Castilian texts should keep the following points in mind: (1) use of *ñ* for palatal /ɲ/ was far from universal; among other solutions tried out and ultimately rejected were *nn*, *ni*, *ng*, and *ny*; (2) *i* and *j*, originally variants of a single Latin letter, were frequently interchangeable; (3) likewise, *u* and *v* were not seen as distinct letters, with *u* often used as a consonant (*auer*, “to have”, *uenir*, “to come”); (4) *lg*, *li*, or *ly* occasionally appear in place of *ll*; (5) *li* and *i* sometimes stand for *j* (i.e., /tʃ/); (6) /*ml*/ is often written *n* before the labial consonants *p* and *b* (*canbiar*, “to change”).

CASTLES See ARCHITECTURE, MILITARY

CASTRO, INÉS DE

The date of Inés de Castro's birth is uncertain. She was born sometime at the beginning of the fourteenth century. Inés was the illegitimate daughter of Pedro Fernández de Castro, Lord of Galicia, and Aldonza Soares de Valladares. The Fernández de Castros were one of the most powerful and influential families in Iberia. Pedro's mother was the illegitimate daughter of Sancho IV el Bravo, King of Castile.

Inés de Castro was brought up at the home of an aunt, Teresa de Alburquerque, near the border with Portugal. Later, she was sent to be educated at the home of her cousin Don Juan Manuel, author of *El conde Lucanor* and one of the most prominent Castilian nobles of his day. In 1340 Inés accompanied Don Juan Manuel's daughter Constanza to Coimbra, where Constanza was to marry Pedro, the crown prince of Portugal. The marriage lasted for five years and produced three children. Constanza died on 13 November 1345. During the years of his marriage to Constanza, Pedro had fallen in love with Inés and had taken her as his mistress. Fearing the union, Afonso IV, the king, had banished Inés from Portugal and she was sent to live

in the castle at Alburquerque. Disobeying his father's orders, Pedro brought Inés back to Portugal after Constanza's death in 1345. They lived together openly in Coimbra. One of the many contradictory accounts says that Pedro and Inés were married at Braganza by the bishop of Guarda in 1354. Although Pedro testified to this marriage in the third year of his reign, there is no documentary evidence of it, which makes it unlikely that it ever took place. Cristovão Rodrigues Acenheiro in his *Cronica dos Reis de Portugal*, citing an investigation of the matter in 1385, denies that the pair was ever married and adds that Pedro told his father that he was not married to Inés and would not marry her. Whether married or not, the union produced three children, who were viewed as a threat to the monarchy and to Portuguese independence. Alvaro Pires de Castro, Inés's brother, had become very influential and his power, along with that of Portugal's rival, the kingdom of Castile and León, threatened the realm if Pedro's successor were a son of Inés.

Pedro's relationship with Inés had become a problem of the state. Afonso IV was aware of the ambitions of the Castros and urged Pedro to proclaim himself a pretender to the crowns of both Castile and León. Three of the king's advisers, Coelho, Alvargonzález, and Pacheco, persuaded the king that Inés and her children should be assassinated to preserve the legitimate succession to the throne. It is said that the king himself went to destroy Inés but was moved by the pleas of her children. Later the king's three advisers persuaded the king that she should be removed and they murdered Inés. Overcome with grief and anger, Pedro led a rebellion against his father. Peace was restored and Pedro promised his father to forgive the murderers. However, when he became king in 1357, Pedro viciously murdered two of them; the third escaped. It is then that Pedro announced that he and Inés had been married and ordered two lavish tombs built at the monastery at Alcobaça depicting Inés's story. He and Inés are buried there. Legend has it that Pedro had Inés exhumed and before placing her remains in the tomb crowned her as queen of Portugal. The powerful story of Inés de Castro and Pedro I has been the object of many works of world literature.

CATALAN GRAND COMPANY

A mercenary soldier-republic gathered by the ex-Templar Roger de Flor on the Arago-Catalan side of the Sicilian Vespers War, at whose end in 1302 it contracted with Byzantium to recover Asia Minor from the Turks. The company's quartermaster/memoirist Ramon Muntaner documents 36 ships, 1,500 horses, and 4,000 *almogavers* or light-armed infantry irregulars from Arago-Catalonia's frontiers with Islam.

A corporation with its own seal, council, and rules, the Catalan Grand Company flew the banners of Arago-Catalonia, Catalan Sicily, and the papacy, as vaguely an overlord or protector. Its brilliantly successful campaigns throughout Asia Minor ended when Byzantine treachery provoked the "Catalan Vengeance"—destructive rampages out of Gallipoli—from 1305 to 1307 and then over Macedonia and Thessally. Aragón-Catalonia, Sicily, France, the Council of Vienne, and the Valois crusade unsuccessfully tried to co-opt them. In 1311 the company conquered Angevin Athens and set up its final state.

Rather than the isolated romantic episode enshrined in Catalan art and letters, the company's stormy passage was an essential part of contemporary Mediterranean diplomacy involving a dozen states, of the decline of Byzantium, of fourteenth-century crusading, and of the rise of effective infantry and of condottiere companies.

CATALAN LANGUAGE

Catalan is the Romance language that developed in the Carolingian counties of the Spanish March. Currently it is spoken in the areas corresponding to the principality of Catalonia, the valleys of Andorra, the French department of Pyrénées-Orientales, eastern Aragón, the majority of the former kingdom of Valencia, the Balearic Islands, and the city of Alghero on the north-west coast of Sardinia. Catalan dialects fall into two groups: Western Catalan, which includes Andorra, eastern Aragón, Lérida province, western Tarragona province, and Valencia; and Eastern Catalan, consisting of North (French) Catalan, Girona and Barcelona provinces, northeastern Tarragona province, the Balearics, and isolated *alguerès*. The boundary between the two groups runs just west of due south from Andorra.

The origins and formation of Catalan were the subject of a long debate featuring several prominent twentieth-century Romanists. A first grouping of Catalan with Provençal in the Gallo-Romance category was supported by Milà i Fontanals, Alcover, Meyer-Lübke, and Bourciez; the use of Provençal as the language of poetry in Catalonia until the fifteenth century was evoked to confirm that identity. That position was modified by Morf and Saroïhandy, who separated Catalan from the southern Gallo-Romance dialects and sketched an east-to-west dialectal blending in Ibero-Romance, from Catalan to Aragóense to Castilian. Diez and Wartburg presented Catalan as an independent language, rejecting the literary relation to Provençal but also denying a place for Catalan in Ibero-Romance based on the judgment that Catalan differs as much from Castilian as Castilian does from Portuguese. Alonso split the knot, fixing Catalan in Ibero-Romance and Provençal in Gallo-Romance. Catalan could not have been Provençal transplanted in the eighth century to Catalonia—specifically the Tarraco-nense province—as Meyer-Lübke had claimed in his book-length study on the question (*Das Katalanische*, 1925). The current taxonomy, offered by Baldinger and confirmed by Badia, is the *llengua pont* theory, which sees Catalan as a bridge language between Ibero- and Gallo-Romance.

The following historical data are relevant to the origins of Catalan: (1) Between 759 and 801 the Franks established the Spanish March, reconquering the French Septimania from the Arabs and entering Catalonia: Girona (785) and Barcelona (801) were liberated, and the region between the Pyrenees and the Llobregat River, currently known as *Catalunya Vella*, was subsequently incorporated into the archdiocese of Narbonne; (2) as Catalonia was consolidating politically, the independent counts of Barcelona, especially those of Ramón Berenguer III and IV, recovered all the current territory of Catalonia in the first half of the twelfth century. Those areas were partially repopulated with Catalan speakers; (3) Jaime I of Aragón conquered Mallorca (1230), Ibiza (1235), and Valencia (1238); his grandson, Alfonso III, conquered Menorca (1287). The island territories were repopulated more completely with Catalan speakers than had been the case on the mainland. Finally, Pedro the Ceremonious evacuated the Sardinians from Alghero (1372) and repopulated that city with Catalan speakers from south of the Llobregat.

Catalan participates in many of sound changes common to Western Romance, for example, the development of a seven tonic vowel system, syncope, lenition, and palatalization. In its atonic vocalism, Catalan

shares with Gallo-Romance the apocope of Latin post-tonic /e/ and /o/, for example, CAELU (*cel*, “sky”), and FORTE (*fort*, “strong”). It develops post-tonic /a/ to /ə/ (Valencian /e/) before a consonant, for example, CASĀS (*cases*, “houses”), PAUSĀS (*poses*, “you [sing.] put”), and PORTANT (*porten*, “they bring”).

A series of changes affecting the mid-front tonic vowels has made the outcome of /ɛ/ and /e/ (in Latin, Ē and Ē) less predictable than in Castilian and Portuguese. The pan-Catalan changes are: (1) /ɛ/—/e/ except before /ð/ in syllable codas (e.g., TĒMPUS, *temps* /tems/ “time”, HĒRBA, *herba* /erba/ “grass”; but PĒDE, */pɛð/, *peu* “foot”; and (2) /e/—/ɛ/ before /l/, /r/ or /nʀ/ (e.g., VĒLA, *vela* /vɛla/ “sail”; VĪRĪDE, *verd* /vɛrd/ “green”; CĪNĒRE, *cendra* /sɛndra/ “ash”. Balearic adds another change, /e/ to /ə/ except as in (2) (e.g., CATĒNA, *cadena* [kəðəna] “chain”, STRĪCTU [əstrət]). On the eastern mainland these are [kəðɛna], [əstrɛt]. Finally, across Catalan dialects a yod /j/ can raise a preceding mid-open vowel (i.e., /ɛ/ and /ə/, two degrees to /i/ and /u/, e.g., FĒRIA, *fira* “fair”; ĒXIT, *ix* “he/she leaves”; FŌLIA, *fulla*; CŌLLIGIT, *cull* “he/she picks.”

The following consonant changes are typical of Catalan: (1) palatalization of initial /l-/ to /ʎ-/ (e.g., LŪNA, *lluna* “moon”; LACU, *llac* “lake”; (2) assimilation and simplification of /-nd-/ , /-nn-/ , /-n-/ (e.g., MANDĀRE, *manar* “to order”; (3) loss of /-n/ in post-vocalic, word-final position (e.g., PĪNU, *pi* “pine” (but pl. *pins*); (4) neutralization of various syllable codas yielding diphthongs that end in velar semivowel [u]: IUGU, *jou* “yoke”; PEDE, *peu*; PUTEU, *pou* “well”; DICIT, *diu* “says”; NOVU, *nou* “new” (but fem. *nova*, NOVA) (Wheeler.).

In nominal morphology, one result of the historical development of post-tonic vowels is that masculine gender is unmarked. If a stem ends in a voiceless occlusive /p t k/, that sound is voiced in the feminine, for example, AMĪCU, AMĪCŌS, AMĪCA, AMĪCĀS: *amic*, *amics*, *amiga*, *amigues* “friend(s)” (msg, mpl, fsg, fpl); ACŪTU, ACŪTA: *agut*, *aguda* “sharp” (msg, fsg).

The Catalan pronoun system is among the more conservative in the Romance family. Each personal pronoun has a tonic subject form (1sg *jo*, 2sg *tu*, *vós*, 3sg *ell*, *ella*, 1pl *nosaltres*, 2pl *vosaltres*, 3pl *ells*, *elles*), an atonic, clitic, object form (1sg *-me*, 2sg *-te*, *-vos*, 3sg *-lo*, *-la*, 1pl *-nos*, 2pl *-vos*, 3pl *-los*, *-les*), and a possessive adjective-pronominal (1sg *meu*, 2sg *teu*, *vostre*, 3sg *seu*, 1pl *nostre*, 2pl *vostre*, 3pl *seu* ~ *llur*). Third person nonreflexive clitics also have distinct indirect object forms (3sg *-li*, 3pl *-los*), and first person singular and third person reflexive-reciprocal clitics

have a separate prepositional object form (1sg *mi*, 3pl refl *si*). Just as Old Catalan 2sg *ti* gave way to *tu* in the modern language, so 1sg *mi* is being abandoned in favor of “subject” pronoun *jo*, which is used obligatorily with prepositions *malgrat* (despite), *llevat* (except), and *ultra* (beyond). There are also sets of contextual variants of the clitic pronouns that originally depended not on whether the elements were proclitic or enclitic to the verb, but rather if they preceded or followed consonants or vowels. Feminine possessives originally matched their Latin etyma, for example, in Old Catalan *mia*, *tua*, *sua*, MEA, TUA, SUA; but were later substituted by *meua teua*, *seua* in Valencia and *meva*, *teva*, *seva* in the principality. *Llur* (ILLÖRUM) has been relegated to literary usage, supplanted by *seu*.

The definite articles coming from ILLU, ILLŌS, ILLA, ILLĀS developed as expected in Old Catalan: *lo*, *los*, *la*, *les*. These forms have been retained generally in western Catalan; elsewhere, *lo*, *los* were replaced with *el*, *els*. Forms deriving from the IPSU series must have been used in Old Catalan and are current in the Balearics and the Costa Brava (*salat* dialect): masc. *es* before consonant, *ets* before vowel; fem. *sa*, *ses*. A third set of definite determiners used with proper names comes from DOMINU, DOMINA; the forms *en*, *na* (both *n'* before vowels) are used commonly in the Balearics, and in official styles elsewhere.

Verbs are organized in three conjugation classes by thematic vowel, for example, gerunds (I) *comprant* “(buying)”, (IIa) *tement* (fearing), and (IIb) *perdent* (losing), (III) *dormint* (sleeping) and (IIIb) *oferint* (offering). Group IIb verbs lack the thematic vowel in the infinitive (*perdre*) and group IIIb shows the infix *-eix-* coming from Latin inchoative *-ISC-* in the present tense (*ofereix*, “he offers”). Historically the thematic vowel from group II extended to I, with a contribution from the group I present subjunctive, for example, pres indic 1pl *comprem* (we buy), *temem* (we fear); past subj 1sg and 3sg *comprés*, *temés* (cf. Sp. *compramos*, *tememos*; *comprase*, *temiese*).

Three other features of verbal morphology are characteristic of Catalan. First, for most of the group IIa verbs, plus *estar* (to be) and *eixir* (to leave), there is a velar consonant on the preterit stem, the 1sg present indicative and throughout the present subjunctive, for example, *deure* (to owe), perf indic 3sg *degué* (in Old Catalan, *dec*), pres indic 1sg *dec* (in Old Catalan, *deig*), pres subj 1sg *degui* (in Old Catalan, *dega*). The velar element is believed to have two sources: in the perfect from the Lat. perfect */-u-/* morpheme (POTUIT, in Old Catalan, *poc*), and in the present from Lat. stem-final */k/* or */g/* (DŪCŌ, *duc*; PLANGŌ, *planc*). Second, the *va-* formative (present of Latin VADERE) is used as a perfect auxiliary in analytical constructions, for ex-

ample, 2sg perf *vas perdre* (you lost); cf. Fr. *tu vas perdre* (you are going to lose); 2sg past subj *vagis perdre*. Finally, an innovative */i/* morpheme appears in the singular and 3pl forms of the present subjunctive, in the plural and 2sg forms of the past subjunctive, and throughout the subjunctive of *va-* and *haver* (to have); for example, for *perdre*, 3pl pres subj *perdin* (in Old Catalan, *perden*); 3pl past subj *perdessin* (in Old Catalan, *perdessen*); 3pl past perf subj *vagin perdre* (Wheeler.).

Two important early documents in Catalan are a version of the *Forum judicum* and the *Homilies d'Organyà*, both from the late twelfth century. Anthologies of medieval Catalan texts include Badia's *Literatura catalana medieval: selecció de textos* (1985), Riquer's *Literatura catalana medieval* (1972), Rubio García's *Documentos lingüísticos catalanes, s. X–XII* (1979), and Russell-Gebbett's *Medieval Catalan Documents* (1965). Concheff has published a *Bibliography of Old Catalan Texts* (1985) for the Hispanic Seminar of Medieval Studies. The major historical dictionaries are Coromines's *Diccionari etimològic i complementari de la llengua catalana* (10 vols., 1980–) and Alcover's cross-dialectal *Diccionari català-valencià-balear* (10 vols., 1927–1962).

CATALINA DE LANCASTER

Reputedly one of the less attractive of medieval Castilian queens, and indeed of a masculine appearance, Catalina or Catherine, born in 1373, was the daughter of John of Gaunt, Duke of Lancaster, and Constance, daughter of Pedro I, the Cruel. As such, her importance to a large extent depended on what she represented in dynastic terms, her marriage to Enrique III of Castile being part of a more wide-ranging settlement of the civil wars that had plagued fourteenth-century Castile, pitting the supporters of Pedro against those of his half

brother, Enrique of Trastámara (Enrique II) and subsequently involving Lancastrian claims to the throne.

But Catalina of Lancaster also played an important political role in her own right. Enrique III had never enjoyed robust health, and when he died in 1406 the heir to the throne, Juan II, was not yet two years old. By the terms of Enrique III's will the regency of the kingdom was to be jointly exercised by his wife, Catalina, and his brother Fernando. These two, however, were never on good terms, and it was decided to divide the regency geographically, the southern half of the kingdom being entrusted to Fernando and the northern half to Catalina. For his part Fernando dedicated his energies to campaigns against the Moors, taking Antequera in 1410, and subsequently being elected to the throne of Aragón by the Compromise of Caspe of 1412.

In the exercise of her share of the regency Catalina was perceived by contemporaries as being of a suspicious nature and possessive yet at the same time easily influenced by favorites, particularly Leonor López de Córdoba, Isabel Torres, and, to a lesser extent, Fernán Alfonso de Robles. After Fernando's death in 1416, Catalina became sole regent of Castile for a brief time before her death in 1418.

CATALONIA

Catalonia coalesced into a distinctive linguistic and cultural region in northeastern Iberia under the pressures of invasion and the violent confrontation between Islam and Christianity. Later its people constituted a cohesive, self-conscious political community centered on the counts of Barcelona. Dominated by inward-looking, protective mountain valleys in the north and an urbanized, Mediterranean coastline to the south, the eastern Pyrenean area lacked a clear geographical unity. Although the balance between mountains and coastal areas was far from stable, the exchange between the two and the interdependence it fostered produced a stable society with a well-defined sense of its own historical identity. Catalonia was in all essentials a creation of the Middle Ages.

Invasion and Continuity (415–801)

The first part of Hispania settled by the Romans, northeastern Iberia, was thoroughly transformed by Latin civilization. Roman institutional and cultural

foundations survived the installation of Germanic rulers, the Visigoths, and Islamic invaders. Both conquering peoples formed only a small minority among the local populations. First crossing the Pyrenees in 415, the Visigoths provided arms to maintain local Roman elites. Concentrated first in Aquitania and later in Castile, the Visigoths lightly governed the eastern Pyrenees and continued Roman administrative practices. King Alaric II issued a breviary of Roman law (506), later reworked into the *Liber iudiciorum*. It remained the basis of public order until the eleventh century.

Arriving in Spain in 711, Muslim raiders reached the Ebro by 714. Visigothic rule rapidly disintegrated. Tolerant masters, the Arab and Berber invaders allowed Christians to retain their churches and clergy in exchange for submission and tribute. Yet some Hispano-Gothic leaders resisted and sought refuge in the Pyrenees. The defensive militancy of the mountain valleys created a tough, cohesive Christian society capable of repelling Muslim advances from the plains. Linguistically the Islamic invasion accelerated the differentiation of Catalan from Aragónese and Castilian as the mountain population turned in upon itself.

The Spanish March (801–950)

The last of the early medieval conquerors, the Franks made the most lasting impression. Charlemagne ordered the campaigns culminating in the capture of Girona (785) and Barcelona (801), but Frankish armies failed to secure the Ebro as they had intended. The check proved decisive for it established a vibrant frontier society. In the Spanish March, the area subject to the Frankish protectorate extending just beyond Barcelona and including the eastern Pyrenees. Islamic influence disappeared; to the west, however, mass conversion produced a thriving Muslim culture centered on Tortosa and Lleida (Lérida). The Christian territory, later known as Old Catalonia bore the imprint of Carolingian order. Eventually divided into fourteen counties, the Spanish March adhered to Visigothic law administered in Carolingian courts. As the Frankish imperium weakened, local counts established hereditary rights to the territory they controlled. Descendants of Guifré the Hairy (r. 870–897) ruled several counties including Barcelona for more than five hundred years. Faced with a threatening frontier, the Pyrenean counties by the end of the early medieval conquests had emerged from the dislocation of the Roman world with a common language, institutions, and traditions. Political independence, dynastic consolidation, and territorial expansion still lay ahead.

Sovereignty and Social Change (950–1150)

Temporarily integrated into a non-Iberian realm by Frankish conquests, the Spanish March was an iso-

lated, conservative region clinging to traditional forms of public order. Local comital dynasties, however, gradually asserted their sovereignty. The sack of Barcelona by the Islamic caudillo al-Manṣūr in 985 made clear that local leaders would have to look after their own needs since the Frankish king failed to heed the appeal of Count Borrell II for aid. To secure the frontier, lay and clerical lords encouraged and protected settlements in deserted regions. Repopulation was above all the work of small, independent freeholders many of whom came from the densely populated mountains. A demographic upsurge began around 950, accompanied by an increase in agricultural production and the creation of local markets. With prosperity came a new aggressiveness and openness. In 950 Count Borrell sent the first embassy to the caliph in Córdoba. Raids were later launched against al-Andalus. The expedition to Córdoba in 1010, involving warlords from throughout Catalonia confirmed the military ascendancy of the Christian north. Through pillage and regular tribute paid by Muslim princes (*parias*), gold, silver, and silks further stimulated an already thriving agricultural economy.

Rapid militarization and a scramble to control new wealth undermined the traditional order based on comital authority, public courts, and Gothic law. Lords with their armed bands built private castles, imposed new obligations on the peasantry, and defied counts and judges. The “feudal crisis” reached its peak during baronial insurrections from 1041 to 1059. Ramón Berenguer I (1035–1076), count of Barcelona, proved the most successful in restoring order, but the basis of power had shifted. Oaths of fealty, contracts of service (*convenientiae*), and castle command buttressed the shaky framework of public authority. The success and prestige attached to the dynasty of Barcelona allowed it to secure several counties in addition to Barcelona, Girona, and Osona. Through marital alliance Count Ramón Berenguer III (1096–1131) acquired Besalú and Vallespir in 1111; in 1117 he annexed Cerdanya, Conflent, and Bergà at the death of Bernat III of Besalú. More land was taken from the Muslims. Upon the arrival of the Almoravids from North Africa in the late eleventh century, Islamic resistance stiffened and the flow of tribute was dammed. A restive baronage turned from raiding to settling the frontier. Tarragona, definitively occupied in 1118, was made an archbishopric. The conquest of Tortosa in 1148 and Lleida in 1149 rounded out the territorial extension known as New Catalonia. A prosperous agrarian society anchored by its many castles, Catalonia remained a land of regional contrast even as its southwestern frontier stabilized. The name Catalonia first appears in an early twelfth-century Pisan work and probably derives from

castellans (*castlàns*), the men who command local cells of power, the castles.

Consolidation and Expansion (1150–1333)

A period of internal stabilization and external expansion succeeded the turbulent transformations of the eleventh and early twelfth centuries. With the western frontier of Catalonia secured, in 1150 Count Ramón Berenguer IV of Barcelona (1131–1162) married Petronilla, heiress to the kingdom of Aragón. The match negotiated in 1137, brought the comital dynasty a crown and even greater ambitions. Alfonso I (1162–1196) and Pere I (1196–1213) aggressively pursued family interests in southern France, but the Albigensian Crusaders thwarted Catalan designs at the Battle of Muret (1213) and left Pere dead on the battlefield. Later count-kings, as Ramón Berenguer IV’s descendants are called, consequently turned toward Iberian and Mediterranean expansion. The remarkable warrior-king Jaime I (1213–1276) conquered Mallorca (1229) and Valencia (1232–1245), his son Pedro II (1276–1285) subjugated Sicily (1282), and his grandson Jaime II (1291–1327) annexed Sardinia (1323). The brilliant phase of Catalan expansion depended on the rapid commercial and naval growth of the towns near the coast especially Barcelona, Tortosa, and Perpignan, and the restive energies of upland barons, knights, and soldiers. Each new conquest was treated as a separate state, but Catalonia remained the dominant member of the federative union known as the Crown of Aragón.

Internally the count-kings extended their control over independent counties and reestablished public order. Alfonso I obtained Roussillon (1172) and Lower Pallars (1192), and Jaime II completed the essential work of political unification with the annexation of Urgell (1314). Through the initiatives of Ramón Berenguer IV, legal experts produced the *Usatges de Barcelona*, a territorial code stressing regalian authority, and local officials called vicars and bailiffs moved toward routinized administration of the aggregate counties. These initiatives culminated in the creation of continuous royal registers by 1257 and a centralized fiscal overseer, the *mestre racional*, by 1283. Towns and villages obtained charters of liberty, fixing their obligations and internal organization. Economic prosperity, political consolidation, and military aggressiveness turned Catalonia into a Mediterranean power of the first rank.

Crisis and Decline (1333–1479)

Under Pedro III the Ceremonious (1336–1387) Catalonia reached the height of its influence, but signs

of strain had already begun to appear. A severe famine struck in 1333, remembered as "the first bad year." The Black Death followed in 1348, taking away 25 to 35 percent of the population. Although mercantile prosperity continued well into the fifteenth century, the economy had been shaken. The vast scale of dynastic ambitions began to erode the fisc. By 1400 many royal assets had been alienated, and the count-kings relied so heavily on the *cortes* (general assemblies) that they lost the financial and political initiative. To obtain a subsidy Pedro ceded judicial supremacy to a deputation of the cortes called the *generalitat*, which evolved into a coordinate administration with the count-king's.

The difficulties of the fourteenth century led to decline by the end of the fifteenth. The lack of a direct male descendant provoked a constitutional crisis, resolved by the Compromise of Caspe (1412) in favor of a related Castilian family, the Trastámaras. The choice of a new dynasty proved a fateful acknowledgment of Castilian ascendancy. The new rulers tended to neglect Catalonia, which fell prey to bitter rivalries between aristocrats and lesser nobles, landlords and serfs, and urban factions. Increasing tensions led to a bitter civil war (1462–1472), accompanied by the revolt of unfree (*remença*) peasants. The war was an economic disaster and confirmed Catalan commercial decline. Before Juan II emerged the victor of the conflict, his son Fernando II had married Isabel of Castile in 1469. When Fernando succeeded his father in 1479, dynastic union brought about Castilian hegemony in Iberia and the eclipse of medieval Catalonia.

CATHOLIC MONARCHS, ISABEL I OF CASTILE AND FERNANDO II OF ARAGÓN

Isabel I, Queen of Castile, known as Isabel la Católica, was born in the town of Madrigal de las Altas Torres,

22 April 1451. She died 26 November 1504, in the castle of La Mota at Medina del Campo (Valladolid). She was the daughter of Juan II, King of Castile, by his second wife, Isabel of Portugal. Only three when her father died, 1451, she was brought up piously by her mother at Arévalo. When she was thirteen, King Enrique IV, her older half-brother, took her and her younger brother, Alfonso, to court on the pretext of completing their education. Enrique's actual motive was to prevent the two royal children from serving as rallying points for the discontented nobles.

When she was already a grown woman Isabel devoted herself to the study of Latin, and became an eager collector of books. She was actively involved in the education of her five children (Isabel, Juan, Juana, María, and Catalina). To educate Prince Juan, she created a school at court similar to the Palatine School of the Carloingians. Her daughters, too, attained high degrees of education. A rather austere individual, Isabel exercised great moral influence on the nobility, discouraging inordinate luxury and vain pastimes. At the same time, she fostered learning not only in the universities and among the nobles but also among women. Some of the latter distinguished themselves through their intellectual attainments—e.g., Beatriz Galindo, called la Latina, Lucía Medrano, and Francisca Nebrija, the Princess Juana and the Princess Catalina (who later became queen of England), Isabel de Vergara, and others who attained proficiency in Latin, mathematics, read philosophy, and became qualified to fill chairs in the universities at Alcalá and Salamanca.

By 1464, when the teenage Isabel had been moved to court by Enrique IV, the Castilian nobility had gained great power by taking advantage of the minorities of succession of the kings Enrique II and Juan II. By the time of the minority of Juan II, they had almost completely stripped the crown of its authority. They availed themselves of Enrique IV's weak character and of the scandalous relations between Juana of Portugal, his second wife, and his favorite, Beltrán de la Cueva. Defeated at Olmedo and deprived of their leader the Infante Alfonso, who was probably poisoned on 5 July 1468, a group of nobles sought the crown for the Infanta Isabel, rejecting the king's presumptive daughter, Juana of Castile, who was called "La Beltraneja" on the supposition that Beltrán was her real father. On this occasion Isabel gave one of the earliest indications of her strength of character and intelligence, refusing the usurped crown offered to her, and declaring that she would never accept the title of queen while her brother lived. The king, on his part, recognized Isabel as his immediate heir, thus excluding Juana. Historians have generally been willing to interpret this act of En-

rique IV as an implicit acknowledgment that Juana was not his daughter. However, even if Juana were his daughter, as she was by juridical presumption, he might have yielded to pressure from the nobles, who sought to give the crown immediately to Isabel. Enrique may thus have compromised with them by making Isabel his heir, as he did at Los Toros de Guisando on 19 September 1468. After the conclusion of the Pact of Los Toros de Guisando, Isabel was at odds with Enrique on account of his plans for her marriage.

As early as 1460 Enrique offered Isabel's hand to Carlos, Prince of Viana, eldest son of Juan II of Aragón and heir to the Kingdom of Navarre. Alienated from Don Carlos, Juan II, however, wished Isabel to marry his younger son, Fernando. Negotiations were protracted until the death of the prince of Viana. In 1465 Enrique made an attempt to arrange marriage between Isabel and Afonso V of Portugal, but the princess had already chosen Fernando of Aragón and was opposed to this alliance. For the same reason she subsequently refused to marry Pedro Girón, master of the Order of Calatrava and brother of Juan Pacheco, the powerful Marqués de Villena. Other aspirants for Isabel's hand were Richard, Duke of Gloucester, brother of Edward IV of England, and the Duke of Guyenne, brother of Louis XI of France. The *cortes* (parliaments) were assembled at Ocaña in 1469 to ratify the Pact of Guisando, when a Portuguese embassy arrived to renew Afonso V's suit for Isabel's hand. When she declined this alliance, Enrique threatened her with imprisonment in the alcázar of Madrid. Although fear of Isabel's partisans among the nobility prevented Enrique from carrying out his threat, he exacted a promise from his sister not to enter into any matrimonial negotiations during his absence in Andalusia. As soon as she was left alone, however, Isabel—with the aid of the archbishop of Toledo, Alfonso Carrillo, and the admiral of Castile, Fadrique Enríquez (the grandfather of her future husband)—fled to Madrigal and then on to Valladolid. From there she sent Gutierre de Cárdenas and Alfonso de Palencia in search of Fernando, who had been legitimized and proclaimed king of Sicily and heir of the Aragónese monarchy after the death of the prince of Viana. After his harrowing journey into Castile disguised as a muleteer, Fernando and Isabel were married in the palace of Juan de Vivero at Valladolid, on 19 October 1469.

Fernando, who shared a great-grandfather with Isabel, was a year younger than his wife. He was born 10 March 1452 at Sos in Aragón and led a peripatetic life from early childhood. He died at Madrigalejo in Extremadura on 23 January 1516. At the age of seventeen, when he married Isabel, he was already king of

Sicily, the hero of two wars, and the father of an illegitimate child. He was raised under the tutelage of Francisco Vidal de Noya, a Latin master, but seems to have preferred the active over the scholarly life, acquiring early on the reputation of a rogue. Fernando's mother was the ambitious Doña Juana Enríquez, of the blood of Castile in collateral line, and like her he seemed very much in control of his destiny.

On 12 December 1474, the day after the death of Enrique IV, Isabel, who was at Segovia, was proclaimed queen of Castile. Doña Juana la Beltraneja had been betrothed to Afonso V of Portugal, and Enrique, revoking the Pact of Guisando, had proclaimed her heir to his dominions. The Archbishop of Toledo, the Marqués de Villena, and other nobles who in her father's lifetime had denied Doña Juana's legitimacy, now defended her claims. The conflict set off a five-year war between Castile and Portugal that ended in 1479, when Doña Juana abandoned her claims, retiring to the monastery of Santa Clara of Coimbra (1480). With this, Isabel's claim to the throne of Castile became unquestioned. Fernando meanwhile succeeded to the throne of Aragón, thus unifying the kingdoms of Castile and Aragón and laying the groundwork for the emergence of the Spanish nation. In the *capitulaciones*, the document governing their powers in the administration of their dominions, the monarchs agreed that they were to hold equal authority, a principle expressed in the motto "Tanto monta, monta tanto—Isabel como Fernando" (One counts as much as the other—Isabel as much as Fernando). On 19 December 1496 Pope Alexander VI, the Valencian nobleman Rodrigo Borja, conferred the title "Catholic Monarchs" upon them, a title that the kings of Spain still bear.

The union of the crowns of Castile and Aragón thus realized, it was necessary to reduce the power of the nobles, who had acquired a position almost independent of the monarchy, rendering government difficult. The monarchs directed their efforts toward various goals: (1) the establishment of the Santa Hermandad (Holy Brotherhood), a kind of permanent police force organized and supported by the municipal councils and intended for the protection of persons and property against the violence of the nobles; (2) improved administration of justice through the organization of tribunals, the establishment of a chancery at Valladolid, and the promulgation of a series of royal edicts known as the Edicts of Montalvo; (3) the abolition of the right to coin money, held by certain individuals, and the regulation of currency laws to facilitate commerce; (4) the revocation of *mercedes*, or extravagant grants, made to certain nobles during the reign of previous monarchs, the demolition of their castles,

which were said to constitute a menace to public peace, and the vesting of the masterships of all the military orders in the crown. To preserve religious unity and orthodoxy, thought to be imperiled by rumors of heresy and Jewish apostasy in Andalusia, the monarchs in 1478 solicited the right to establish an inquisition in Castile from Pope Sixtus IV.

Once their hegemony had been established, the monarchs acted to bring to completion the conquest of Granada, the last Muslim stronghold in Europe, a project that had been at a virtual standstill since the time of Alfonso XI. The Muslim capture of Zahara afforded an occasion for renewing the war, which opened with the conquest of Alhama in March 1482. The Castilians were favored by internal dissension in Granada, which was largely due to quarreling between Emir Muley Hassan and his son Boabdil, and, after the death of the former, to the supporters of Boabdil's uncle 'Abd-allah al Zagal. Fernando and Isabel prosecuted the war in spite of initial serious defeats at Ajarquía and Loja, subsequently taking Coín, Guadix, Almería, Loja, Vélez, Málaga, and Baza. Isabel played a prominent role in the war. Not only did she attend to the government of the kingdom and provide for the support of the army while Fernando was at the front, but she repeatedly visited the field to animate the troops, as during the sieges of Málaga and Baza. A final move to put an end to the hopes of the inhabitants of Granada and solve the logistical problems of the besieging Castilian army was made through the founding of the town of Santa Fe very near the city. As a result, Granada surrendered on 2 January 1492, and the territorial unity of the emerging Spanish monarchy was established. Invoking the need to protect religious purity and the security of the nation, the monarchs issued an edict three months later (31 March), expelling the Jews from Castile, a population estimated to comprise approximately 250,000 people.

At this time, Christopher Columbus, seeking patronage for a voyage of discovery, presented himself to the Catholic sovereigns at Santa Fe. Columbus was introduced to the queen by her confessor, Hernando Talavera, and Cardinal Pedro González de Mendoza. Columbus fitted out three caravels with the means provided by the monarchs and sailed on 3 August 1492 from the port of Palos to land in the Bahama Islands on 12 October. In 1503 the monarchs organized the Secretariate of Indian Affairs, which was the origin of the Supreme Council of the Indies. They were also the patrons of Cardinal Cisneros in his efforts to reform the monasteries of Spain, a work that Cisneros accomplished under the authority of Pope Alexander VI, a gesture that anticipated the reform executed through-

out the entire church. During the 1490s the production of cloths and silk developed at Segovia, Medina, Granada, Valencia, and Toledo, the manufacture of glass and of steel weapons, leather, and silverware, and the wealth imported from the Indies ensured a sound economic footing for Spanish territorial ambitions and the campaigns against the French in Italy. Agriculture prospered as well, while navigation and commerce rose to an unprecedented height as a result of the great wealth from the Americas. The centralized government and stern absolutism of the Catholic Monarchs brought the power of Castile and Aragón to its apogee and augured the nation that would emerge under their grandson, the emperor Charles V, a nation whose influence would span the world and whose supremacy would remain unchallenged for nearly a century.

The Catholic Monarchs' children all suffered unhappy destinies. Prince Juan, the sole male heir, died in his late teens, full of brilliant promise; Catalina was eventually repudiated by her husband Henry VIII of England; Juana, heiress to the kingdom after the death of her brother, married Philip the Fair and lost her reason.

CATTLE RANCHING

In medieval Iberia, as elsewhere in western Europe, the raising of all-purpose cattle for milk, meat, hides, and labor (oxen) in a mixed-crop farming animal husbandry agrosystem was widely disseminated. The bovine component was particularly prominent in the humid crescent lands of the north, extending from Galicia and Portuguese Minho and Tras-os-Montes and on through the Cantabrian valleys and uplands of Asturias, the proto-Reconquest areas of León and Old Castile, and into the western Pyrenees. Well known here is the ancient Asturian practice of driving large numbers of cattle up into summer pastures high in the mountains under guard by "highland cowboys" (*vaqueiros de alzada*). But the English term "cattle ranching", without strict equivalent in Iberian speech, con-

notes the rearing of relatively large numbers of cattle raised outside complementarity with agriculture—primarily for their beef, hides, and tallow. Between 1000 and 1500, as the Reconquest moved south beyond the Duero River and the Central Sierras, Castilian and Portuguese stockmen came to redevelop older and invent new methods and techniques of managing great herds of cows along lines that represent true ranching, the foundations of an industry and a special type of pastoral society important in the Iberian Peninsula and the direct antecedent of the far greater “cattle kingdoms” of Ibero- and Anglo-America.

The medieval sources for this rising new bovine industry include municipal *fueros* and *forais* (privileges), royal privileges and law codes, private charters of various kinds, acts of *concejo* governments where available, constitutional *ordenamientos* of the pastoralists’ associations called *mestas*, and chronicle and literary notices. All of these require supplementation on actual practices and ancient customs that survived in later times in Spain and Ibero-America. Where they are not very helpful, apart from the surprising frequency of color details in early Asturo-Leonese diplomas, is on the cattle breeds basic to the rise of ranching. On the *meseta* (plateau), moving south in later centuries, the distribution is traditional: from the light-colored Gallegas, Minhotas, Tudancas, Asturianas, and Pirenaicas, we encounter differently shaped, differently colored, and above all differently usable species: dark-colored “orucha” around Salamanca, the brown, crimson or dark reds of Extremefias and Berrendas, the white or yellowish Cacerenas, the blacks and reds of Andalusia. And among these often half wild and unruly breeds, descendants of *Bos taurus ibericus*, is the progenitor of the fighting bulls of the plazas already depicted in the *Cantigas* of Alfonso X. How far this distribution reflects Reconquest movements of raiding and settlement is obscure.

On the institutional side data is much more available. In all three customary forms characteristic of medieval Iberian seasonal movement of livestock between lowland winter pastures (*invernaderos*) and high summer grasslands (*agostaderos*) in the sierras—whether within the limits of a single municipality, the more extensive territories made available by intertown compact, or the long drives such as the *mesta* conducted on the royal *cañadas* linking León and Old Castile with Extremadura, New Castile, and Andalusia—the same imperatives imposed themselves. In contrast with small numbers of cattle penned in limited pastures, ranching involved far greater herds moving or grazing on the open ranges of the *meseta*. For this purpose, herdsmen (cowboys, *vaqueros*) were required

now to be on horseback, a necessity eased by the comparative availability of riding mounts to nonnobles in the Castilian kingdom. Armed with the long, pikelike *garrocha*, and assisted by fierce, capable dogs, and possessed of an expertise enabling them to round up or subdue their often resentful charges, these medieval Castilian cowboys, often themselves owners of cows, were the basis of the industry’s successful operation. Whether they knew the lasso, found widely in early America, is obscure; that they were free men, working from San Juan to San Juan for themselves or wealthier stockmen, is certain; and much can be learned from the texts regarding their status as responsible *mayorales* (head shepherds), *rabadanes* (shepherds), or a common hands (*zagales*). The pastoral life for these men turned about the annual cycle of calving, branding, roundups (*rodeos*), and culling for drives to *carnicerías* and other urban markets. All their activities were closely regulated by town laws or those of the *Mesta Real* and other municipal *mestas*, which provided stiff fines for brand frauds, thefts, and general violations of the pastoral provisions of the *fueros* and *ordenamientos de mesta*. On these terms the ranching of cattle was widely pursued in medieval Spain and Portugal, much more than is reflected in the two often-relied-upon accounts and statistics of the modern era. While in most parts cattle ranching was subordinate to sheep ranching, in certain regions by 1500 it seems to have been the dominant pastoral form, specifically in large tracts of Extremadura and Andalusia in Spain and in the Alemtejo (more precisely Ribatejo) countryside of Portugal. Several North American geographers have argued that this essentially Castilian plains cattle system should be recognized as a different type from the one found in the great *marismas* or marshlands of the Gualquivir River delta. The medieval documentation supporting this thesis, however, has yet to be adduced.

One final question—that of access to grazing land by reason of municipal citizenship, royal concession or outright ownership, and of the complex of rents, taxes, and tolls imposed from outside upon bovine ranchers—can only be mentioned. Municipalities offered forage in town commons (*ejidos*) and mountain grasslands; royal concessions of pasture rights in the vast southern expanses of *realengo* (royal lands) were possible; and nobles, military orders, towns, and others exacted rents and other impost. The Late Middle Ages saw in Andalusia the rise of private grazings of some size, the early formation of the later important *estancia* of Ibero-American history.

CAZOLA, TREATY OF

The Treaty of Cazola (20 March 1179) was an alliance between Alfonso VIII of Castile and Alfonso II of Aragón. Both kings pledged mutual aid to each other against all others, especially Sancho VI of Navarre. Alfonso VIII required help to recover the Castilian lands Sancho VI had seized during his minority, and he and Alfonso II had already entered into an alliance for the siege of Cuenca in 1177. The Treaty of Cazola also divided up future conquests in al-Andalus between Castile and Aragón. Aragón was allocated Valencia, Játiva, Biar, Denia, Calpe, Castellón, and the coast of Alicante, while Castile reserved for itself conquests in the rest of al-Andalus. This treaty is generally interpreted as being to the disadvantage of Aragón, but unlike the earlier Treaty of Tudellén (1155) Aragón held its future conquests free and clear, without owing vassalage to Castile for them. Alfonso VIII had already released Alfonso II from the vassalage for Zaragoza that Alfonso VII had imposed upon Ramón Berenguer IV in 1140. The treaty of Cazola thus represented one more step in Alfonso II's attempts to rid himself of Castile's overlordship, and it enabled Alfonso VIII to gain support against the king of Navarre.

CELESTINA

Conceived in the university atmosphere of late-fifteenth-century Salamanca, the initial piece of the *Celestina* puzzle seems to have been an attempt to write a vernacular humanistic comedy with a happy resolution. This anonymous manuscript work fell into the hands of a young jurist, Fernando de Rojas, whose own literary and philosophical leanings resonated with its keen observations of human behavior; from it he fashioned a rather darker meditation on the failings of human love unaccompanied by higher values. This new work first saw print in Burgos, probably in 1499, and was titled *Comedia de Calisto y Melibea*. It contains the original piece—as a first act—and fifteen

additional acts, all through a series of unmediated dialogues that are among the many formal excellences of the work.

It relates the passion of a young nobleman (Calisto) for the daughter (Melibea) of a wealthy entrepreneur (Pleberio) and his wife (Alisa). When in the work's opening scene Melibea summarily rejects Calisto, he seeks the solitude of his bedchamber to bemoan his cruel fate. When a servant, Sempronio, learns the true cause of this odd behavior, he seeks personally to benefit by enlisting the aid of a penurious go-between, Celestina, whose house of prostitution he frequents in order to visit his partner, Elicia. Celestina is also known to another of Calisto's servants, the younger Pármene, whose mother (Claudina) was Celestina's mentor and who, on her death, left her young son in the bawd's care. Pármene takes a strong negative tack with his master, attempting—unsuccessfully—to dissuade him from involving Celestina in the pursuit of Melibea. Calisto's treatment of Pármene's well-intentioned admonitions opens avenues in which both Celestina and Sempronio are able to co-opt his loyalties.

What ensues is the entanglement of human emotions, the forming of alliances, and the betrayal of relationships, and in all this Celestina proves to be a masterful manipulator. Her superiority is bolstered by a rhetorical advantage obtained in long years of trafficking in clandestine love affairs, and an ironic, experienced eye for the profitability in the exploitation of others' weaknesses. It is through her that we come to focus on human frailty: we are able to see Calisto as a parody of the noble lover, Melibea, outwardly resisting, but all-too-willing to enter into a secret game of her own, and the servants and other members of the underclass as eagerly disloyal participants in a social fabric weakened by a lack of moral underpinnings. As Melibea prepares to indulge her newborn passion under the cover of darkness, and Calisto to violate the sanctity of Pleberio's home, Celestina is prevented from exulting in her professional triumphs or the spoils they bring her. Sempronio and Pármene, having newly forged an alliance through shared cowardice, violently murder her over her refusal to keep their agreement to share all the profits and, moments later, are themselves executed for the crime. Subsequently, Calisto, in rushing from his initial tryst with Melibea, to aid another pair of servants, slips on the ladder that gave him access to her walled garden and falls to his death. Melibea, all her illusions and future thus dashed, makes a confession, from the turret of the house to a bewildered Pleberio below, and then leaps to her death in a willful suicide, a perverse imitation of Calisto's own fall. Pleberio, bereft of his only daughter and heir, is left

to ponder the harsh world, in which cruel fortune and deceitful (carnal) love leave only chaos in their wake. The ensuing silence as the text ends is complete.

Not long after the three known printings of the *Comedia* appeared (1499–1501), Rojas was prevailed upon by readers to again take up his pen for the purpose of extending the lovers' tryst. The expanded version includes—grafted onto act 14 of the *Comedia*—the month of lovers' meetings but also a new subplot in which the surviving girlfriends of Sempronio and Pármene devise a plan to avenge these deaths by conspiring with the ruffian, Centurio, to murder Calisto. This twenty-one-act version, the *Tragicomedia de Calisto y Melibea*, was almost immediately translated into Italian (1506); the expanded version is today better known as *Celestina*, a reflection of her crucial multiple roles in the plotting and unfolding of the action and in exposing the moral vacuum at its center. *Celestina* became very popular and continued to be popular well into the seventeenth century, with some eighty editions by 1634. It was also translated into German (1520, 1534), French (1527, 1578), English (c. 1530, 1598, 1631, 1707), Dutch (1550), Hebrew (mid-sixteenth century, no longer extant), and Latin (1624). In Spain, *Celestina* was revived in sequels (*Segunda Celestina*, *Tercera Celestina*) and imitated by other bawds in many works in prose (*Tragedia Policiana*, *Lisandro y Roselia*, *La Dorotea*) and dramatic works by, among others, Juan del Encina, Torres Naharro, and Lope de Vega. As early as 1510 a ballad circulated, with the work rendered into octosyllabic verse. In 1513 an eclogue by Pedro Manuel Ximénez de Urrea may possibly have been staged.

None of these works replicates the powerful literary language, probing insights into character, or social and moral vision that Rojas's *Celestina* possesses. Careful scholarship has revealed the debt Rojas contracted with previous authors (Terence, Petrarch, Seneca, Diego de San Pedro's *Cárcel de Amor*, etc.), has shown how the philosophical teachings in the Salamanca of his day are present in the work, and has brought to light how the text deals with the contemporary social issues of the early sixteenth century (the emerging bourgeoisie and the urbanization of the cities, the decay of and innovation in religious matters, the handling of public morality, and the like). It has shed light on the ways Rojas is both traditional (in his use of rhetorical models, for example) and highly original (in his development of fully three-dimensional characters who reveal themselves in pure dialogue). *Celestina*'s pessimism has been explored, as have its hedonism, its vitality, its ironies, its genre (dramatic or novelistic?), and its complicated textual history. As

well, its presentation of magic, its celebration of the present, its confrontation with carnality, its existential nature, its didactic frame and its dialogue with readers have each been extensively scrutinized.

Celestina's continuing appeal, five hundred years after its first appearance, is evident in new editions, translations, adaptations (the theatrical stage, the operatic stage, ballet, film, and novelization) and its ongoing appeal to artists (Francisco de Goya and Pablo Picasso among them). Today *celestina* is a noun, *celestinear* a verb, and *celestinesca* an adjective in the Spanish language. And *Celestina* is considered to be Spain's second masterpiece, preceded only by Miguel de Cervantes's *Don Quijote*.

CHANCERIES

The history of the writing offices of the Christian rulers of medieval Iberia has not been adequately studied. While the oldest charters date to the eighth century it is impossible to speak of a royal chancery, in the sense of a department of government hierarchically ordered, before the reign of Alfonso VI of León-Castile (1076–1109) or perhaps even of his daughter, Urraca (1109–1126), where the first such appeared on the Iberian Peninsula. Earlier documents were written by individual scribes who usually styled themselves royal notary or royal clerk.

The title of chancellor for the head of the royal writing office was used very sporadically under Queen Urraca but became regular under her son and successor, Alfonso VII (1126–1157). In Portugal the chancery was organized and the chancellorship appeared

late in the reign of Afonso Henriques I (1128–1185). The title did not come into use in the kingdom of Aragón until the reign of Jaime I (1213–1276), delayed possibly because of the maintenance of separate writing offices for Aragón and for Catalunya even after the effectual combination of the two realms subsequent to 1137 during the reign of Ramón Berenguer IV (1131–1162).

The language of the chancery documents was Latin until the reign of Alfonso X (1252–1284) in Castile, then Castilian began to be employed, though Latin was still the language of international correspondence. In Portugal the vernacular replaced the classical language slightly later, in the time of King Dinis (1279–1325). Again, in the kingdom of Aragón the practical difficulties of a multitude of vernaculars militated to maintain Latin as the official language until well into the fourteenth century. The script of the documents was the peninsular Visigothic hand until the twelfth century when it was replaced everywhere by the Caroline, of French derivation. Subsequently Iberian script followed the general European development of the Caroline.

Dated documents followed the classical style of kalends, nones, and ides for the day and month until the modern method was introduced in the thirteenth century. At this time, Portugal, Castile, Aragón, and Navarre converted from the use of the "Iberian Era" calendar to use of the Christian Era calendar, thus setting back the chronology by thirty-eight years. Dating practice in Catalunya had rather followed the regnal year of the kings of France until 1180, when the use of the Christian Era calendar was adopted. The medium of the documents was parchment until the conquest of Muslim Játiva in 1244 by Jaime I of Aragón made paper more generally available; it became the standard everywhere for all but the most solemn documents by the middle of the fourteenth century.

Types of documents produced by the princely chanceries fall into four main categories prior to 1300. The most familiar and numerous of these is the charter, precisely because it ordinarily was the instrument for the conveyance of land and, subsequently functioning as title to real property, had a permanent value to the possessor. Probably during the course of the twelfth century the *fuero*, or grant of legal privilege to a town or village, became a gradually distinct type of document. The precise evolution is difficult to trace since *fueros* were subsequently emended and enlarged and their original documents seldom survived.

Both of these documentary genres were, in all likelihood, far outnumbered originally by the mandate. This was simply a royal order for obedience to or the accomplishment of a specific royal enactment or deci-

sion. One or more of these mandates probably accompanied each *fuero* and charter and alerted the persons affected to their new status or of a new superior. This ordinarily basic administrative and secondary character of the mandate made its preservation strictly haphazard. For the kingdom of León-Castile in the eleventh and twelfth centuries, for example, the known charters number more than two thousand but known mandates less than fifty.

Royal letters are quite poorly preserved in number for much the same reason. Their importance even to the principals vanished very quickly with the passage of time. Some survive in national archives but subsequent officialdom found them difficult to classify, particularly because they, like the mandate, were originally undated. Some of the more fortunate examples survive because of their incorporation into histories or chronicles.

Survival of the originals is crucial because the practice of copying a duplicate into a permanent official register was followed regularly nowhere in the Christian realms of the peninsula before the mid-thirteenth century. The earliest preserved series of such registers derive from the Kingdom of Aragón, starting about 1250.

Princes, prelates, and great nobles also developed chanceries, using the term in its broadest sense. That is, they sometimes came, at least by the late eleventh century, to boast an official called a notary rather than relying on a public notary of some sort. But the character of even such important persons was more particular and limited than that of the crown, of course, and the smaller volume of their official output of documents made the development of a true department infrequent. For the twelfth century a long series of charters exists of the Catalan counts of Urgell, but they seem to have been written mostly by their chaplain. For 1156 charters authorized by the Castilian Lara count, Manrique, exist and were written by the count's "chancellor" but there is no evidence that this person had subordinates. Archbishops and bishops more often had an official known as chancellor, for the latter title seems to have been intimately related to the appearance of cathedral chapters in the peninsula in the early twelfth century. But evidence for the appearance of an episcopal chancery, precisely as a department, must be investigated separately in every case.

CHANCERY, LEÓN-CASTILE

While the chancery is the first of the offices of royal government to take shape, to speak of a chancery in León-Castile before the end of the eleventh century is misleading. As best we can tell, before that time the work of preparing the king's documents was entrusted to one or more scribes or notaries, presumably clerics. The documents are written on parchment, and the script is Visigothic. From the reign of Alfonso VI (1065–1109) the style and usage of the chancery become more regular. The documents it issues are charters, usually conveyances of property, mandates, or expressions of the royal will about some matter, and the *agnitio*, or record of a judicial decision. Some features of Caroline script are noticeable.

During the reign of Urraca (1109–1126) this characteristic becomes more pronounced and the title "chancellor" is occasionally employed. It is during the reign of her son, Alfonso VII (1126–1157) that the use of Caroline script becomes invariable until that script itself evolves into the Gothic after the mid-thirteenth century. Roughly nine hundred royal documents survive from Alfonso's reign. They depict the final adoption of the chancellor's title for the head of the royal writing office and a true department in which the ranks of scribe, notary, and chancellor are usual. The royal seal that appears on the documents is still ordinarily the drawn *signum*, but there is some disputable evidence for the utilization by Alfonso of a pendant seal as well.

In the separate chanceries of León and Castile after 1157 the *signum* continues to be employed but it has become the *rota*, or round design deriving from the papal design. It is also now supplemented by the use of a pendant seal. In the kingdom of León the title of chancellor has passed, of right, to the current archbishop of Santiago de Compostela while, in the kingdom of Castile, the archbishop of Toledo seems to have acquired something of the same prerogative but the title is less clear. However, the work of the chancery had become sufficiently demanding and professionalized so that the actual function was performed

by a delegate in the case of León and perhaps also in Castile. Only after the unification of the two kingdoms under the aegis of Castile will the chancery adopt paper, the vernacular, and the Gothic script.

CHARLEMAGNE

Charlemagne (Charles the Great), king of the Franks (768–814) and first of the Carolingian emperors (crowned 25 December 800), was interested in Spanish affairs throughout his reign, but enjoyed only limited success in his attempts to extend his influence into the Iberian Peninsula. In 777 he was persuaded by envoys sent from Zaragoza to launch an expedition into the Ebro River valley the following year. This was an area that earlier Frankish kings had coveted, and the threat of the northward extension of the newly developed power of the first Umayyad Amir of Córdoba made the local Arab and *muwallad* rulers in the valley initially anxious to cooperate with Charlemagne. In 778 one column of his army took Pamplona, while the other made its way around the eastern end of the Pyrenees. However, Charles's local allies deserted him, and both Barcelona and Zaragoza were held against the Franks. In the ensuing retreat across the mountains his rear guard was ambushed and destroyed by the Basques in the pass of Roncesvalles. Among other prominent members of the Frankish court killed there was Roland, the count of the Breton March, and from this episode developed the eleventh-century poetic epic *Chanson de Roland*. Its relationship to the historical realities of the battle is almost nonexistent. During his disastrous expedition the Saxons had revolted against Charlemagne, and he never led a Frankish army in person across the Pyrenees again. However, the Franks were able to make themselves masters of Girona in 785 with local support, and in 797 diplomatic contacts with the Asturian kingdom may have been part of an intended large-scale Frankish intervention in Spain. Huesca was then occupied, but another Saxon revolt seems to have led to the cancellation of any more extensive plans. In 801 the delayed offensive was resumed, and an army under Charlemagne's son Louis, King of Aquitaine (781–814) captured Barcelona. Between 801 and 810 Louis made various attempts to press farther south and take Tarragona and Tortosa, but these attempts were

unsuccessful. A frontier was established roughly along the line of the Llobregat River. On the basis of these conquests a Frankish March was established, with its center in Barcelona. During Charlemagne's interventions in Spain a number of indigenous Christians entered his service. The most significant of these was Theodulf (778–821), who later became bishop of Orleans, and who was one of the emperor's closest ecclesiastical advisers. Spanish influences have been detected in the chapel he built at Germigny-des-Prés and in his theological writings, including the *Libri Carolini*.

CHILDHOOD

Children appear frequently in Iberian literature, gain-saying twentieth-century ethnocentric assertions of medieval indifference to children and childhood. Seldom portrayed realistically, children are incarnations of certain topics: human innocence, the consequences of illicit sexuality, and potential greatness.

Innocent babies were abandoned: Isomberta's seven infants whimpered softly like a nest of animals in the *Gran conquista de Ultramar*. Unlike Tarsiana, of the *Libro de Apolonio* whose foster parents were chosen by her father, the tiny Amadís, protagonist of *Amadís de Gaula*, was set adrift. His designation *sin tiempo* (age unknown) might allude to the juridical status of an unbaptized infant less than twenty-four-hours old or of a child below the age of seven. Other innocent children were put at risk: "El niño judío" in Gonzalo de Berceo's *Milagros de Nuestra Señora*, and the *Cantigas de Santa María*; a little boy swept out to sea in Sánchez de Vercial's *Libro de los enxemplos*; a nine-year-old girl sent to confront the angry Cid by the frightened citizens of Burgos in the *Poema de Mío Cid*.

Evidence of parental sexuality, the children were disposed of (Amadís, Esplandián, and Florestán and the ballads *El hijo vengador* and *La infanta parida*). Multiple births were evidence of multiple sexual encounters as in the *Romance de Espinelo*, and Isomberta's brood in the *Gran conquista de Ultramar*. The

fruits of incest were deformed either physically (Endriago in *Amadís de Gaula*) or spiritually (García in *La leyenda del Abad don Juan de Montemayor*).

Lost children found protection of either humans or beasts. During a peaceful family picnic little Garfín was carried off by a lioness in the *Libro del cavaillero Zifar*, and later his younger brother Roboán strayed from his parents' lodgings. Chance reunited them later in the care of a kindly family.

Some childish precocity prefigured future achievements, as in the *Libro de Alexandre* and the *Mocedades de Rodrigo*, or of a natural inclination: young Amadís's spirited defense of his little brother, or the piety of Santo Domingo de Silos and San Millán de la Cogolla in Berceo's accounts.

Books of instruction list the stages of childhood: *infancia* (birth to age seven), *mocedad* (ages seven to fourteen), and *adolescencia* o *mancebía* (ages fourteen to twenty eight). Rules for the care of children under seven dictated that they were to be fed milk or bland and tender foods; they were not to be given wine; they were to become accustomed to the cold; they were to take exercise; they were to be entertained by suitable tales and songs; they were not to cry because the soul escapes during sobs, and sobs were not to be stifled for fear that they become ill (*Glosa castellana al regimiento de príncipes*). Some royal children were sequestered to ward off their predicted destiny as in the *Sendébar*, *Barlaam e Josafat*, and *Libro de buen amor*. Finally many medieval Iberian folktales urge early moral training.

CHIVALRY

Chivalry, or *caballería*, had many connotations within the political, cultural, and juridical framework of the Christian Middle Ages in the Iberian Peninsula. In the first place, it alluded to an institution that functioned as a nucleus for the defense of the borders of the realm, composed principally of groups of citizens and military professionals at the service of the king, the towns, the councils, and other entities that exercised political power. Over time, along with the pacification of the frontiers, individuals who practiced chivalry became established as local powers in the cities. They were

constituted as groups of mounted military men referred to as the *caballería villana*, whose activities during peacetime were related to the guilds, the professions, and the working of the land. Through their ability to rehearse local power and influence, a strong sense of solidarity developed between the members of these groups in relation to the monarchy, which from time to time obliged them to display their skill at arms and horsemanship and to exhibit the authority of the crown through the array of the insignia that had been conferred upon them by the king. Additionally, they sought to define and consolidate their own power by organizing themselves in associations, chapters, or brotherhoods (e.g., el Cabildo de Caballeros Guisados de Caballo de Cuenca, la Cofradía de Caballeros de Santiago de Burgos, los Caballeros de Alarde de Jaén, etc.) that not only pursued royal sanction in order to make use of their power in the cities but also aspired to a rank that would confer social distinction on particular members. Both clerical and aristocratic authors during the Middle Ages refer to these individuals as *defensores non nobles* (Juan Manuel) or *omnes de caualllo* (Alonso de Cartagena) to distinguish them from a completely different manifestation of chivalry that reflected an *ordo* or estate.

The origin of chivalry as an estate, or *ordo*, in Castile may be traced to a specific chronological moment, when it was defined for the first time in Alfonso X el Sabio's (1251–1282) *Segunda Partida*. Chivalry in that context became an expression of the monarchy's desire to create a loyal aristocratic institution that could exist as an expression of solidarity with the crown and would recognize the latter's political and juridical supremacy. This institution—in both ethical and cultural terms—was essentially lay in nature. It was centered on the observance of what may perhaps have been its greatest interest: the strict affirmation of centralized monarchical power and the constitution of chivalry itself as a means toward achieving the highest expression of individual personal power, independent of lineage, through the practice of virtue. It is this last aspect that distinguishes the historical expression of chivalry in Castile from elsewhere in medieval Europe and marks, at the same time, both the public aspirations and critiques of the institution from the time of its first expression in the *Partidas* until the end of the fifteenth century.

Chivalry in late medieval Castile rests on a set of intertwined social beliefs and dependencies that comprise a *récit*, or narrative, that for the sake of discussion may be called the “chivalric fable,” which in all of Europe, but especially in England and France, was tied to the development of the monarchy during the second half of the twelfth century. The chivalric fable em-

braced the public expression of a widely held aspiration: literary, and later political and legal, texts transmit the belief that the nature of humankind is not predetermined by its pedigree or ancestry, but rather by individual virtue, which has the power to alter radically all social destinies. In this scheme, the means for revealing individual virtue was principally through the exercise of chivalry. Fictional works like the *Libro del cavallero Zifar* and *Amadís de Gaula* reiterate the irrelevance of the chivalric hero's lineage, who must eschew family origins in order to prove his value in the world. Zifar, who labors under an ancestral curse, seeks to free himself from his origins; and Amadís, the son of a king and a princess, is cast to chance at birth upon the waters in a Moses basket. In both cases, each is obliged to remain blind to high-born privilege in order to earn through the personal exercise of arms and virtue society's highest ambitions. This central idea of the chivalric fable is also expressed in the juridical and political spheres of late medieval polity. The civic aspirations and personal statecraft of Alfonso X, for example, rested precisely upon the definition and propagation of a politics based on the interdependence of chivalry and monarchy. It is thus important to note that chivalry as a juridical institution was not driven merely by the higher social aspirations of the lower nobility but also by the centralizing political objectives of the monarchy. In this way, chivalry constituted a discourse of power that expressed a sense of unity between the crown and certain sectors of the nobility in the creation of the state whose ruling class was endowed with authority by the king through ritual investiture and, consequently, remained under his control.

Without the independent ability to interfere in the political and jurisdictional affairs of the kingdom, chivalry was thus a tool of monarchy used to counter the privileges and claims of the high nobility, whose interests were tied to the land, often at odds with the crown's, and were essentially feudal. The attempt to forge an alliance between the monarchy and the lower nobility was immediately recognized by the high nobility for what it was, a usurpation of their ancient territorial prerogatives. As in the case of Don Juan Manuel, the high nobility was obliged to accept the culture of chivalry and its forms of expression, but not the submission to the centralized political objectives of the monarchy that it implied. In contrast to the policies of Alfonso XI and the Orden de la Banda (a lay chivalric order that sought to constitute a political and administrative entity based on a deterritorialized notion of nobility), Don Juan Manuel proposed in many of his works a completely different hierarchy of power that made the institution of chivalry an honor pertaining to all noble men who were considered by him to

be the real stalwarts of social, political, and juridical order, independent of their hereditary titles.

The duality espoused by Juan Manuel became the crux of a debate on chivalry that developed in Castile during the latter half of the late Middle Ages, particularly during the fifteenth century. By then, chivalry had acquired a well-defined legal status, which helped to radicalize the positions taken in the debate. Following the precedents set by the Italian jurist Bartolo de Sassoferrato, the Trastámaran monarchs of the fifteenth century established the possibility that chivalry could be defined as a noble distinction and thus confer nobility upon all those who were invested in it, even individuals of nonnoble origin. The effects of chivalry were thus extended and opened and aspiration to it became more widely public since it offered everyone the possibility of elevation to noble rank, but especially to the members of the so-called *caballería villana*. Many among the high nobility, of course, abjured emphatically the notion that chivalric investiture denoted the conferral of noble status, and rejected even more strenuously the idea that the crown could create nobles from plebes by means of investiture in, or certification of, chivalric estate. On the other hand, some *caballeros* of noble lineage, especially those nobles of *converso* (Christian convert) origin like Diego de Valera, defended the royal prerogative to confer nobility through chivalric investiture. For Valera this faculty constituted the highest expression of the crown's authority in the exercise of its power since it allowed the king to control, create, and define the nature of nobility *ex nihilo*, and thus to rule unquestionably the juridical and political life of the realm.

THE CHURCH

One medieval tradition credited to St. Paul was the bringing of Christianity to Spain. It was based on the apostle's Epistle to the Romans, in which he told the Christians that, having finished his evangelization in the eastern Mediterranean, he intended first to visit them and then proceed to spread the word in Spain. (Rom. 15: 19, 28–29). There is no evidence, though, that such a visit ever took place. Equally spurious were

later claims that it was one of Jesus's original disciples, St. James the Great, son of Zebedee, who brought the Gospel to Spain. This James, who was beheaded on the orders of Herod Agrippa in A.D. 44, seems never to have left Jerusalem. (Acts 12: 2) Nevertheless, a tradition developed in Spain in the seventh century that he had in fact been the first Christian evangelist there and, from the ninth century onward, it was claimed that James's body had been transported to Santiago de Compostela, in Galicia. In reality the earliest surviving information concerning the organization of the Spanish church is to be found in a letter of St. Cyprian (bishop of Carthage in North Africa, ca. 200–258), dated 254. There seems to be little doubt, though, that Christianity had, in some form, existed in the peninsula since the early days of the Church, as a result of the integration of Hispania into the Roman Empire. Testimony to its importance in the Spanish provinces is to be found in the martyrdoms that took place during the reign of Emperor Diocletian (245–313). Many of the Spanish martyrs of this period entered Christian tradition through the verse of the Latin poet and hymn-writer Prudentius (346–ca. 410) in his collection *Peristephanum*. At Elvira (later Granada) around 306, a council of the Spanish Church passed eighty-one canons, including severe disciplinary measures against apostates (to paganism or Judaism) and adulterers. Canon 33 ordered clerical continence on pain of removal from office, while many of the Elvira canons demanded life-long excommunication of offenders, without the prospect of reconciliation to the Church even at death. Such official harshness was to be characteristic of the Spanish church during the centuries that followed the Roman withdrawal from the peninsula. During the fourth century, Hosius, bishop of Córdoba (ca. 256–357/8), and Gregory, bishop of Elvira (d. after 362), became active in the defense of Catholicism against the heresy known as Arianism. Hosius suffered persecution in Córdoba, took part in the Council of Elvira (ca. 306), and most famously, as adviser to Emperor Constantine, took a lead in the Council of Nicea in 325, which defined Catholic orthodoxy in the form of the "Nicene" creed, while Gregory urged harsh measures against Arianism at the Council of Ariminum (359). While Hosius and Gregory were defending orthodoxy on the international stage, a Hispano-Roman senator, Priscillian (d. 386), became bishop of Ávila and lost his life, supposedly for undermining clerical authority, encouraging even more severe ascetic practices than were currently orthodox, and allowing too great a public role in the Church to women.

During the fifth century, most of the peninsula fell under the rule of the Visigoths, who espoused the

version of Christianity that became associated with the name of Arius (d. 336), in which, according to the Alexandrian's "Catholic" opponents, the humanity of Jesus, rather than his divinity, was held to be his dominant characteristic. It is not clear why the Visigoths adopted this fairly abstruse divergence from Catholicism, but Arianism remained a feature of the Visigothic Church until King Reccared (r. 586–601) announced his conversion at the third (Catholic) Council of Toledo in 589. Reccared, who since 573 had shared government with his Arian father, Leovigild, was probably converted by St. Leander, bishop of Seville, and the sometimes violent resistance of the Arians was quite soon repressed. Reccared was praised by St. Isidore of Seville as a founder of numerous monasteries and churches. What later became the Spanish primate's see of Toledo was the scene, in the Visigothic period, of about thirty church councils that legislated for the government of society in general, as well as the for the Church itself. A prominent feature of many of these councils was violent legislative hostility to Jews and Judaism. Bishop Leander (ca. 540–ca. 600), as well as championing Catholicism against the Arians, visited and influenced Pope Gregory the Great (ca. 540–604). He was surpassed, though, by his brother, St. Isidore (ca. 560–636), who was also bishop of Seville and metropolitan of Baetica (later Andalusia).

Through his writings on many subjects in addition to theology, including etymology, Isidore had a profound influence on the culture of medieval Europe, and forgers later exploited his name. During the remaining period of Visigothic rule, successive Toledan councils built up the collection of canon law known as the *Hispana*, monasticism spread widely, and the distinctive Spanish liturgy, later known as the Mozarabic rite, was developed. After the Berber and Arab invasions of 711 through 713, Iberia's new Muslim rulers tolerated Christianity as an inferior and subordinate faith, though persecution broke out from time to time. The most notable episodes occurred in Córdoba in the mid-ninth century, where Eulogio, Pedro Álvaro, and other believers, apparently in an attempt to halt Christian assimilation to Islam, attacked Islamic teaching and provoked the Muslim authorities to execute them. Although later dignified as pioneers of a systematic "reconquest" of the former Christian Spain, the fledgling northern Christian statelets moved only sporadically against the Muslim caliphate of Córdoba. Yet the story of the Córdoba martyrs paradoxically indicates the continuing vibrant presence of Catholic Christianity in al-Andalus, in the face of a slow large-scale conversion to Islam. Around 800, circles in the Iberian church and in its Gallic neighbor developed the last notable native-born heresy in the Spanish Middle Ages. Known as

Adoptionism, the main distinctive claim of this doctrine was that, instead of coming from the Godhead, Jesus was "adopted" as Son of God at his baptism. Nevertheless, by about 1000 a large proportion of the Christian population of al-Andalus seems to have converted to Islam.

The conquest of Toledo by Alfonso VI of Castile in 1085 not only restored a historic center to Christian rule, but also opened up surviving Mozarabic Christianity to developments that had taken place in France and Rome during the intermediate period. After the Council of Burgos (1080), successful efforts were made to replace the Mozarabic liturgy with the Roman one, and to strengthen papal control over the whole Iberian church. After 1100 the idea of reconquest was increasingly incorporated into the developing concept of crusade as a divinely sanctioned war against non-Christians, which conferred spiritual benefits on Christians who took part in it. At the same time, reformed French Benedictine monasticism, as represented by the Cluniac and Cistercian orders, served further to integrate the Spanish church with developments beyond the Pyrenees. During the twelfth century, the new type of military order, which combined the religious with the crusading way of life, came to the peninsula, initially in the form of the existing Templar and Hospitaller orders, but soon in native orders, such as Santiago, Calatrava, and Alcántara. The next major steps in the Reconquest, in the early thirteenth century, completed the conquest of Portugal and western Andalusia, leaving the Nasrid emirate of Granada to survive until 1492. At the same time, Spaniards became involved in the development of the new, primarily urban, ministry of friars, by far the most notable being Domingo de Guzmán (ca. 1172–1221), founder of the Order of Preachers. Dominican friars soon became involved in the work of the new papal inquisition, an engine for the identification and repression of heresy. A particular feature of the thirteenth-century Spanish church was the development of orders of friars, notably the Mercedarians and the Trinitarians, the latter of twelfth-century French origin, who specialized in negotiating the ransom of Christian captives in Muslim hands.

During the thirteenth century, a new diocesan structure was established in the southern half of Spain (excluding Granada), though some attempt was made to relate it to the organization of dioceses that existed before the Muslim invasion. Thereafter, the bishoprics of the Crowns of Castile and Aragón were organized into the provinces of Toledo, Santiago de Compostela, Seville, Zaragoza, Tarragona, and Valencia, while the Navarrese see of Pamplona came under Bayonne, and Braga remained the primate's see of Portugal. Only under Fernando and Isabel was this tangled ecclesiasti-

cal geography—which also included bishoprics such as Burgos and León, which were directly subject to the popes—to some extent rationalized. Notable among the diocesans of this period were Lucas, bishop of Tuy, and Rodrigo Jiménez de Rada (ca. 1170–1247), archbishop of Toledo. Lucas of Tuy (in fact mainly based in León) was the author of a world history (*Chronicon mundi*) and a treatise against the Albigensian, or Cathar dualist heresy, that affected Catalonia in the early thirteenth century. He was also a commentator on current affairs, and notably adopted the Greek philosopher Aristotle as a Spaniard, a claim still current around 1500. From his Leonese base, with its strong traditional links to the see of Seville, Lucas firmly resisted the primatial claims of his Toledan contemporary, Jiménez de Rada. Archbishop Rodrigo was the author of numerous works on Spanish history, and also chancellor of Castile under Alfonso VIII and Fernando III, being a powerful propagandist in the latter's cause. He was responsible for the decision to tear down the former main mosque of Toledo, to be replaced by a cathedral in the current Gothic style. Also in this period, some Spanish churchmen made notable contributions to the life of the wider Western Church, one of them being St. Raymond of Penyafort (ca. 1186–1275), a Catalan Dominican friar who was prominent both in attempts to convert Jews and Muslims to Christianity and particularly as a canonist. Also involved in missions to other faiths and in Christian mysticism was the eclectic Catalan Franciscan Ramón Llull (ca. 1235–ca. 1315).

A good example of a political prelate in the fourteenth century was Cardinal Gil Albornoz (ca. 1300–1367), who was active both in the Castilian court and also in the papal court, then at Avignon. In 1365, though, Albornoz made a significant and long-lasting contribution to the education of his country's clergy by founding the Spanish college, specializing in canon law, theology, and medicine in the papal *studium* (university) of Bologna. Despite the upheavals of the Avignon papacy (1309–1377), and the Great Schism of the Western Church (1378–1415), at least one bishop, Gutierre de Toledo (ca. 1330–1389) worked hard to govern his diocese of Oviedo in a manner that would eventually be mandated by the Council of Trent (1545–1563), holding regular synods and drawing up a catechism to assist his clergy in the instruction of the laity. Until nearly the end of the schism, Castile and Aragón, especially the latter, supported the anti-popes in Avignon and later in Tortosa while Portugal retained allegiance to the popes in Rome, whose succession was declared legitimate at the Council of Constance in 1415. During these years, Spanish

churchmen played an ever larger part in the affairs of Europe north of the Pyrenees, and foretold the arrival of Spain as a continental power.

In the turmoil of fifteenth-century Spain, bishops did not hesitate to intervene actively, even violently, in politics. In Castile, Alfonso Carrillo de Acuña (1412–1482), Archbishop of Toledo, played a major part in bringing Isabel to the throne, though they quarrelled both before and after her accession. The pugnacious prelate's tastes included diocesan reform and alchemy, as well as power politics. Carrillo's contemporary, Pedro González de Mendoza (1428–1495), was archbishop of Seville (1472–1485), and then of Toledo until his death. As a member of the upper noble Mendoza family, he was associated with the Castilian Renaissance while the new foundation of the Inquisition (1478) was introduced to Seville during his tenure of that see, once his efforts to evangelize the Judeoconvertos were perceived to have failed. Cardinal Mendoza (of Santa Croce) entrusted this missionary task to Fray Hernando de Talavera (1430–1507), a member of the Jeronymite order of friars (founded in 1373), who was confessor to Isabel and from 1493 until his death was archbishop of the newly reconstituted see of Granada. Although an enforcer of Catholic orthodoxy in the face of Jewish belief and practice, Talavera seriously tried to comply with the terms of the 1492 surrender agreement, under which Muslims were granted religious freedom. He attempted to learn Arabic and gained a reputation among Muslims as a holy man, but his more gentle policies were undermined, firstly by the rebellions of 1499 to 1501, and secondly by the efforts of Cardinal Francisco Jiménez de Cisneros (1436–1517), who succeeded Mendoza in Toledo in 1495. This powerful and complex man, who effortlessly combined hard-nosed politics with a mystical and messianic Franciscan spirituality, had a highly varied career as prelate, inquisitor-general, patron of culture, founder of the theological and humanistic university of Alcalá de Henares (1499, 1508), and regent of Castile, in 1506 to 1507 and 1516 to 1517. Cisneros was an active supporter of printing in Spain, though not of scholastic works, his largest and most famous project being the multilingual translation of the Bible, known as the *Complutensian Polyglot*, produced at Alcalá (published 1520).

Two agencies dominated the life and work of the Spanish Church in the Middle Ages. One of them, the monarchy, had affected Christian life in the peninsula since the first century A.D. It had done so in various forms, first in the Roman emperors; then in the Visigothic kings; in the Muslim caliphs and the rulers of

the small, revived Christian states of the north; in the consolidated kingdoms of the late Middle Ages, and finally in the dynastically united monarchies of Fernando and Isabel. The second essential, though external, force was the papacy, which claimed primacy for its see of Rome, on the basis that its first bishop, St. Peter, had apparently received authority over the whole Church from Jesus himself. (Matthew 16:18–19) As in other provinces of the Western Roman Empire, the Spanish Church inherited forms of government and territorial divisions from secular practice. While the first four centuries of Christian life in Spain saw many upheavals and much violence, at least up to the conversion of Constantine (ca. 312), the arrival of the Visigoths brought relative stability, though the conflict between Catholics and Arians lasted until about 600. Constantine, having become a Christian, was concerned about tying the Church to his own authority and control, even in doctrinal matters, Bishop Hosius of Córdoba (see above) being his righthand man. As part of their quest for at least external continuity with their Roman predecessors, the Visigothic kings took an equally active interest, before 589, in Arian councils, and in Catholic ones thereafter.

After 711 such authority moved to Muslim rulers, but as early as the tenth century, a strong attempt was made by the “kings” of Asturias to revive imperial authority, or at least its religious and architectural trappings, in their capital at Oviedo. Now, though, the explicit model was Charlemagne’s Aachen (Aix-la-Chapelle), rather than Rome itself. By this time, the pretensions of the bishops of Rome had already begun to seem threatening to “national” churches. From the later eleventh century, the reformed papacy made inroads into the life of the Spanish Church, claiming to control the appointment of its leading bishops and abbots, but Spanish rulers, then and later, had one trump card to play in defense of monarchical rights. This was the Reconquest, the ongoing, but generally sporadic, war against the Muslims. It is sometimes suggested that the first military action to be called a crusade, in the sense that Christian participants “took the Cross” with a papal offer of spiritual benefits in return, was a minor campaign at Barbastro in 1064. In any case, crusading greatly benefited the military and the financial activities of late medieval Spanish monarchs. Not only did foreign crusaders join Castilian and Aragónese forces in direct action against Muslim armies, most notably in the battle of Las Navas de Tolosa (1212), which opened the way to western Andalusia, but successive popes granted to Spanish rulers two-ninths of the ecclesiastical tithe (*tercias reales*) and the income from papal bulls of indulgence (*bulas de la cruzada*), which noncombatants might buy as a sub-

stitute for military service. When the final, massive assault took place on the Nasrid emirate of Granada (1481–1492), all these moral and financial benefits were exploited by Fernando and Isabel to their greatest effect, culminating in these rulers’ being declared Catholic Monarchs by Pope Alexander VI Borja (Borgia) in 1496.

As well as repatriating powers over the appointment of senior churchmen and vesting in the king the masterships of the military orders of Santiago, Calatrava, and Alcántara, Isabel and Fernando actively supported reform in the Church. Their efforts to defeat Islam, to expel those Jews who refused to become Christians (after April 1492), and to use the new Spanish Inquisition (1478–1534) to enforce orthodoxy among Judeoconversos, were accompanied by attempts to purify the life of the clergy. They began at the top, using monarchical powers to improve the educational quality and zeal of bishops (Talavera, see above, being a model), and to support movements for reform in the Spanish provinces of the religious orders. Their twofold aim was always to improve discipline and to make traditional structures work properly. In the case of monks and friars, they supported the “observant” movement, which sought to restore the full rigor of founders’ rules for religious orders, and also tended to favor spiritual zeal over academic activity. By all these means, the Spanish Church of 1474 to 1516 became more “national” in character, in a way that late Roman emperors and Visigothic and Asturian kings would have recognized. Such trends were to develop even further in the sixteenth century, under Habsburg rule.

The Catholic monarchs were also very interested in improving the religious and moral character of all their subjects, clergy and laity alike, and here the claims of their courtiers and supporters at the time, as well as those of later enthusiasts, from Diego Clemencín in the early nineteenth century to apologists for General Francisco Franco in the mid-twentieth century, were not totally wide of the mark. The whole Trastámaran Dynasty, in its Castilian and Aragónese branches (1368–1516), succeeded in combining religious zeal with a taste for royal absolutism, and actively patronized favored orders, in particular, the Jeroymite and Franciscan friars. This raises the question of the nature of Christian life in medieval Spain, especially in the centuries after 1200, when pressure against the Jewish and Muslim minorities began to increase once again. At the level of organization and official orthodoxy, the Hispanic Church, at least after the restoration of close organic links with the papacy in the late eleventh century, saw itself, and was generally perceived by outsiders, as a bastion of orthodoxy. Yet

there is a paradox, in that, although Christianity was perpetually on the defense (and at times offense) against Islam, both within and beyond Spanish boundaries, and was therefore determined to remain strong and vibrant, modern historians have tended to regard most of the Christian population in this period as largely ignorant of the faith. It certainly seems to be true that Spanish Christianity, while following the same doctrinal formulae as the rest of the Western Church, preferred to define itself against the rival monotheistic faiths of Judaism and Islam, rather than in terms of the agonies of late medieval Christian scholasticism. In particular, there is virtually no evidence in Trastámaran Spain of internal doctrinal heresies to match those of the Lollard followers of John Wycliffe in England, or of the Czech Jan Hus in Bohemia, in which such matters as the process of salvation of individual Christians and the nature of the Mass were fiercely contested. Instead, as the work of the Inquisition demonstrated, especially in its new foundation after 1478, official Christianity tended to concentrate on ceremony and practical, external observance. In the case of those converts accused of reverting to Judaism and (after 1500) Islam, this generally meant such things as dietary laws, Jewish Sabbath observance, and Jewish and Muslim ritual bathing. Foreign commentators visiting Fernando and Isabel's Spain, such as the Florentine Francesco Guicciardini (1512), took a similar view of Christianity there, seeing the Church's "Old Christian" members as zealous in outward observance, but weaker in spiritual content. The truth of this is hard to measure, and modern scholars, like the inquisitors before them, are generally forced back on to externals.

Catholic Christianity was undoubtedly and evidently an integral part of the fabric of medieval Spain. The results of the past and current donations of the faithful, from king to peasant, were visible in a network of places of worship—cathedral and collegiate churches, monasteries and friaries, parish churches and (in the later period) chantries, as well as innumerable urban chapels and street images, rural hermitages, and wayside shrines. Much church building took place throughout the period, and over all loomed the mighty European pilgrim center of Santiago de Compostela in Galicia, and the influential Catalan Marian shrine at Montserrat.

It is not possible to calculate the proportion, for example, of Fernando and Isabel's subjects who took clerical orders, many of them minor, or entered religious orders, yet cathedrals were undoubtedly well staffed, as were collegiate and parish churches and the urban churches of the mendicant friars. Wherever possible, liturgical life was elaborate, and took place in

churches decorated in a manner that seemed deliberately to defy Jewish and Muslim rejection of religious, and especially anthropomorphic, imagery. Much medieval religious painting still survives, and the treasures of the musical archives of the cathedrals, with their now largely lost choral tradition, are being steadily rediscovered. As elsewhere in western Europe, there was ample opportunity for the laity to participate in public devotion through confraternities, which provided religious and social services for their members. Although Holy Week processions, in their often elaborate modern form, were not to develop fully until later in the sixteenth century, the great summer Eucharistic feast of Corpus Christi was splendidly celebrated, from the late thirteenth century onward. The official liturgical processions, in which the Host, the Body of Christ, was carried in increasingly elaborate monstrances, were accompanied, not by guild mystery plays, as in late medieval England, but by "Moors" and Christians and, in Catalonia, by giants.

What, though, of the "inner" Christian life, with which so many believers north of the Pyrenees were becoming increasingly preoccupied as the year 1500 approached? The basic doctrinal and practical requirements of a lay Christian, in Spain as elsewhere, were limited and formulaic—knowledge, for example, of the Apostles' Creed, the Lord's Prayer, and the Marian *Salve Regina*. But the huge pastoral effort required after 1391, when tens of thousands of former Jews were baptized in a short period as Christians, exposed failings in the Church's efforts to teach its faith to the laity. Of course, knowledge of Christianity might be acquired by many methods other than reading, rote learning, or higher academic study. Paintings and sculpture, liturgy and music, and the indoor and outdoor celebrations of the liturgical year taught the faith, as well as provided social cohesion—and sometimes conflict—as in the anti-converso riots of 1473 in Córdoba, which arose out of a Marian procession by an Old Christian confraternity. Internal discipline, as administered by the hierarchy, concentrated mainly on the clergy, for example in episcopal visitations in the archdiocese of Valencia in the fourteenth and fifteenth centuries, but these, too, focused primarily on discipline and outward practice, as did the ecclesiastical courts, which attempted to police the morality of both clergy and laity. The work of the inquisitors (ca. 1480–1520) often purported to reveal both ignorance of Christianity and violent verbal hostility toward it. Yet outbursts of blasphemy, often expressed in religious terms, may have betokened fury or desperation rather than intellectual disbelief. Religious vocabulary and theological concepts were much readier currency

in late medieval Spain than in the twenty-first century, even if they were commonly expressed outside the tortured intellectual frameworks that were favored by professional theologians. The Church of the Catholic Monarchs and Cisneros was a rich (in both a spiritual and a financial sense) but somewhat ramshackle affair. Its demands on lay people were legal and economic, as well as directly religious, in that many people paid their rent and other fees to bishops, churches, and monasteries, as well as supported the clergy (and the secular government) with their tithes and by helping the army along with their *bulas de cruzada*. Undoubtedly, these economic burdens caused popular resentment and tensions between municipal councils and cathedral and collegiate chapters, but religious devotion was nonetheless expressed in rich and diverse forms. All over western Europe, the unease about Christians' relationship with God, in terms of the salvation of their souls, might cause an overanxious preoccupation with physical works as a means of gaining spiritual security. In Spain, there were the additional perceived pressures of Jewish enmity "within" and Muslim enmity "without." In these circumstances, it is perhaps unsurprising that, as the year 1500 (the half-millennium) approached, many Spanish Christians, both "Old" and "New", took refuge in Messianic, and even Apocalyptic, belief and expectation. It was probably natural that Spanish Jews, faced in 1492 with the choice of expulsion or conversion, should have prayed for the arrival of their Messiah, and transportation to the Land of Israel. But Christians, too, from monarchs down to the humblest farm laborer, commonly believed at this time that the great events of conquest in Granada and "discoveries" in the Americas betokened a unique destiny for Spain in the culmination of world history. Belief in the imminent second coming of Christ thus escaped from the devotion of church and cloister, and directly affected Spanish policy at the highest level. In the event the sixteenth century was to bring different upheavals and demands, but without the preparation of the medieval period, the Spanish Church could not have occupied the prominent position, in Europe and the world, that it subsequently attained.

CITIES

The Celts and Iberians built fortified settlements in the Iberian Peninsula, and some preclassical urban sites such as Numantia (twenty-four hectares) were extensive. The Greeks added to these, usually coastal trade centers at natural ports, such as Rodes and Empurion (Ampurias, ca. 550 B.C.) in northeastern Spain; and a century later the Carthaginians did the same along the southeastern coast where Carthago Nova (228 B.C.) became the major base for the Punic Wars.

Systematic colonization, however, is most associated with the Romans who, after pushing the Carthaginians out of the peninsula, between 197 and 193 B.C. organized Hispania into two provinces. The largest, Citerior, was governed from Tarragona, ancient Tarraco (hence the Tarraconensis), which would develop port cities at Barcino (Barcelona) and Dentosa (Tortosa); inland cities at Gerunda (Girona), Osoa (Huesca), Illegerta (Lleida), Caesar Augusta (old Saladuba, later Zaragoza), and Calagurri (Calahorra); take over Pampaolo (Pamplona); and create a corridor into the interior via Bilbilis (Calatayud), Segontia (Sigüenza), Compluto (Alcalá de Henares), and the border town that would become Segovia. The southern area of old Carthaginensis had port cities at Valentia, Dianium (Denia), and New Cartagena itself. The province of Ulterior, which was an extension of Baetica, made Corduba (Córdoba) a lasting governmental center. The latter province was the most densely populated, having ten indigenous cities that became Roman municipalities and another twenty-six that adopted Roman law but remained semi-autonomous. It included the port cities of Mallaca (Málaga) and Gades (Cádiz), inland Hispalis (Sevilla), and the interior cities of Toletum (Toledo) and Caesarobriga (Talavera). The least urbanized area, the remote frontier of Lusitania, was first controlled from Emerita (Mérida) and became a sepa-

rate province in 27 B.C. The northern Cantabrians and Asturians were subdued from Legio (León) and Asturica (Asturias) by Agrippa for Octavian, who governed from Tarraco until 24 B.C. By Diocletian's time (the division of the empire in A.D. 284) Roman roads from Salamanca penetrated even Gallaecia to cities at Lucus Augusti (Lugo), Bracara (Braga), Conimbriga (Coimbra), Portucale (Oporto), Scallabi (Santarem), and Olisipo (Lisbon), bringing the entire peninsula under the mythical *Pax Romana*.

Just as the concept of urbanization comes from *urbs*, the archetype being Rome itself, the term *municipality* is from the Latin root *munus*—that is, the combined obligation of military service and tribute. The Romans recognized cities both as places and as corporations of citizens having status, rights, and obligations: *foederati* were allies subject to taxes, military service, and Roman law; the *civitates dedititiae* were taxpaying neutrals that retained some autonomy within the burgeoning Roman Empire; and *stipenderiae*, which, like Numantia, had to be taken by force (in this case, a twenty-year campaign), were subjugated and exploited by a burdensome tribute.

The governance and law created by the Romans to assimilate cities into the empire remain the foundation of municipal law, even to this day. Municipal law coalesced into code, the *Ius latii munus*, in A.D. 73 under the emperor Vespasian. It was augmented from practices by the *Constitutio Antoniana* in A.D. 212 when Emperor Antoninus Caracalla imposed uniformity on municipalities as imperial cities. In the multicentury conversion of Roman hegemony from brute subjugation to federation and alliances, such law evolved to accommodate home rule through representative government: the municipal *curia*, modeled after the Roman senate; an executive usually composed of two magistrates (*duumviri*) or judges; and two police captains (*aediles*), who by the end of the empire evolved into *defensores*. The *urbs* or urban core and a *territorium* comprised a city-state. Inhabitants included self-governing citizens (*cives*); colonists (*coloni*) subject to an external jurisdiction; guests (*hospites*); and slaves.

The late antique cities suffered from the post-Theodosian fragmentation of the empire, and after A.D. 407 civil war racked Hispania. Although many Roman cities were attacked and sacked by the various Germanic invasions after 415, they survived as Hispano-Roman enclaves—many reduced in size—while the nomadic tribes migrated through Spain or occupied outlying areas and the less densely populated highland plains that reminded them of their homeland steppes. Visigothic rule continued Roman municipal law and by the seventh century fused it with Germanic custom in the *Liber iudiciorum* of King Reccesvinth. County

government grew at the expense of cities due to the rural preference of the overlords and elevation of the *comes civitatis*. Surviving cities, however, were often ruled by an oligarchy of *villici* or heads of major households. Whereas historians once claimed that the invasions had destroyed the network of Roman municipalities, revisionists see the decline in municipal government as a seventh century phenomenon and an essential continuity in the existence of the most important trade centers as functioning cities. Sánchez Albornoz, for example, has argued for the continuity between old curial government and local assemblies with later councils (*concejos* and *cortes*), which is seen as a tradition of Spanish freedoms (*fueros*), law, and representative government.

The Muslim conquest (711–718), after initially damaging cities such as Tarragona and Barcelona in what was to become a lasting frontier with the Christians where major fighting reoccurred, subsequently reinforced peninsular urbanization. Muslims resurrected the Roman territorial demarcations, identified regional capitals such as the Romano-Visigothic Toledo as their own, and rebuilt such cities as Zaragoza, Tortosa, and Lleida to defend the Upper March. New cities were founded, such as Murcia, built by ‘Abd al-Raḥmān III in 831, or Úbeda; and the Toledan outpost of Machrit founded by the Caliph Muḥammad (852–886) would eventually become Madrid. After an initial invasion by an estimated 35,000 Muslims, there were waves of immigration from the north Africa Maghrib, the Berbers, Slavs, Syrians, and later the Murāḥit (Almoravid) and Muwāḥhid (Almohad) invaders, augmented by the recruitment of mercenary armies, the medieval slave trade, and the welcoming of merchant Jews. The Muslims thus overlaid a base population of Hispano-Roman and Visigothic people who in time converted to Islam, the *muwalladūn* (*muladíes*), and tolerated both Jews and Christians, or Mozarabs.

Debate about Muslim urbanization often centers around estimates of city populations exaggerated partially because Christians of the rural north, largely composed of highland tribes and farm communities in the valleys, so marveled at southern cities and the sophistication of the Muslim Mediterranean and old world culture. The demographic research of Torres Balbás is still seminal to such debate. Based on the number of mosques, the enlargement of walled cities, the counting of adjacent gardens or *huertas* that often formed suburban clusters around cities proper, and other inferential data he estimated that during the height of the Umayyad caliphate during the last half of the tenth century, the largest Muslim city, Córdoba, reached slightly above 100,000 inhabitants (in contrast to the wild numbers—up to a half million—once ban-

died about); it was much greater than the next largest city, Toledo, with 37,000 residents maximum to the lower range of 28,000; Almería and Granada, with approximately 27,000 and 26,000, respectively; and Málaga, Jerez de la Frontera, and Badajoz, which were slightly smaller at 24,000, with the lower estimates for these cities at 20,000. Zaragoza is estimated at 17,000, followed by Valencia at 15,000. Torres Balbás thought that Sevilla’s population could not be estimated, but others have ventured the plausible guess of 52,000 at its height. Moreover, these cities changed in size and importance across the centuries with two major African interventions and three periods of *ṭawāʾif ṭāʾifa* parochialism; the Christian Reconquest sent Muslim refugees south and conversely promoted emigration by Mozarabs to the north, as in the case of Alfonso I el Batallador’s policy in repopulating lower Aragón after his conquest of Zaragoza in 1118 resulted in a major reduction in its populace. Such migrations from Lleida and Tortosa after 1148 swelled the Mediterranean coastal cities, especially Valencia. Only with Jaime I’s conquest of the latter city in 1238, and perhaps earlier with Mallorca, did the Crown of Aragón absorb a large Mudéjar population. Sevilla and Toledo contained large, densely populated Jewish quarters, with perhaps 5,000 and 4,000 residents, respectively; but most Juderías were much smaller: Zaragoza held about 1,200 Jews, Tudela 1,000, and modest cities like Carmona only enclaves of about 200. Overall, the urban-to-rural ratio of population distribution in Muslim Spain before 1348 (i.e., the pre-plague years) has been estimated at 5 to 100 (5 percent).

Muslim city-states were even more centralized than Romano-Visigothic cities because of their large mosques in centers of learning and government, complete with the largest libraries in all Europe—especially that of the Great Mosque in Córdoba. Muslim cities were densely populated, walled enclosures that usually contained a central square, an open-air market, a mosque, a courtyard school, a government house, and a royal residence and court. Outside was the *alfoz* or *terminus*, similar to the Christian *comarca*—territory associated with the urban center. Most cities had extensive waterworks (repaired Roman aqueducts, cisterns and drains, sewers, etc.) and Muslims often maintained citadels (*alcázares*) and refuge castles on an historic Greco-Roman acropolis (e.g., La Zuda at both Lleida and Tortosa); subsidiary castles to protect the lower city and commercial districts; fortified main gates and bridges; and sometimes outlying blockades and earthworks along irrigation ditches, as well as stone terraces and the natural defense of rugged terrain. Throughout their territories,—strategically ringing the city itself—were dependent castles, watchtowers, and

nonresident refuges for emergencies. Most of Spain's cities were as formidable to enemies as they were havens to their citizens.

An aristocracy of first-arrival families flourished inside each Muslim city, with an ever larger bureaucracy that tended to be open socially and therefore expanded to include lawyers and theologians loosely associated through various forms of patronage with the court. Urban mobility seems to have increased after 1031 in the absence of the controlling social influence of the caliphate. 'Abd al-Raḥmān II reorganized municipal government based on the oriental model. Key officers included the *Ṣāḥib al-suq* or *Muḥtasib*, market overseers with extensive judicial authority in civil matters, who may have evolved into *dīwāns* or chief financial officers; the *Ṣāḥib al-madīna* or *Zalmedina* (*senior civitatis* or prefect), a top-ranking public magistrate; judges (*qāḍī*) of all kinds; and the *Ṣāḥib al-shurtah* or chief of police who often formed special tribunals and came to control *ṭawā'if* mercenary armies. After the 1090s the Almoravids reverted back to military governorships (*wālī*, or *qā'id* in war zones) to control the *ṭawā'if* kingdoms, and the Almohads used viziers and an extensive network of couriers and inspectors working with local bureaucracies. The Naṣrids of Granada had these officials working in circuits or judicial districts called *kūra* (in, e.g., Guadix, Málaga, and Almería).

Christians brought their fortress mentality to bear on the idea of a city. The law code of the learned king Alfonso X, *Las Siete Partidas*, defined a city simply as a walled enclosure with buildings inside, nothing more. Muslim urbanity, both in size and quality of life, stood in sharp contrast to the predominant rurality of northern Spain, which during most of the Reconquest period could boast of no cities with populations over 2,000. The urban/rural ratio in the Christian population was no more than 1 to 100, meaning that Muslim Hispania was five times more urbanized than the Christian north, not counting the *despoblado* (deserted area) between them. The largest Christian cities of Compostela and Lugo in Galicia; Astorga and León in Castile-León (overlooking Burgos, which as its name implies, was merely a town); Oviedo in Asturias; Pamplona in Navarre; and Barcelona in Catalunya barely reached 1,500 inhabitants each during the eleventh century. The Reconquest was always hampered by a chronic manpower shortage until supplemented by major immigration across the Pyrenees, first through monastic connections and pilgrimage routes to Santiago de Compostela that helped Jaca, Pamplona, Estella, Logroño, Nájera, Burgos, León, Ponferrada, and Lugo as well as Santiago to grow; second, through the twelfth-century Crusades, which brought knights from as far

north as Normandy and England who stayed in Spain because of the availability of land to substitute for estates most could never inherit in their homelands, and in cities like Lisbon, Tarragona, and Tortosa, where they benefitted from the spoils of war; and third, through the settlers attracted by the Cistercian monks and other colonizers, and an increasingly international middle-class of merchants and entrepreneurs lured south by the prospects of lucrative trade and fast profit along the war zone. They enlarged towns like Salamanca and Valladolid in the old Duero River frontier, which would become increasingly important cities by the late Middle Ages. Christian kings bestowed lands to a new frontier aristocracy and created new seignorial estates, but after the reconquest of Muslim cities such as Toledo they also offered attractive *fueros* to newcomers who replaced those residents they lost to the wars and emigration; they raided Muslim lands and coaxed Mozarabs there to return with them to Christian territory; they welcomed Andalusian Jews who fled the Almoravid and Almohad takeover of Al-Andalus; and they forged far-flung alliances both for military support and resettlement, as well as for long-term commerce. Rulers retained the Roman obligation of military service from townsmen. Warring kings relied on municipal militias to hold their cities and to operate in nearby territories, as backup for prolonged siege operations, and when attacking to swell their *huestes* with foot soldiers whose slower deployment and ability to dig in and hold ground so necessarily complimented the more rapid maneuvering of knights who initially took it.

When the Christians occupied former Muslim cities they usually rearranged things by rebuilding and taking over the central complex and outlying fortifications, creating military compounds in the cities and giving outposts to the military orders, and forcing inner-city dwellers to relocate to suburbs; but they were anxious to maintain public works, markets, and trade. The expulsion of entire Muslim populations was not preferred treatment; one may gain initially from confiscating the property of exiles, but property by itself does not generate ongoing revenues. Subjects were taxable. Along with Muslim emigration was certain assimilation. Mosques were converted to cathedrals, just as they had risen long before from Roman temples. True to their habit of defining the rural landscape with boundaries, Christians carved cities into seignorial districts and barrios that may have grown naturally as neighborhoods but became more officially delimited as *collationes* or tax collecting circuits that often coincided with tithing districts of *parroquias*. To free themselves of lay control, bishops insisted on their own ecclesiastical space—sometime whole cities, as in the

cases of Santiago or Tarragona. In addition to Jews in their *aljamas*, and the Muslim *morerías* for the Moors, other people of like origin and language gathered together into localities within cities (as did the “Franks” in Toledo, whom Alfonso VI recognized as a separate “nation”) often centered around their parish churches and linked together through intermarriage, social confraternities (*cofradías*), and trade guilds. Urban societies became more stratified and segregated as they expanded in the late Middle Ages.

In the tradition of Roman municipal law passed through both *fueros* or *franquicias*) and the *Liber iudiciorum*, Luso-Hispanic cities as early as 1020 (e.g., León) resurrected assemblies (the *conventus publicus vicinorum* or *concilium*) for popular representation in government and forums for public discussion, formed municipal councils (*concejos* or *cabildos*) with distinguished advisers (*boni* or *probi-homines*) by virtue of their social status and political delegates (*jurados* or *fieles*), headmen such as consuls (sometimes forming an executive committee or *consulado*), elected mayors (*alcaldes*, from the Arabic *al-qādī*, which really means “judge”), and also bred specialized offices such as bailiff with various titles (e.g., *batlle*, *veguer*, etc., in Catalan) and captains (equivalent of the *alférez*) of the local militia, but the administration of justice was often carried out by judges (*iusticia* or *judices*) appointed by counts. In Castile-León after the centralist reforms of Alfonso XI (1312–1350) introduced the *Regimiento*, elected magistrates were replaced by lieutenants appointed by the crown, *regidores* or two *corregidores*, one to keep check on the other. Townsmen usually resisted such royal encroachments, however, and taking their cases to the royal curia or cortes or gaining hearings by the *audiencia* they often bargained freedoms back or negotiated new privileges in exchange for taxes which the kings always needed to conduct their expensive wars.

Reconquest Castile-León grew from perhaps three million people in the eleventh century to a range of four to five million by the fourteenth century; and the Crown of Aragón perhaps grew to a million people. The largest cities in medieval Spain, however, continued to be those in the south. The year 1348, when waves of intermittent plagues first arrived, divides periods of urban development in Spain and Portugal as significantly as did the Reconquest. Catalunya, for example, lost a fourth of its population, and in all regions the cities were the hardest hit. The fifteenth-century census of Alonso de Quintanilla provides data for Granada’s 1.5 million households and other sources, including tax records and those of the Inquisition, and telling detail about the impact of the plague, intermittent civil strife, tough economic times, popular reli-

gious movements, and social classes and mobility. In one case, for example, Lleida in 1359 is known to have had 5,459 residents after the first wave of plague; by 1497, just after the completion of the peninsular reconquest with the fall of Granada in 1492, this Arago-Catalan city was reduced to 3,362. It continued to decline to a low of 2,353 in the early 1700s, about the same size of Christian cities in the Middle Ages. The hinterland returned to a more rural state while coastal cities such as Barcelona or the Tarragona-Reus metropolitan complex expanded. The same happened along the Cantabrian, Atlantic, and southern Mediterranean coasts. The Catholic Monarchs ruled a united Spain of some nine million people that was still predominantly rural and agrarian, with regional trade centers mostly where they had been since Roman times, and the same cities dominating urban affairs of the peninsula as always, with the notable exception of Madrid.

CIVIL SERVICE See CENTRAL ADMINISTRATION

CLOTHING

At the beginning of the Middle Ages, the Visigoths introduced some Germanic elements into the classical costume of tunics and cloaks inherited from the Late Roman Empire, such as the *tuburcos*, and femoralia leg coverings.

In the tenth century, coincident with the splendor of the caliphate of Córdoba, Christian miniatures represent a surprising variety of tunics, cloaks and headgear without parallel in the rest of Europe, with Muslim influence evident in some of them.

During the eleventh and twelfth centuries links between Spain and the rest of Europe grew closer and,

with the appearance of great Romanesque art and the resurgence of Christianity, a costume was born that was common to the whole western world. The Romanesque costume for both sexes consisted of one or two tunics and a cloak. The inner *brial* tunic was used as a long undergarment, while the outer *piel* or *pellizón* tunic was shorter and lined with fur. Typical of Romanesque costume were the ornamental additions on bodices and sleeves in the Byzantine manner, and a whole range of sleeves that later disappeared. Furs began to be used on a grand scale, and this was to continue. A special feature of Spanish costume were women's headdresses made of bands of entwined or plaited cloth.

Major changes occurred in the thirteenth century, coincident with the early Gothic era. Garments were characterized by their simplicity and comfort. There was no great difference in the clothes of men and women save in their length; men abandoned the down-to-the-heels costume of the previous period. Garments took on much more varied shapes. There was underwear for intimate or home use (*sayas* or *gonelas*), outer garments (*pellotes*), and outdoor clothes for cold weather (*garnachas*). The outer garments and outdoor clothes had a variety of sleeves, including cut-away and hanging sleeves with slits through which one put one's arms. The Romanesque cloaks, knotted on one shoulder, were now substituted by *capas con cuerda*, which allowed more freedom of movement. In headwear the chief novelty was the appearance of the *capirote* (hood), which went through various transformations in subsequent centuries. Although it had great similarities with that of other Christian countries, Spanish dress was remarkable for its originality. Typical Hispanic features were the *pellotes*, very deeply cut away from arm to hip and two-colored clothes *a metades* (both of these would pass to the rest of Europe during the fourteenth century); the *cosedizas* removable sleeves; cloaks and capes with side openings; feminine shirts embroidered with colored silks, and strangely shaped women's headgear with a parchment frame to which very large bands of plaited cloth were attached.

During the first thirty years of the fourteenth century, the fashions of the thirteenth century were maintained with only a few small novelties, such as the low neckline for dresses, which appeared for the first time. Thereafter, came a period of great change. The men's clothes, reflecting the changes in armour, were now lined with cotton and became gradually shorter and tighter, until a little before 1380 they reached the appearance of the *jaqueta* and the *jubón*. It was a revolution in the history of European dress, because the legs remained entirely uncovered for the first time. Men

and women both wore higher necklines, and there was a profusion of small buttons and hanging elements from the elbows and hooded *capirotos*.

During the last years of the fourteenth century and the first years of the fifteenth, fashion seeks out everything that is complex and extravagant: sinuous outlines, and contrast between long and short or tight and loose. Tailoring became an expert art. From then on the variety of garments was such that is not possible to offer, in a short summary, even a brief list of them.

The fifteenth century brought gradual changes from a fashion common to all Christianity to one that was nationally distinctive. The man's costume in Spain followed very closely the fashion centered on the magnificent court of the dukes of Burgundy. The area of the Crown of Aragón also received some small Italian influences. As the century advanced it incorporated some Mauresque elements. Fashions followed one upon another. In the 1420s the masculine silhouette was of rounded and swollen forms, large heads and low waistlines, but around 1430 a new fashion appeared, coexisting for some time with the previous one: the waistline returned to its natural position. A little before midcentury the Burgundian court created a new style that was to impose itself on half of Europe until a little after 1477. In it the man emphasized, above all, slimness and contrast between the wide shoulders and the thin waist and hips; headgears rose, shoes became more pointed, the folds that had covered the costumes from top to bottom with perfect regularity now emphasized verticality. Most notable among outdoor garments was the closed *capuz*, with its hood; it was said to be for Spaniards what the toga had been for the Romans.

Women's dress, though it absorbed Franco-Flemish influences and more infrequently some Italian ones, always interpreted them very freely, and showed an increasing originality as the century progressed. We note as typical Hispanic features a great variety of cloaks of different cut—very short in the first half of the century and later longer; shirts with superimposed *listas* (ribbons) or embroidered *tiras* in the Mauresque manner; *cofia de tranzado* (headgear with a lining adorned with ribbons enveloping the platt); *chapines* (shoes with thick cork heels); and *verdugos* (hoops that filled out skirts). Several of these fashions passed on to other European countries during the Renaissance.

COFRADÍA

The word *confraternity* or *cofradía* assumed diverse meanings during the medieval centuries. An association organized for fraternal and charitable purposes, a confraternity could also be intended to advance the economic and professional interests of its members. Confraternities begin to appear in important numbers from the twelfth century onward. Initially they were religious in origin, and were often composed of the residents of a parish or dependents of a monastery. The Cofradía de Frontarya y Lillet in Catalonia appeared at the end of the eleventh century, while in the twelfth the Cofradía de Santa Cristina of Tudela made its appearance. Also in the twelfth century Alfonso I of Aragón (1106–1134) organized the confraternity of Belchite for the defense of that newly recaptured position. A similar confraternity was organized at Uncastillo. To some extent the emergence of confraternities of this type anticipated the organization of the Spanish military orders in the second half of the twelfth century.

In the twelfth and thirteenth centuries, as industrial activity began to increase in volume, confraternities were organized in towns for economic and political purposes. These guilds or *gremios* were associations of workers and artisans interested in monopolizing their trade or craft and protecting themselves from external competition. The confraternity of muleteers (*recueros*) of Atienza and that of the shopkeepers (*tenderos*) of Soria were among the earliest to be established. Often members of a confraternity lived in the same street, as the street names in many older sections of Spanish cities still testify; and worshiped in the same parish church. That closeness enhanced their bonds of community and enabled them to carry out their activities more easily. The municipal *fueros* (statutes) of the eleventh and twelfth centuries often regulated the activities of working men and women, as did the later enactments of the *cortes* (parliament). Royal attitudes toward confraternities in Castile tended to be negative at first unless those associations existed only for religious and charitable purposes. Both Fernando III and Alfonso X condemned wicked associations (*cofradías malas* and *ayuntamientos malos*), that were seen as a detriment to royal authority. Alfonso X forbade mer-

chants and artisans to fix prices and demanded that they sell their products on the open market. Also condemned was the tendency to reserve places in the craft to family members, as noted in the *Siete Partidas*.

In Aragón similar attempts were made to restrain the guilds, but in Catalonia, where the industrial middle class was more fully developed than elsewhere, guilds were more successful. The crown authorized their existence and in 1337 Pedro IV granted the towns the right to establish and to regulate guilds. Despite those strictures confraternities or guilds with a distinctly economic aim continued to appear, and by the close of the Middle Ages were found in most important towns. In the course of time they also endeavored to limit admission to their organization thereby effectively sharing the profits of their enterprise among fewer people. In 1389, for example, the artisans of Barcelona required that a prospective member demonstrate his fitness by proving that he had the necessary financial resources. He could either pay a substantial admissions fee or display a shop full of goods that he may have just acquired. Sons of masters were exempt from these obligations, and outsiders had to pay a doubled entrance fee. The apothecaries of Barcelona limited to two the number of new masters admitted each year and required an examination of their technical qualifications as well as payment of the fee. As happened elsewhere in Europe, an urban oligarchy gained control not only of municipal government but also of trade. Juan I of Aragón, for example, authorized the merchants of Barcelona to establish a council that would oversee trade and resolve commercial conflicts. As a consequence, the opportunity of the ordinary workingman to establish himself as an autonomous master craftsman with his own shop was greatly curtailed. The great divide between the urban oligarchs and ordinary workers often led to social upheavals in the towns.

Anyone seeking admission to a confraternity was first required to swear an oath to uphold the interests of the association. A general assembly or *cabildo general* brought all the brothers together to deliberate on rules and regulations, the appointment of inspectors who would guarantee good workmanship, and the election of officials. The principal officials, usually numbering one to three, were called *prebostes*, *mayordomos*, *mayorales*, or *priors*, and were ordinarily assisted by a committee of assessors. From time to time the confraternity might draw up ordinances regulating its affairs, as did the shoemakers' guild of Burgos in 1259. With the consent of the municipal council, ordinances were drafted providing for the taking of apprentices and the use of suitable materials under city inspection. These tended to become more detailed in the later medieval

centuries. From time to time the king confirmed such ordinances, usages, and privileges, as Alfonso X did for the textile workers of Seville and Soria. The ordinances usually provided for the peaceful resolution of conflicts among the brothers and the imposition of fines on those who neglected to abide by the regulations of the guild. No matter what the varying purposes of confraternities may have been, each had a religious aim, each had a patron saint whose feast day was observed by solemn attendance at mass in the saint's honor, usually followed by a banquet. The brothers also were expected to take care of sick members, visiting them, observing the administration of the last rites of the church, attending the burial ceremonies, and commemorating the deceased in regular prayers. If a member was incapacitated, others would take his place at work and provide economic assistance for him and his family. Aged family members, widows, and orphans were all taken care of and dowries were provided for poor girls.

COINAGE AND CURRENCY, ARAGÓN

With monetary antecedents during the Iberian and Roman eras, the Visigoths established a few mints in the region, the mint of Zaragoza being the most productive.

After the Arabic invasion, Christian currencies were initiated by Sancho el Mayor (1000–1035), when Aragón was part of the Navarrese kingdom. Sancho's successor, García III (1035–1054), issued *vellón* coins with inscriptions reading "ARA-GON". These coins were minted in Jaca, giving them the name *dineros jaqueses*, a term that would continue even when production moved to Zaragoza. In the zone occupied by the Arabs, the mint of Zaragoza was especially active during the *tā'ifa* period (eleventh century).

Aragón regained independence in 1076, also gaining control of Navarre. The coins issued were exclusively the *dineros jaqueses*, although at the beginning of the twelfth century the gold *morabetín* of Almoravide origin was also used. King Sancho Ramírez (1063–1094) issued a gold coin called the *mancús de Jaca*, but it seems to have only been used in the payment of tributes to the pope.

The *vellón* coin, minted exceptionally in Monzón and Sarifiena, was the only legal circulating coin from the mid-thirteenth century to the early fifteenth cen-

tury. Aragón's union with Catalonia in 1137 would not change this plan. Pedro III (1336–1387) did issue gold *florines* in Zaragoza during a period of three years, but production ceased because the Aragónese citizens rejected the florin, preferring their own coins. Weak commercial activity before the fifteenth century did not lead Aragón to adopt coins of a higher value; in addition, with one type of coin (the *jaqués*), speculation associated with trade and exchange was avoided.

From the mid-fifteenth century gold *ducados* and silver *reales* were issued in Aragón, but their influence was of little significance. In the Teruel region in the fifteenth century, Valencian coins circulated as a solution to the weak value of the Aragónese currency; contracts, however, were still stipulated in terms of the *jaqués*, which was the legal currency. Throughout the Middle Ages, payments in kind continued to be made, particularly for annual taxes.

COINAGE AND CURRENCY, CASTILE

There is no evidence that before the eleventh century the rulers of León and Castile coined money. Transactions that were made in money apparently utilized Islamic gold and silver coins. The first indisputable evidence for a royal coinage emerges during the reign of Alfonso VI (1065–1109), who minted billons (*vel-lónes*) of *denarii* of alloyed silver. Originating from the monetary reforms of Charlemagne, the billon *denarius* was the coin common throughout feudal Europe in this period. Because it was lower in value than the Islamic silver *dirhem*, it was more useful for common, daily transactions. This convenience, combined undoubtedly with royal insistence, helped the *denarius* eclipse the use of Islamic *dirhem*, in twelfth-century Castile-León, although Islamic gold continued to circulate. The Almoravids had introduced a reliable gold piece, the *morabetino*, which Castile adopted as a standard of value. While payment was made in either gold or

its billon equivalent, prices were normally quoted in morabetinos.

In relation to the morabetino, the denarii, or dineros, of Castile-León gradually declined in value. True to their Carolingian heritage, dineros were counted in groups of twelve, called *solidii* or *sueldos*. By 1217, the morabetino in Castile was worth 7.5 *sueldos* of *dineros burgaleses* (90 coins) or 15 *sueldos* of the debased *dineros pepones* (180 coins). In the then separate kingdom of León, it was worth 8 *sueldos* of *dineros leoneses* (96 coins). As the value of gold in terms of billon coins continued to rise, another method of counting emerged: the morabetino of account. Defined as 90 burgaleses or 96 leoneses, the morabetino of account was a fixed number of billon coins that did not fluctuate with the market price of the gold morabetino.

In the second half of the thirteenth century, a series of a billions of coins, each intrinsically weaker than its predecessor, drove older coins out of circulation and decreased the value of the morabetino of account. Between 1264 and 1268, Alfonso X (1252–1284) minted the *blanca*, or *moneda de la guerra*, a denarius with one-third less silver than the burgalés. He later issued the *prieto*, a coin declared to be worth 6 blancas but intrinsically equal to only 4. A second, weaker 6-denarius coin appeared by 1279. It was also called a *blanca*, so the original *blanca* came to be called a *blanquilla*. In theory, the morabetino of account in 1280 was made up of 90 blanquillas (or 96 of the same blanquillas in Leon), but it was usually composed of 15 *seisenes*, coins worth 6 denarii apiece.

The *cornado*, a 9-denarius piece or *noven*, appeared in the early years of Sancho IV (1284–1295). There were, then, 10 *cornados* counted to the *morabetino* but these contained less silver than 15 *seisenes*. Fernando IV (1295–1312), in turn, issued a new *noven* weaker than the *cornado*. To halt the disappearance of the old money, Fernando retariffed the coinage in 1303. Keeping his own coin fixed at 9 denarii, he raised the value of his father's *noven*, the *cornado*, to 15 denarii and the second *blanca* to 12. As a result of this reform, there were now 6 *cornados* to the theoretical morabetino of 90 denarii. Though repeatedly debased throughout the next 150 years, the *noven* and *cornado* remained the basic billon denominations of medieval Castile. In the fifteenth century, the morabetino was still defined as 6 *cornados* or 10 *novenes*, the latter often called simply *dineros*. Additionally, a new *blanca* appeared under Enrique II (1369–1379) with a value of 2 per morabetino, and continued to be minted by his successors.

The fourteenth century also saw the introduction of a new series of gold and silver coins. When the Islamic world ceased producing the morabetino, Alfonso VIII (1158–1214) prolonged its hegemony in

Castile by minting his own gold *morabetino alfonsí*. At the same time, the Almohad gold piece, known as the *dobla*, was entering Castile. The Castilian crown probably ceased minting morabetinos by the 1260s and was regularly minting *doblas* by the reign of Alfonso XI (1312–1350). His successors continued to strike *doblas* and sometimes added larger denominations, such as the 10-*dobla* piece. Alfonso XI had originally fixed the full *dobla* at a value of 35 morabetinos of account. In 1435, however, the market price was between 85 and 96 morabetinos.

Pedro I (1350–1369) introduced the *real*, a coin of almost pure silver originally valued at 3 morabetinos. According to the documents, its weight and fineness were scrupulously maintained into the reign of Fernando and Isabel. Originally worth 3 morabetinos, the *real* commanded 8 morabetinos current billon in 1442. Though these silver and gold issues helped fulfill the demands of an economy increasingly involved in long-distance trade, the heart of the Castilian monetary system remained the morabetino of billon to which all other monetary values were tied.

COINAGE AND CURRENCY, CATALONIA

Catalonia was the chief port of entry for money in the Iberian Peninsula. In the fourth century B.C., the Greeks minted coins in their colonies in Rhodes and Emporion; the coins of the Iberian tribes, who were later Romanized, were derived from these Greek coins. The official issuing of Roman money in the peninsular capital, Tarraco, marks a final point in the first century A.D.

The Visigoths issued their gold *trientes* in Roses, Girona, Barcelona, Tortosa, and Tarragona, but only the mint in Tarragona achieved any prominence.

The minting of coins, interrupted by the Arabic Conquest (714), was renewed around 800 with the French invasion of the northern half of the peninsula. Charlemagne issued silver money in Barcelona, Girona, Empúries, and Roses. His successor, Louis the Pious (814–840), would do the same in Barcelona,

Empúries, and Roses, while Charles the Bald (840–877) would only issue money in Barcelona. Throughout the tenth century, Carolingian territories were converted into *condados* (counties) and independent domains, with each region producing its own currency. These territories included Barcelona, Urgell, Empúries, Cerdanya, Rosselló, Besalú, and Pallars, as well as the dioceses of Vic and Girona and the viscountship of Cardona. This mosaic of territories was later annexed to Barcelona, the most active center, and the various coins soon disappeared, substituted by the Barcelona currency. This reunifying process was well underway in the twelfth century, though it did not conclude until the beginning of the fifteenth century.

From the tenth to the thirteenth centuries, circulating money consisted of coins of *vellón*, a silver-copper alloy, although in the eleventh and twelfth centuries gold Arabic coins also circulated: the *dinar* of the caliphate (tenth through eleventh centuries) and the *morabetín* of the Almoravide dynasty (twelfth century). The crisis that affected the issue of the Arabic gold coins during the *tā'ifa* period (eleventh century) was solved in Barcelona by minting imitations of the *dinar*—some coins even displayed part of the legend in Latin, displaying the name of the count, Raimundus Comes.

By the end of the thirteenth century the *vellón* coins of Barcelona were practically the only coins in circulation. The union with Aragón (1137) and the conquests of Mallorca (1229) and Valencia (1240) would lead to the creation of a political unit governed by only one sovereign, in which coins with several different engravings, but the same value, circulated. With Alfonso I (1162–1196) this currency was the *quatern* (33 percent silver) and with Jaime I (1213–1276), the *tern* (25 percent silver). This monetary correlation would also reach Provence, then a territory of the Catalan monarchy.

Between the end of the thirteenth and the middle of the fourteenth century, the monetary system was broadened as a consequence of territorial expansion (the annexation of Sicily, Cerdeña, and later Naples) and rapid economic growth. The year 1285 saw the introduction of the *croat*, a silver coin with the value of twelve tern coins, followed by the 1340 appearance of the gold *florín* (a copy of the Florentine prototype worth eleven croat coins), which was stabilized at a moderate purity of eighteen carats (75 percent gold) in 1365. From then on, with the growing presence of the *croat* and the *florín*, the circulating currency was bimetallic, consisting of silver and gold coins.

With the Mediterranean expansion, the monetary system began to use one gold coin common to all countries, the *florín*, and a silver coin with different engravings and names (*ral*, *pirral*, *croat*), but with the same value as the *croat* of Barcelona. The *vellón* coin, the

small change of everyday life, would, however, undergo different changes in each kingdom. Only Aragón, which was less developed commercially, would escape this general scheme; until the end of the fifteenth century it would continue using a system made up exclusively of a *vellón* coin called the *jaqués*.

In the fifteenth century several transformations took place: the *florín* of uniform marking and low purity would be replaced by the *ducado*, a Venetian-derived coin of high purity (98.97 percent gold) that adopted different markings in each kingdom. The silver coin continued to be used, following the *croat* model of Barcelona. A crisis originating in the fourteenth century prevented further minting of the *vellón* coin, though its value continued to be used as the reference for all payments that were made with the tern and its multiples: the *suelto* (twelve tern) and the *libra* (twenty *suelos*). The interest in maintaining the value of those payments made reducing the value of the tern undesirable, but the tendency to lower its value in other neighboring countries, along with the presence of other stronger coins (the *florín* and the *croat*), made the devaluation necessary. For a while the mints stopped producing the tern, which created a serious shortage of petty change that was resolved by the municipality's decision to mint coins locally. In the late fifteenth century, authorities decided to diminish the value of the *vellón* coin by half, but the shortage of small change and the recourse of minting local coins subsisted until the seventeenth century.

Despite these changes, Catalan money was characterized by great stability relative to the currency of many European countries and especially that of Castile, where the *florín* of the Catalan-Aragóense kingdom was at times used as a point of reference for establishing value. The *croat* was, nevertheless, the coin that experienced the most stability, and was Catalonia's preferred means of carrying out their extensive commercial activities in the Mediterranean.

COINAGE AND CURRENCY, LEÓN

In the northwestern zone of the Iberian Peninsula, known in the Middle Ages as the kingdom of León, there was no ancient precedent for issuing currency, except for the presence of a roving Roman workshop in the Cantabrian-Asturian and Galician regions during the Cantabrian wars of the first century A.D.

The Suevi tribes that settled in the region (fifth century) were the first to mint money there. After the Visigothic Conquest (585), they continued to issue; money and open many new mints, with twenty-five within the Galician-Asturian-Leonese zone, including one each in León, Salamanca, Sanabria, Lugo, Túa, and Orense. These, however, were short-lived.

The entry of the Arabs marked the beginning of a long period without monetary issue. This continued even after the consolidation of the Asturian-Leonese monarchy, and we have no indication of the fabrication of money until the reign of Fernando I (1035–1065). There are various hypotheses as to how payments were made; the validity of a barter economy, however, can only explain in part the absence of currency in a society in which the concept of money is very much a reality, as documents show. One theory is that Visigothic, Swabian, and even Late Roman currencies survived, but it has been shown that Roman and Swabian coins did not last through the Visigothic era, and that Visigothic money was only used for fifty years at most. This all indicates that the term *solidos galleganos* in Leonese documents of the eighth and ninth centuries does not refer to these monetary systems. Documents show that from the eighth century until the early eleventh century the only coins that circulated in León were gold and silver coins from al-Andalus.

The first uniquely Leonese money seems to have been issued during the reign of Fernando I, who united Castile and León; but until Alfonso VI (1073–1109), there is no completely reliable data concerning the production of money in these kingdoms. There are several known types of *vellón* coins that were issued by Alfonso in León and Toledo. He also granted the Cathedral of Santiago de Compostela a license to mint coins to fund the construction of its church. His successor, Urraca (1109–1126), would make similar concessions to various monasteries, including Sahagún and San Antolín de Palencia. The monetary issues continued with Alfonso VII (1126–1157). With his death the kingdom separated again, with Fernando II succeeding him in León (1157–1188); Fernando issued gold coins in the region for the first time, a significant event in a territory whose circulating money consisted exclusively of *vellón* coins and gold coins of Arabic origin. This new currency was the Leonese *maravedí*, with a pattern similar to the Arabic *morabetín* and to Castilian

coins (the Alfonsine *maravedí*) that imitated the *morabetín*. The Leonese *maravedí* was exceptional in that it was the first gold coin of Christian appearance and Latin text minted in Western Europe; its Romanesque design is particularly notable. Alfonso IX (1188–1230) also issued the *maravedí*, and many new mints were established to issue *vellón* coins. In 1202 a coinage tax was introduced to compensate for the promise not to alter coin quality during a period of seven years. Alfonso IX was succeeded by Fernando III (1230–1252), who reunited the kingdoms of León and Castile definitively. From then on the uniqueness of the Leonese currency disappeared; a uniform Castilian-Leonese coin was introduced, whose only distinguishing mark was that of the mint, a few of which were located in the former kingdom of León.

The currency of León consisted basically of indigenous *vellón* coins and of Arabic gold coins. Several discoveries of coins originating from the other side of the Pyrenees show the importance of the pilgrim route of Santiago de Compostela throughout the Middle Ages.

COINAGE AND CURRENCY, MALLORCA

The only currency issued during the ancient era was the unique Punic coin on the island of Eivissa, which survived into the Roman age during Claudius I's reign (A.D. 41–54).

The medieval era begins with the issuing of Arabic coins during the *tā'ifa* period in Mallorca and Menorca, followed by Almoravide and Almohade currencies used until the Christian conquest of the islands.

After the conquest of Mallorca (1228), Jaime I introduced a coin of *tern* quality (25 percent silver), also used in Valencia. With the bequeathment of Mallorca to the king's son, Jaume II (1276–1311), an independent kingdom was created, incorporating in addition other territories like the *condados* of Rosselló and Cerdania, where the kingdom's capital, Perpignan, was located. Although the independent kingdom had to recognize the supremacy of Catalonia-Aragón, it developed its own monetary system inspired by French models. This system was established between 1300

and 1310 with three basic currencies: the gold *real*, the silver *real*, and the *dobler*, made of *vellón*. An erroneous exchange rate between the silver real and the vellón coin caused the speculative emigration of the Mallorcan silver coin, with a foreign silver coin circulating in its place. The gold coin was minted in small quantities, making it almost of more symbolic worth than monetary.

The last monarch of the independent kingdom, Jaume III (1324–1343), moved the mint to Perpignan, where he issued coins modeled after Italian and French coins (the *florín* and the *gros tornés*, respectively), as well as exclusively Mallorcan models.

Pedro III (1336–1387) recovered the kingdom in 1343, maintaining the Mallorcan monetary system for a while. With Juan I (1387–1396) and Martín I (1396–1410), the currency was aligned with that of other territories in the Catalan-Aragóense kingdom, with the introduction of the gold *florín* and the reconciliation of the silver real's value. The indigenous vellón coin, however, continued to be used. With Fernando II (1479–1516) the gold *ducado* was adopted, as it was in the rest of the kingdom. To solve the problems with the silver real, coins of low monetary value were established to make their exportation more difficult.

COINAGE AND CURRENCY, MUSLIM

No sooner had the Muslims begun their conquest of the Iberian Peninsula in 711 than they struck coins bearing the message of their faith. Depending on relations with the caliphate (Umayyad, 660–750, and Abbasid, 750–1258), as well as other factors, these coins vary, in legend and medium (gold, silver or, less frequently, copper), from age to age according to the following chronological schema:

1. The Emirate, 711–929
 - a) The period of domination by the caliphate of Damascus, 711–750

- i) Latin-Muslim coins, 711–718 (gold);
 - ii) Arabic coins (gold to 722, silver thereafter)
- b) The period of the independent emirate, 750–929 (silver)
2. The caliphate of Córdoba, 929–1031 (predominantly silver)
3. The *ṭāʾifa* rulers, 1031–1094 (predominantly silver, some gold)
4. The first Berber rule: the Almoravids, 1094–1143 (predominantly gold, some silver)
5. The second Berber rule: the Almohads, 1143–1212 (predominantly gold, some silver)
6. The Naṣrids of Granada, 1238–1492 (gold, silver, and copper)

It is obvious from this schema that as soon as the Muslims of the Iberian peninsula severed their relations with the caliphate of Baghdad shortly after 750, the supply of gold dried up and the autonomous rulers of al-Andalus had to depend on silver and copper as the metal of fiscal exchange. Gold returned to al-Andalus with the arrival of the Almoravids.

The standard weight of the golden *dinar* was 4.25 grams, although many pieces fell short of this ideal. The Almohads reduced the standard weight to 2.3 grams but struck a dinar double the weight, averaging 4.50 grams (known to modern numismatists as the *dobla*). This double dinar was also adopted by the Naṣrids.

With the exception of the coins of the Almohads and the Naṣrids, the distribution of the legends on the obverse and the reverse was more or less uniform: an inscription of several lines occupied the field and a circular legend was inscribed around the perimeter. On one side (the obverse) the legends (field and circle) were primarily religious in nature, while on the other side (the reverse) they appertained to details of state: the name or title of the ruler, in the field, and date and place of the mint, along the circular margin. Variations from this standard were employed as necessitated by the changing political scene.

The religious legends showed a great degree of minting conservatism. Passages were drawn from the Qurʾān to convey the basic tenets of the faith. The legends on the earliest coins known to us so far were in Latin and contained a condensed translation of some of the Arabic legends appearing on contemporary coins of the Muslim rulers in Syria, at that time the political heartland of Islam. The circular legend on the obverse of the earliest of these coins (dated A.H. 93/A.D. 712 and Indiction X) reads as follows: *INN DINN D SNSDSSLNDSA (IN Nomine Domini NoN Deus NiSi Deus SoLuS Non Deus Alius)*, condensing the translation of *bism Allāh lā ilāha illa Allāh waḥdahū lā ṣarīka lahu* (“In the Name of God. There is no deity

other than God, alone, without compare"). The circular legend on the reverse identified the mint as *SPN* (Spania). Shortly thereafter (A.H. 98/A.D. 717), Arabic legends replaced the Latin and the name *Spania* was replaced by *Al-Andalus*. The circular legend on these Arabic coins affirmed the prophethood of Muḥammad, citing Qur'ānic passages that say "Muḥammad is the Apostle of God. He sent him with the guidance and the true religion despite the aversion of disbelievers." The religious legends were changed with the arrival of the Almoravids. The new legend in the field (on the obverse) contained the testimony of faith, "There is no deity other than God, Muhammad is the Apostle of God." Far more interesting, and inadvertently alarming to the Christians of the peninsula (the legend was initially directed against the Shi'a Muslims of North Africa), was the circular legend in which the Qur'ānic verse was quoted, "Who so seeks a religion other than Islam, it shall not be accepted from him and in the Hereafter he shall be among the losers." The change in the distribution of the legends on the coins of the Almohads and Naṣrids led to an abandonment of earlier circular religious legends in favor of an occasional selection of other Qur'ānic statements or none at all.

The Muslim coinage of al-Andalus circulated throughout Christian Europe. This is particularly true of the period of the Almoravids and the Almohads, when gold was used extensively in minting coins. Having tapped the sources of gold in West Africa, these Berber dynasties minted coins that became the envy of their Christian enemies to the extent that Rome demanded that church dues owed by several European ecclesiastical provinces (including England, France, Germany, and Italy) were to be paid in *morabetinos*, the golden dinars minted by the Almoravids or their Spanish Christian imitators (Alfonso VIII), or in *doblas*, the double dinars of the Almohads.

COINAGE AND CURRENCY, NAVARRE

Currency was introduced in Navarre by the ancient Iberians, who minted silver and gold; Roman currency was subsequently issued. During the Visigothic era, however, we do not encounter monetary workshops,

perhaps because the region, populated by the Vascons, was involved in constant rebellion against the Visigothic monarchy.

The production of currency was renewed with Sancho el Mayor (1000–1035), who issued coins of *vellón* with inscriptions reading IMPERATOR and NAVARA. The region's domination of Aragón is manifest in the coins that existed during the reign of Sancho's son and successor, García (1035–1054), which include some coins reading NAVARA and others reading ARAGON. This dependency shifts with Sancho Ramírez de Aragón, who took over the Aragónese hegemony in 1076. With Sancho and his successors, Pedro (1094–1104) and Alfonso (1104–1134), we find some coins with the inscription NAVARA in the name of Sancho, and others with ARAGONENSIS that could easily have been produced in Navarre. The Arabs of the *ṭā'ifa* period (eleventh century) issued money in Tudela.

With García el Restaurador (1134–1150), Navarre regained independence, and the inscription NAVARA reappeared on the *vellón* coins.

The Navarrese coins came to be known as *sanchetes* because of the proliferation of kings named Sancho. The sanchete was circulated exclusively in Navarre, except during the period from 1120 to 1250 when the Almoravide *morabetín* circulated to some extent.

The French dynasty (1284–1349) introduced the *torneses* into Navarrese circulation; they were coins of a value inferior to the sanchete. The representative classes ended up agreeing to accept the torneses as comparable to the sanchete, explaining the expression "sanchetes y torneses mezclados" found in documents. The *vellón* coin was kept in circulation from 1250 until the second half of the fourteenth century, when the gold *florín* (initially the Aragónese version) began to gain prominence.

In this middle period, and despite the various monetary issues made by Carlos el Malo (1349–1387), there are no other species of coin detected other than the *vellón*, which was now called the *carlín*. Initially, the carlín was of high purity (*carlines blancos*), but was soon issued in a lower purity worth half the value of the sanchete (*carlines prietos/negros*).

In the fifteenth century the scope of the gold coin grows and is eventually used in almost half of all documented payments. During this period, indigenous gold coins began to be circulated; we also find the first references to silver carlines.

With Fernando II (1513–1516), the circulating currency would follow the model of the gold *ducado* and the silver *real*; the *vellón*, however, would con-

serve its own Navarrese design throughout the Modern Era.

COINAGE AND CURRENCY, VALENCIA

Ancient currencies in Valencia consisted of Iberian issues, first with Punic influence, then Roman. After a considerable gap in monetary production, the Visigoths issued coins in Sagunto and Valencia, but in negligible quantities. Monetary production was renewed decisively with the Arabs, starting specifically with the age of the *tā'ifa* (eleventh century). The Muslims issued gold and silver coins in the city of Valencia and also minted coins in Denia, Alpont, Elda and Játiva.

After the conquest of Valencia, Jaime I of Catalonia-Aragón created the *reial de Valencia* (1246), shared by the kingdom of Mallorca. It was of the same purity as the *tern* (25 percent silver), with a value equivalent to the coins of Barcelona and of Aragón. With Jaime II (1291–1327), money was issued in Alicante, a former Castilian territory conquered by Murcia. When it was incorporated into the kingdom of Valencia, Alicante adopted the Valencian currency.

Pedro III (1336–1387) first issued the gold *florín* in Valencia, but until Juan I (1327–1396) there was no coin minted with a silver content higher than the *croat* of Barcelona. This difference would disappear with Martín I (1396–1410).

With Alfonso IV (1416–1458) the purity of the *vellón* was reduced to 12.5% silver. Alfonso also issued the short-lived *timbre d'or*.

Fernando III (1479–1516) minted *florines* in Valencia, but also introduced the *ducado* and kept the *real* and other coins in their previous metallic content. Valencia issued gold abundantly during his reign and during that of Carlos I, who abandoned the *ducado* model, opting instead for the *escudo*.

COLÓN See COLUMBUS, CHRISTOPHER

COLUMBUS, CHRISTOPHER

Christopher Columbus is seldom associated with late medieval European thought. Yet his written work and other written sources suggest that he was informed by an intellectual tradition resting more heavily on ancient, medieval, and scholastic authors than on the authority of experience one associates with the Modern Age. Columbus is in the company of scholastics who, between the twelfth and seventeenth centuries, strove to systematize knowledge by reconciling Aristotle and other pagan authors with Christian doctrine. If this literary influence is not explicit in his *Diario* or much of his early writing, it would become so in response to protests voiced by his enemies in the Spanish court for his administrative tactics in Hispaniola and for his

Ghirlandaio, Ridolfo (1483–1561). Portrait of Christopher Columbus. Copyright © Scala/Art Resource, NY. Museo Navale di Pegli, Genoa, Italy.

failure to meet the expectations fueled by the enterprise of the Indies. The list of authors directly or indirectly cited, or alluded to, by Columbus is too extensive to mention here, but striking examples of his reliance on the *auctores* sanctioned by scholastics may be found in his *Letter of the Third Voyage* (1498) and his *Libro de las profecías* (1501–1502), a compilation and commentary of mostly scriptural passages that he thought signified his discovery as the final stage in completing God's apocalyptic scheme. Columbus was strongly influenced by Franciscan eschatology, particularly by the ideas of the Calabrian Joachim of Fiore friar.

No record exists of Columbus's formal schooling except for the assertion, forwarded by the bibliophile Hernando Colón (Fernando Columbus) in the apologetic biography of his father, that Columbus had attended the university in Pavia. Columbus was probably an astute autodidact who absorbed the theology and philosophy of his time from the ecclesiastic and scientific communities in the courts of Portugal and Spain, and, particularly, from the important monastic learning centers of Santa María de la Rábida and Nuestra Señora Santa María de las Cuevas in Spain.

The earliest and most influential accounts of the admiral's learning are provided by Hernando and by the Dominican friar Bartolomé de las Casas, Columbus's most devoted early biographer, in his *Historia de las Indias* (completed in 1559). Both biographers—the latter follows Hernando's lead almost to the letter—offer a list of authors who appear to have kindled the admiral's wish to cross the ocean. According to Hernando and las Casas, Columbus's belief that the greater part of the globe had been circumnavigated and that only the space between Asia's eastern end and the Azores and Cape Verde Islands remained to be discovered comes from the Alexandrine astronomer Ptolemy, the Greek geographers Marinus of Tyre, and Strabo, the Greek physician and historian Ctesias, Onesicritus and Nearchus, respectively captain and admiral to Alexander the Great during the Macedonian campaign in India, the Roman historian Pliny the Elder, and the Arabic astronomer Alfraganus. Likewise, his belief that the distance between continents was small rests, in their view, on the works of Aristotle, the Córdoba astronomer Averröes, the Roman philosopher Lucius Annaeus Seneca, the Roman poet and grammarian Gaius Julius Solinus, the Venetian Marco Polo, the fictional author Sir John of Mandeville, the French theologian and natural philosopher Cardinal Peter Aliacus, and the Roman writer Julius Capitolinus. Las Casas, clearly more schooled than the discoverer, adds a list of Christian and pagan *auctores* from whom Columbus might have persuaded himself of the plausibility of his project. Whether Columbus was as learned

as Hernando and las Casas claim is still the subject of debate. Columbus probably owes his acquaintance with many *auctores* in the scholastic tradition to encyclopedic works such as Peter Aliacus's widely read *Ymago mundi* (1410–1414) and Pliny the Elder's *Historia naturalis*.

The most concrete evidence of Columbus's learning are the incunabula he is known to have possessed. A few of these volumes, held in the Biblioteca Colombina of Seville, contain abundant postilles by his hand, a number of which betray firsthand knowledge of numerous other works. The following volumes have long been identified as his: an extensive geographical treatise by the humanist Aeneas Sylvius Piccolomini (Pope Pius II), *Historia rerum ubique gestarum* (1477); Peter Aliacus's *Ymago mundi* (1483); Francesco Pipino's Latin translation of Marco Polo's *Il milione: De consuetudinibus et conditionibus orientalium regionum* (1485); and the manuscript of the *Libro de las profecías* (dated 1504). Others identified in 1891 as Columbus's are the following: Christophoro Landino's Italian translation of Pliny the elder's work: *Historia naturale* (1489); Abraham Zacut's *Almanach perpetuum* (1496), which contained a tabulation of planetary aspects and may have helped Columbus predict an eclipse on Jamaica (1504); Alfonso de Palencia's Spanish translation of Plutarch's *Parallel Lives (Vidas de los ilustres varones*, 1491); a manuscript of the anonymous fifteenth-century *Concordiae Bibliae Cardinalis*, which may have furnished Columbus with quotes for his *Libro*. Albertus Magnus's *Philosophia naturalis* (Venice 1496), also known as *Philosophia pauperum*, containing the saint's commentaries to the works of Aristotle's cosmology: *Physics*, *On the Heavens*, *Meteorology*, *On Generation and Corruption*, and *On the Soul*; St. Antoninus of Florence's confessional guide, the *Sumula confessionis* (1476); and a fifteenth-century palimpsest of Seneca's tragedies containing the *Medea*, from which Columbus extracted a passage foretelling the discovery of a new orb.

Las Casas judged the *Ymago mundi* to be the primary source for the enterprise of the Indies. Peter Aliacus wrote this series of treatises in preparation for the Council at Constance, which ended the Western Schism (1414). The *Ymago mundi*, essentially an astrological work, includes a systematic account of the geocentric world, incorporating ancient geoethnography into the theoretical frames of Aristotle's physics and Ptolemy's *scientia stellarum*. Although this work's influence on Columbus has been discussed primarily on the basis of its place in late medieval geoethnography, its central purpose was to describe the mechanics of the natural world and to chart out the motion of the *machina mundi* over time. (The "machine of the world" in motion represented apocalyptic time unfold-

ing.) By this method, Peter Aliacus hoped to discern the historical status of the religious crisis at hand in relation to the rise of the Antichrist and the dawning of the end of time. This eschatological work illustrates the union of Christian theology and Aristotelian science, that characterized intellectual production in the Latin West between the twelfth and seventeenth centuries. Columbus owes much of his thought to this tradition.

COMMUNICATION

In comparison to the Modern Age, the means of communication in Medieval Spain were quite simple. One communicated orally to a person in one's immediate vicinity, or in writing to someone at a distance. Oral communication, especially if it passed to several persons, was subject to considerable alteration and distortion. The transmission of news of the broader world to those living in the comparative isolation of rural villages was likely delayed by months or even years. Communications that were thought to embody permanent principles, concessions, rights, or privileges were often recorded in writing. A major obstacle to written communication was the illiteracy of the vast majority of the Iberian population. Written texts required someone, a cleric usually, to read them. More than likely, most people never communicated in writing to anyone. Written communication was restricted in practice to the cultural elite of kings, clergy, nobility, and the urban patriciate. The transmission of communications, whether oral or written, had to overcome both geographical and human obstacles such as inadequate roads and bridges, swollen rivers, mountains, foul weather, highwaymen, brigands, and grasping innkeepers.

The geographical considerations included the fact that the Pyrenees Mountains cut Spain off from northern Europe except by way of the western pass at Roncesvaux and the eastern pass at Le Perthus. On the other hand, the Mediterranean Sea, which bathed much of the eastern and southern coast of the Iberian Peninsula, served as a link with Italy and North Africa. The straits of Gibraltar facilitated travel and communication between Andalucía and Morocco. The Atlantic to the west gave Spain and Portugal access to the wider world of Asia and America in the closing century of the Middle Ages. Within the peninsula, mountain ranges running in an east-west direction intersected the central *meseta* (plateau), whose height restricted easy access from the coastal regions. The great rivers served as routes of travel and communication: the Duero (485 miles), the Tagus (565), the Guadiana (510), and the Guadalquivir (512) all flowed westward to the Atlantic while the Ebro (465 miles) proceeded eastward to the Mediterranean.

The Romans built a network of 13,000 miles of roads to facilitate the passage of troops, but these routes also served the needs of travelers and merchants. The Via Augusta, following the coast from Cádiz to Tarragona and thence to Gaul and Italy, was the principal highway. During the Visigothic era the road system began to deteriorate but the old roads continued to serve the needs of Muslim and Christian armies in succeeding centuries.

Aside from face-to-face interaction the means of communication were quite varied. In the caliphal epoch there was a regular postal service using carrier pigeons. In the Christian states *porteros* carried oral or written orders from the king. Merchants and soldiers in all ages, monks such as those of the French orders of Cluny and Cîteaux in the eleventh and twelfth centuries, Franciscan preachers and missionaries in the thirteenth century, and pilgrims to Santiago de Compostela especially from the eleventh century onward, as well as ransomers (*alfaques* or *exeas*) and escaped slaves all could carry verbal or written messages. Ambassadors from Constantinople and the Holy Roman Empire visited the court of the caliphs at Córdoba. The rulers of Christian Spain also sent envoys there and later to the *tā'ifas* or petty kings, and to the kings of Granada. From the eleventh century onward papal legates visited the peninsula with comparative regularity, while Spanish bishops often journeyed to France and to Italy. During the epoch of the crusades various Spaniards are known to have traveled to the Holy Land. The Christian rulers were extraordinarily peripatetic throughout the medieval era, so the movement of the royal court from one place to another was a major vehicle for the transmission of information and news of both a public and a private character.

Few written communications from the Visigothic and Islamic periods have survived, but the number from Christian Spain increased steadily from the tenth century onward. Among the extant documents are royal letters of different types, papal and episcopal letters, some private letters, and many private charters. In addition, stories and tales circulated orally and were then recorded in writing. These included the poems of Berceo (ca.1180–ca.1250), the *Cantar de Mio Cid*, and the *Cantigas de Santa María*, a treasure trove of miracles attributed to the Virgin Mary. Stories were also communicated in the sculptural programs of the great cathedrals.

Instantaneous communication over long distances was obviously not possible in Medieval Spain. Days, weeks, and months often passed before messages were delivered. The rapidity of communication depended on the urgency of the matter. Eulogius of Córdoba (c.859), for example, made a lengthy journey to Navarre in search of his brothers, who had gone on a commercial venture. The pilgrimage to Santiago took months because it was also an occasion for tourism and sightseeing. Preparing to challenge the Almohads, a Christian army departed from Toledo on 20 June 1212 and arrived at the battlefield of Las Navas de Tolosa on 13 July, covering a distance of about 112 miles in about twenty-three days, or at a rate of nearly 5 miles a day. On the other hand, Fernando III, contending with heavy rains and floods, made a forced march of nearly 300 miles from Benavente in León to Córdoba from mid-January to 7 February 1236. His rate of travel was about 14 miles per day. Jaime I of Aragón sailed to Mallorca on 5 September 1229, encountered storms, but arrived at Palma, about 140 miles away, on the night of 8–9 September. A fleet sent by Alfonso X from Cádiz to Salé on the Atlantic coast of Morocco arrived on 8 September 1260 about four days after its departure. Instructions issued by Pope Nicholas III to his legate on 23 March 1279 were delivered to the Castilian court in May. The itineraries of the Christian kings can be determined for the High and late Middle Ages and convey some idea of the pace of travel and communication.

COMPOSTELA, MUSIC RELATING TO

Discussions of music in the vast popular and scholarly literature dealing with the Jacobean pilgrimage have focused, to a greater or lesser extent, on its spiritual

and recreational roles. Throughout the centuries, music provided not only spiritual sustenance during the arduous journey to Compostela, but also pleasurable diversions at particular stopovers, where the weary were entertained by *juglares* (minstrels), or where they observed and even participated in local musical festivities. In all, the pilgrims' exposure to a variety of regional traditions and intermingling with fellow itinerants from other countries, enriched their musical experiences along the principal routes of the *camino francés*, which, in Spain, converged at Puente la Reina and continued along the *Camino de Santiago*, passing through present day Huesca, Navarra, La Rioja, the uppermost part of Castilla la Vieja, and Galicia.

One of the earliest accounts concerning the musical activities of pilgrims upon their arrival in Santiago de Compostela can be found in book 1 (fol. 78) of the mid-twelfth-century *Liber Sancti Jacobi*. There a witness expresses his joy and wonderment upon observing the varied groups of pilgrims (Germans, French, Italians, et al.) who have gathered in the basilica bearing candles to maintain an all-night vigil before the altar of St. James. Among their instruments, he mentions citterns (*citharis*), lyres (*liris*), kettle drums (*timphanis*), flutes (*tibis*), small shawms (*fistulis*), trumpets (*tubis*), harps (*sambrecis*), fiddles (*violis*), and hurdy-gurdys (*rotis Brittanis vel Gallicis*). Some sing to the accompaniment of psalteries (*psalteriis*), and others to diverse instruments (*diversa generibus musicorum*), and conversations and songs in languages "from all the climates of the world" could be heard.

One can imagine the countless number of personal accounts alluding to songs, dances, and musical instruments that were lost to oblivion, including, according to Anglés, thirteenth- and fourteenth-century collections of religious songs from the basilica in Santiago. We have a general idea of the vocal and instrumental genres that were familiar along the pilgrim routes from the twelfth through seventeenth centuries (ranging from the courtly and popular traditions of mainly French origin—*chansons de geste*, *cantilenas*, *rondeaux*, *virelais*, *cossantes*, songs with refrains, and so forth—to the secular and religious *romances* and *vilancicos*, and other orally transmitted folk genres that continued in popularity through the Spanish Baroque). Yet, it was the vast hymn repertoire, together with the favorite *organa* and *conducti* from the liturgical tradition that sustained the journey's sacred character. Among the numerous song anthologies (*cancioneros*) from the aforementioned regions that were published since the early eighteenth century, one can find a wealth of tunes associated with the pilgrimage.

The earliest source for music at the cathedral is the *Liber Sancti Jacobi* or *Codex Calixtinus* (housed

at the Archivo de la Catedral and falsely attributed to Pope Calixtus d. II, (d. 1124). It is also referred to as the *Liber Beati Jacobi*. Its five books were compiled primarily by French and Italian clerics about the year 1140, undoubtedly as a product of the Cluny reform. Surprisingly, only the first contains the liturgical texts and music (notated on fols. 101^v through 193), about 90 percent of which is monodic, conforming to the Gregorian and comprising the “numerical” offices (seven of them, including antiphons and responds), masses, and processions for the feast of the apostle St. James, and hymns. There is also a votive mass titled “de los Peregrinos.” Additional items include prosas and hymns and twenty-two two-part and one three-part *organa* (the renowned *Congaudeant catholici*, actually a Benadicanus trope), based upon Gregorian tenors, which are related stylistically to those from St. Martial. They are notated in Franco-Norman neumes on four-line staves. While their pitches are discernable, they lack rhythmic precision. A later copy, in Aquitanian neumes, of the monophonic items was made in 1173 by Arnould du Mont (Ripoll 99, housed at the Archivo de la Corona de Aragón).

In the *Liber* there are two monodic hymns bearing markedly popular traits: “Ad honorem Regis summi” (fol. 190^v), attributed to Aymery Picaud, author of the Pilgrim’s Guide (book 5), and “Dum Paterfamilias” (fol. 193^v), more familiarly known as the *Canto de Ultreya*. According to López-Calo, the former is pronouncedly Galician in inspiration, while the latter, judging from its orthography and notation (Acquitanian), appears to predate the Codex and was probably incorporated in its initial binding. However, controversies abound concerning its transcription and the rendering of its supposed double refrain “*Primus ex Apostolis . . .*” and “*Herru Sanctiago . . .*” Among the numerous transcriptions, that of López-Calo bears considerable attention.

CONGO, KINGDOM OF

An important Bantu kingdom and the first political entity of consequence encountered by the Portuguese in their explorations down the African coast during the fifteenth century. It also represented the first of Portugal’s diplomatic and missionary successes and an important source of trade, primarily in slaves, because the region produced no precious metals, though it did provide some ivory in exchange for the desired metalwares, cloth and beads provided by the Portuguese. Its importance diminished as the Portuguese pressed on farther south and ultimately focussed their attention on Angola and India.

The first contact between the Portuguese and the Bantu kingdom took place in 1482 or 1483, when three caravels under command of Diogo Cão anchored off the Congo estuary in the Sonyo region. Although the population could not understand interpreters brought from the Guinea region, contacts were friendly and Cão dropped off an embassy bearing gifts to make its way inland to the sovereign of the region, the Mani Congo, while Cão continued his explorations down the coast. On his return, the emissaries had still not returned, and as a precaution, he took four hostages back to Portugal as a guarantee for his own men’s safety; in Portugal, the hostages were feted, shown about, and taught some Portuguese.

Cão returned to the Congo the following year and liberated the Sonyo foursome; the Portuguese ambassadors also turned up and had been equally well treated. The Mani Congo, Nzinga Nkuwu I, then sent gifts to João II, accepted missionary priests and eventually was baptized (in 1491) as João I of the Congo. Along with priests, João II sent skilled workmen, such as blacksmiths and masons,—and even women to teach the domestic arts. Nzinga Nkuwu ruled until 1506 and was succeeded by his son, a devout Catholic. For a time, the two nations entertained cordial and fraternal relations.

But two circumstances militated against relations continuing on such an idyllic and cordial basis. One was the turning of Portuguese interests elsewhere—to Angola and to India. Repeated requests for more aid and embassies by Nzinga Nkuwu’s successor, Nzinga Nvemba (ruling as Afonso I, 1506–c.1543), were ignored, while the Portuguese residents at court conducted themselves in an overbearing and un-Christian

manner. Second, the economic relations between Portugal and the Congo were dependent wholly on the slave trade; even there the Portuguese found better sources of supply in Angola, to the south. Though Congolese kings remained nominal Christians until the seventeenth century, the once promising relationship steadily deteriorated from the reign of Manuel I.

CONSEJO *See* TOWNS

CONSEJO DE ARAGÓN

The Consejo de Aragón, a seven-member royal council instituted in 1494 by Fernando and Isabel, administered the various realms that composed Fernando's personal patrimony, the medieval Crown of Aragón. Part of the bureaucratic evolution of Castile from a medieval monarchy into a modern state, the consejo de Aragón was one of several councils established to govern the vast Castilian territorial possessions in Europe and the New World during a period of rapid colonial expansion.

Conceived of as the administrative link between the territories of the former Crown of Aragón and a frequently absent king, the Consejo de Aragón was essentially a refurbishment of the former Aragónese Curia Regis. The Consejo's structure was based on delegation of royal authority in general and, in particular, the Aragónese institution of the viceroy, who was used to govern its Mediterranean territories. It was composed of a *vice-canciller* (vice-chancellor) and a *tesorero-general* (general treasurer) who presided over five regents, the viceroys of Aragón, Catalonia, Mallorca, Sicily, and Valencia. Located in Castile, the members of the consejo advised the king concerning matters relevant to its governance and transmitted his orders to the viceroys in charge of each realm.

The division of bureaucratic functions roughly paralleled the structure of Castilian government under Fernando and Isabel. Foreign affairs, taxation, fiscal policy, and military matters were handled by the Consejo Real (Royal Council) in Castile, while the Consejo de Aragón was responsible for coordinating the work of local and regional institutions. Although in theory the two kingdoms were unified, in fact no attempt was made to fuse the administration of the two crowns. The

five viceroys were granted substantial freedom in their supervision of regional administration of justice and municipal government, which could vary widely from place to place. Thus, the veneer of a unified Castilian state was applied to what remained fundamentally a federation of regional and local governments.

The Consejo de Aragón illustrates the paradox of the government of Fernando and Isabel: a drive toward centralization offset by the preservation of traditional regional institutions. Owing to the representative character of the Aragónese institutions, the monarchy was limited by constitutional constraints in these five territories, unlike in Castile where it was more authoritarian. As a result, the Castilian monarchy ruled over a pluralistic state, an alliance of a series of separate patrimonies each governed in accordance with their own distinct laws.

CONSEJO DE LA SANTA HERMANDAD

The Consejo de la Santa Hermandad, formed in 1476 by Fernando and Isabel, was the unified central council in Castile that supervised the actions of the *santas hermandades* (holy brotherhoods), local militias that served as a combined police force and judicial tribunal. The consejo collected the taxes, maintained order among the militias, and mediated jurisdictional disputes. Presided over by the bishop of Cartagena, the consejo consisted of a supreme commander of the militias, a chief administrator, an attorney general, an advocate general, and the constable of Castile. Because the members of the consejo were direct representatives of the crown, and thus less likely to fall under the influence of a local magnate or town council, the local hermandades became a highly effective fighting force in the service of the monarchy.

The evolution of the Consejo de la Santa Hermandad is typical of how Fernando and Isabel strengthened a traditional medieval institution to meet their new needs. Local hermandades had existed since at least the mid-thirteenth century. Castilian towns were granted wide powers to form temporary militias composed of armed horsemen and *cuadrillas* (squads of archers) to patrol rural areas during periods of unrest. Each town provided a quota of troops and had its own cuadrilla to respond to the hue and cry and to pursue the malefactor to the limit of the town's jurisdiction, where the pursuit was taken up by the hermandad of the neigh-

boring town. Their jurisdiction included all crime committed on the roads, including robbery, murder, arson, rape, burglary, blasphemy, counterfeiting, and acts of rebellion against the crown. An *alcalde* presided over the court of justice, pronounced justice, and assessed penalties. At first strictly ad hoc groups, by the late fourteenth century the hermandades had become a permanent fixture of the Castilian countryside.

The basic administrative structure of the hermandades was formalized and strengthened at the *cortes* (parliament) of Segovia in 1386, but during the civil strife of the fifteenth century, they fell prey to factionalism and lost much of their effectiveness. In 1467 Enrique IV, with the ordinances of Castronuño, organized the local militias into eight provinces under a supreme commander; he was, however, unable to effectively exert royal authority over them.

During the War of Succession (1474–1479) that followed Enrique's death, Fernando and Isabel turned to the hermandades for military support. Utilizing the hermandades as a temporary expedient to deal with an acute emergency, the monarchs transformed local militias into an army in the service of the crown. At the *cortes* of Madrigal in 1476 the Consejo de la Santa Hermandad was established, local jurisdiction was widened, and every city, village, and hamlet was ordered to join and to pay taxes to support them. During the Granada war (1483–1491) the consejo became a powerful semipermanent institution and the *cuadrillas* grew in number, forming an important component of the troops involved in the final battle of the reconquista.

After 1492 the Consejo's activities declined sharply and the militia never again saw combat. Nevertheless, the taxes continued to be collected and the consejo's mandate was renewed until 1498. By then, general peace prevailed and the consejo was dismantled. The rural police forces remained to provide justice and safety in the countryside, and the taxation for the archers and local administration continued long into the modern era.

CONSEJO DE LA SUPREMA Y GENERAL INQUISICIÓN See INQUISITION

CONSEJO DE LAS ÓRDENES

The Templars and Hospitallers, religious orders that became participants of the Spanish Reconquest by the early twelfth century, were joined at much the same time by a number of indigenous crusading orders in Castile, Aragón, and Portugal. The most important of these were the orders of Calatrava, Alcántara, and Santiago. In exchange for their role as the first line of defense for Christian Spain against Muslim Spain, the military orders attained legal autonomy and wealth which, by the thirteenth century, had caused the jealousy of sovereigns and commoners in all the Iberian realms. With the dissolution of the Templars in 1312, the ultimate fate of the Spanish crusading orders was sealed. As the Muslim threat to Spain fell back to the truncated kingdom of Granada, the military orders in Castile, thoroughly dominated by the kingdom's nobility, proved an even greater threat to royal autonomy. The first blow against aristocratic control of the Castilian orders took place in 1476 when Isabel I claimed the vacant mastership of the Order of Santiago and eventually granted it to her husband Fernando II of Aragón. Following the same procedure with the orders of Calatrava and Alcántara, Isabel's government had assumed administration of the three orders by 1495 with the creation of the Council of the Orders (*Consejo de las Ordenes*). This royal council, staffed with a president and five judges largely drawn from the orders' former leadership, administered the lands of the orders and adjudicated all suits that involved this property. The council survived as a royal agency until it was abrogated by the Constitution of 1812.

CONSEJO REAL

The single most important governmental institution in Castilian government in the later Middle Ages and early modern period, the *Consejo Real* was a council separate and distinct from the royal bureaucracy normally in charge of governance. Members of the consejo routinely dealt with all aspects of government: they supervised the work of local government, administered law in their role as the supreme court of justice, and advised the king on whom to appoint to high office and whom to reward with royal favors.

Created in 1385 by Juan I (1379–1390), the Consejo Real was conceived originally as a permanent advisory body representing the *cortes* (parliament) and

was composed of twelve members drawn from the three estates: nobility, clergy, and townspeople. Baronial interference, incompetence, and self-interest threatened the integrity of the consejo, prompting Enrique IV (1454–1474) in 1459 to reform the composition of the membership. Henceforth eight of the twelve members were to be *letrados* (legists) qualified in administration.

During the reign of Fernando and Isabel (1474–1516) the Consejo was transformed into a truly effective instrument of royal authority capable of acting independently on its own. In need of an institution to supervise the governance of their newly acquired territories in Europe and the New World, at the cortes of Toledo in 1480 Fernando and Isabel greatly expanded the power, functions, duties, and prerogatives of the Consejo Real so that many important matters previously handled personally by the monarchs fell under its jurisdiction. Five committees were established to implement royal policy concerning justice, foreign policy (after 1526, known as the Consejo de Estado, 1526), finance (after 1523, the Consejo de Hacienda), pacification of the countryside (the Consejo de la Santa Hermandad, dismantled in 1498), and the territories that composed Fernando's patrimony—the medieval Crown of Aragón (formalized as a distinct entity in 1494). In 1489 a president was appointed to act in place of the often-absent, itinerant monarchs.

The domination of the consejo by the legal profession was complete by 1493, when it was determined that all members be *letrados* with at least ten years' study of law at a university. The Consejo Real, once dominated by a military aristocracy armed with their own agenda, had been transformed into a modern institution, staffed by *letrados* who owed their jobs, and thus their loyalty, first and foremost to the monarchy.

CONTINUATIO HISPANA See MOZARABIC CHRONICLE OF 754

CONVERSOS

Jews who converted to Christianity were called *conversos* ("converts", converted Muslims were referred to as *tornadizos*, or "renegades").

With the exception of individuals who converted entirely on their own at different periods (e.g., Pedro Alfonso), the conversion of Jews may be classified into four general periods.

The Visigothic Era

The first decree of compulsory baptism was issued by Sisebut in 613, a decree that it is often erroneously claimed met with the disapproval of Isidore of Seville. However, Swinthila permitted those Jews to return to their faith, but this was set aside by the next king, Sisenand, in 633. Once again, under Khintila (638), the Sixth Council of Toledo ordered the baptism or expulsion of all Jews. This seems not to have entirely worked, however, for Reccesvinth (653) had to renew the decree and again force baptized Jews to sign an agreement to abide by the Christian faith. Finally, in 681 Erwig renewed all the anti-Jewish measures, which again demonstrates their ineffectiveness, but the Jews were saved from total disappearance by the invasion of the Muslims in 711.

The "Pogroms" (1391)

Jewish life under both the Muslims and the Christians flourished with little or no hostile activity or attitudes until the disastrous Trastámara civil war brought new forces to power in Castile in the late fourteenth century. In spite of the general and official tolerance of Jews also in the Church, some elements of the minor clergy were nevertheless sometimes hostile. This was the case with Ferrán Martínez, an archdeacon of Seville, who in the summer of 1391 aroused mobs to riot against the Jews. Synagogues in Seville were burned and the Jews robbed, and this soon spread throughout all of Spain. Some Jews were actually killed, more were robbed and their synagogues destroyed. In spite of the most vigorous efforts of the kings to stop the attacks and to punish the perpetrators, the damage had been done. Thousands of Jews, apparently fearing yet worse to come, or acting in despair at this unprecedented attack, converted to Christianity. Some Jewish communities ceased to exist entirely, and others, including such notable ones as Barcelona and Seville, became so depleted and impoverished as to virtually cease functioning until the fifteenth century.

Even prior to these events, the sudden conversion of the rabbi of Burgos, Solomon ha-Levy, along with his sons and other relatives (his wife converted later), was an event of such magnitude that it sent shock waves throughout the entire Jewish population. Attaching himself to Benedict XIII, the anti-Jewish pope of Avignon recognized by Spain, Solomon received a thorough education in Christian theology and quickly

became the bishop of Burgos as Pablo de Santa María. His son Alonso de Cartagena became first bishop of that see, and then succeeded his father in Burgos. The conversion of so prominent a family, all of whom then became illustrious writers and more or less virulent opponents of Judaism, made a tremendous impression. Joshua ha-Lorqi, an important Jewish scholar and protégé of the former rabbi, converted under his influence and became Jerónimo de Santa Fe, a major anti-Jewish polemicist. Other less prominent Jews were equally affected.

Vicente Ferrer and the Tortosa Disputation

The activities of the Dominicans and the Franciscans in attempting to convert the Jews date back to the thirteenth century. Having faced a temporary setback after the Barcelona Disputation, when their unfounded charges of “Jewish blasphemy” angered Jaime I, they saw their opportunity in the fourteenth century with renewed missionary efforts. However, it was the charismatic preaching and fanatical zeal of one man, Vicente Ferrer, that had the desired results. In the early years of the fifteenth century he marched throughout Spain, tirelessly exhorting the masses to religious reform and the Jews to conversion. Not content with that, he convinced the regents of Castile, Queen Catalina and Fernando de Antequera, to enact harsh anti-Jewish legislation (the Valladolid Ordinances of 1412). His attitudes no doubt strongly influenced Fernando, who soon became king of Aragón-Catalonia, and whose mercifully brief reign was marred by the harshest anti-Jewish decrees seen in that kingdom. His preaching alone had the desired effect, however, and thousands (possibly hundreds of thousands) of Jews converted all over Spain. Once again, entire Jewish communities, such as that of Segovia, were lost.

In 1413 Pope Benedict XIII, acting apparently with the encouragement of Pablo de Santa María, ordered a disputation at Tortosa to which were “invited” most of the outstanding Jewish scholars of Aragón-Catalonia. The result of this was once again the conversion of many rabbis and Jewish lay delegates, as well as a number of other prominent Jews in the kingdom.

To add to the disastrous state of Spanish Jewry, many of the most important rabbinical scholars had already fled Spain following the events of 1391, going to North Africa. An impoverished and demoralized Jewish population was hardly able to sustain the necessary schools to produce a new generation of scholars, and the effective rabbinical leadership that had always made Spanish Jewry prominent in the world came to an end.

The Inquisition and Expulsion

There is evidence that much of what remained of Spanish Jewry in the second part of the fifteenth cen-

tury became zealous in religious devotion, if lacking in knowledge. The increasing hostility of certain of the nobility and, more particularly, the rising middle-class merchants, toward the conversos created the farce of the Inquisition, with its twin myths of *limpieza de sangre* (“purity of blood” of the so-called old Christians) and the infidelity of the conversos, falsely said to be “bad Christians.” Thus their anti-Semitism was unleashed with official sanction under the guise of rooting out supposed “heresy,” but with the real intent of destroying the conversos, and, once this was accomplished, removing the Jews who gave rise to them. This was behind the Edict of Expulsion, which the Catholic Monarchs were compelled to sign banishing the Jews in 1492. Given only a few months in which to sell their homes and businesses, collect debts, and so on, many Jews not surprisingly chose finally to convert rather than flee their ancestral home of centuries, not knowing what lay ahead or when they would end up. It is perhaps true, and ironic, that the motives of many of these conversos were not religiously pure, and thus that their enemies might to a degree have succeeded in creating the very class that their propaganda pretended to uncover: the lukewarm Christian convert.

The “Crypto-Jew” Myth

From the above account, it can readily be seen how little these conversos were “crypto-Jews,” or secretly loyal to the Jewish tradition, as romantic legend maintained. Most were very sincere converts who became steadfast and even zealous in their Christian faith; all had chosen to convert and were not forced into doing so. This was an important distinction not lost on the rabbis of the age, who unanimously, from the fourteenth through the fifteenth centuries, decided that these converts were not *anusim* (“forced”) but *meshumadim* (“apostates” who freely abandoned their faith and their people). The proof was that they had the opportunity to leave Spain, for Muslim Granada or North Africa, but did not do so.

Conversos entered the service of the Church in unprecedented numbers. Entire monastic orders, like the important one of San Jerónimo, became virtual *converso* enclaves. In addition to the Santa María-Cartagena family, numerous other *conversos* became bishops and archbishops, theologians and canonists.

Finally, the Inquisition itself did not permit even those few conversos who may have wished to maintain some ties with their Jewish past to do so. Watched constantly by spies, and required to educate their children by priests and to attend church constantly, the *conversos* had to be very devout Christians.

Cultural Activity

Converso writers and intellectuals soon gained a position of tremendous importance in late medieval

Spanish society. The majority of the Castilian chroniclers, for example, were *conversos* (Alfonso de Palencia, Diego de Valera, Fernando de Pulgar, and Gonzalo García de Santa María), as were many of the poets and literary figures: Juan Álvarez Gato, Juan Alfonso de Baena, Rodrigo Cota, Diego de Valencia, Diego de Valera, Juan del Encina, and many others. Important religious writers, and authors of anti-Jewish polemics, were Pablo de Santa María, his son Alonso de Cartagena, Pedro de la Caballería, and others.

Converso officials in service of the crown, both in Castile and later in Aragón-Catalonia, rose to levels at least as high as those formerly held by Jews. The Catholic Monarchs were served by at least three converso secretaries (of whom Fernando de Pulgar was the most important), and in Aragón-Catalonia almost all of Fernando's most important officials were conversos, including the famous Santángels and the de la Caballerías who were supporters of Christopher Columbus (who may himself have been a *converso*). Abraham Seneor of Castile, chief rabbi and important tax official, converted along with his family and his son-in-law Meir Melamed, and continued in the service of the queen in the sixteenth century. Fernando de Rojas, author of *Celestina*, and even St. Teresa of Ávila were others who were of *converso* origin, as were Luis de León and many of the great families of Spanish nobility (including the king, Fernando himself).

COPLAS DE LA PANADERA

Through the popular ridicule of a ribald bread seller, dishonor came to Spain's most illustrious houses during the Battle of Olmedo, 19 May 1445. The forces of Alvaro de Luna—favorite of King Juan II of Castile—along with the king and his son, Prince Enrique, were arrayed against the forces of Juan I of Navarre and his brother, Prince Enrique of Aragón. The results were varied: victory went to Castile, Íñigo López de Mendoza was named the marqués of Santillana for his participation, the wounded Aragónese prince was one

of the thirty-seven fatalities of the day, and there was an eyewitness, a *panadera* or bread seller. Her *coplas* in the earlier form of *¡Ay Panadera!* or the later *¡Di Panadera!* accuse the flower of Spanish nobility of cowardice in forty-six octaves with refrain. An introductory stanza, urging the *panadera* to tell all, and a venomous exchange between Juan de Mena and Íñigo de Estúñiga in two appended *coplas* complete the poem.

Few among the forty-two warring grandees escape the bread seller's razor-sharp tongue and scatological good humor: the Bishop of Sigüenza was so terrified that his undergarments needed laundering, Commander Rodrigo Manrique's heart seemed to be made of sugar candy, and Fernando de Rojas trembled like leaves. Pedro de Mendoza ran to hide in the well, the frightened Count of Haro broke wind so loudly that it was heard as far away as Talavera, and Pero Sarmiento who had an encounter with a wine flask, thought he was mortally wounded, and fled, spewing his recent dinner onto the road.

Speaking with the voice of a simple woman, the anonymous courtier-author identifies his peers, not by allusion or allegory, but by name or title and, in so doing, adds the realistic dimension of personalized satire to Spanish letters.

COPLAS DE MINGO REVULGO

The thirty-five *coplas* of the *Coplas de Mingo Revulgo* conceal their meaning behind allegorical allusion in a rustic dialogue between two shepherds, Mingo Revulgo and Gil Arribato.

Mingo, who represents the people, complains that the head shepherd—King Enrique IV of Castile—neglects his flock, caring only for personal pleasure and solitude. The sheepcote, undefended by the four truant sheepdogs—the cardinal virtues—is invaded by the seven deadly sins. Even the clergy, disguised as guard mastiffs, are too corrupt to interfere, permitting the wolves—ministers, nobles, parvenus—to devour the sheep.

Gil, a prophet who represents a higher power, replies with an admonition: the Spanish people are equally to blame for the King's laxness; unless they embrace the three theological virtues, the North Wind—the devil—will bring famine, war, pestilence,

and worse, spiritual death. Only through prayer, confession, contrition, and atonement can man avoid his inevitable doom—nothing less than the end of the world.

While the central theme of the *coplas* is the negligence of Enrique IV, present also is the veiled accusation of his possible homosexuality, as well as contempt for his allowing all three religions to commingle freely. This is political satire in the classical tradition, the idea that virtue may be promoted by exposing vice. The style is erudite and popular, the tone apocalyptic, the pastoral allegory analogous to biblical parable. The form is viewed as the precursor of the dramatic eclogue. Internal evidence suggests both the early date of 1456 and the authorship of Fernán Pérez de Guzmán, although other scholarly attributions have been proposed over the years.

At the heart of the poem lies Catholic doctrine, a religious solution to a political problem: through repentance and penance, the Spanish people may transform their indifferent monarch into a caring and conscientious king.

COPLAS DE YÔSĒF

A lengthy Spanish-Jewish poem concerning the adventures of the biblical Joseph, from his initial dreams and the betrayal by his brothers, his slavery in Egypt, and subsequent empowerment, through to his death. (Compare Gene 37–48.) The *Coplas* consist of *cuaderna-vía*-like quatrains, having the peculiarity that every fourth verse ends with the name *Yôsēf*, regardless of the preceding three verses' consonant rhyme. Three Hebrew-letter manuscripts are known: A Paris fragment (in the Bibliothèque Nationale; now lost) consisting of sixteen quatrains; a Cambridge University fragment of fourty-two quatrains (ed. González Llubera); and an ample Vatican manuscript, recently discovered and edited by Lazar, that runs to 308 quatrains. The Cambridge fragment, reflecting a more archaic language than that of either the Paris or Vatican, can be dated to the first half of the fifteenth century. Since Cambridge represents the narrative's final segments and its quatrains are numbered (261–310), the poem, in an earlier form—supposing one missing leaf at the end—may have consisted of some 312 quatrains. The *Coplas*, like the Provençal *Esther* by Crescas del

Caylar, probably were composed for reading or recitation during the Purim festival. The Vatican manuscript represents a major discovery, allowing us, for the first time, to see this important poem essentially in its entirety. With Shem Tov's *Proverbios morales*, the *Coplas* should rank as one of the most significant works of Hispano-Jewish literature written in Spanish. Together with the Hispano-Muslim *Poema de Yūçuf*, the *Coplas* characterize the *cuaderna vía* meter as a favorite vehicle for medieval Hispanic doctrinal poetry, regardless of the religious affiliation of the authors who used it.

COPLAS DEL PROVINCIAL

Although the complete text of the *Coplas del Provincial* has never been published in Spain, it has maintained its notoriety, figuring in litigations and finding its way into irreproachable genealogies. And in that sincerest form of flattery, a sequel—the *Provincial segundo*—appeared in the sixteenth century.

The satire begins with two introductory *coplas* heralding the arrival of the provincial, the church dignitary who has come to monitor his convent. But the convent turns out to be the court of Enrique IV of Castile. In the 147 *coplas* that follow in octosyllabic quatrains, the provincial calls the whole court to judgment, starting with the king himself. Each grandee is singled out by name or title. The accusations range from adultery, cuckoldry, fornication, homosexuality, incest, illegitimacy, sodomy, and sorcery to the most frequent slur of all, racial impurity. *Coplas* 3 through 97 are addressed to men, 98 through 149 to women. If it were not for the ingenious obscenity of the rhymes, combined with the seriousness of the calumny, the poem would border on monotony: there is no relief from the vulgarity of the language or the coarseness of the invective.

The *Coplas del Provincial* is the work of at least two court poets, its conjectured date 1465, its literary importance twofold. With regard to content, for the first time in Spanish letters the king himself is directly insulted: the provincial has heard that the king continually copulates with the courtier, who is copulating

with the queen. With regard to style, the *Coplas* are the most flagrant example of the religious travesty of the erotic and the profanation of the sacred in all of Spanish literature. As such, they have never been surpassed. Today, even after more than five hundred years, the *Coplas del Provincial* seem no less scurrilous, and no less shocking.

CORBEIL, TREATY OF

In the years after the Battle of Muret (1213) Aragónese-Catalan interests in the south of what is now France proved hard to maintain. French rule was asserted in the county of Toulouse, which was placed in the hands of Louis IX's brother Alfonse of Poitiers, and another brother, Charles of Anjou, acquired Provence by marriage in 1243. Louis IX looked for a diplomatic solution that would confirm French ascendancy in the region without humiliating his rivals; the years 1258–1259 saw him come to terms with both the English rulers of Gascony (at the Treaty of Paris in 1259) and with Jaime I of Aragón, in the Treaty of Corbeil of 11 May 1258. The price was generous recognition that past French claims to suzerainty over Barcelona, Urgell, Besalù, Roussillon, Ampurias, Cerdagne, Conflent, Girona and other border areas must be allowed to lapse; the Aragónese reciprocated by renouncing any claim to interfere in Carcassonne, Rodez, Milhau, Béziers, Agde, Albi, Narbonne, Minerve, Nîmes, Toulouse and the highly autonomous county of Foix, as well as their dependent territories. The full list of places provides a reminder of how extensive Aragónese interference had been in the past. Yet the peace treaty also had strange omissions. The city of Montpellier does not appear, or rather the royal lieutenant appears as the emissary of Jaime I, without any concession being made in respect of Aragónese rights there, and the question of Montpellier would rumble on throughout the late thirteenth and early fourteenth centuries. The rural barony of Montpellier or Aumelas remained under Aragónese suzerainty. The small, remote enclave of Carladès was also left in Aragónese hands, for whatever obscure reason. To seal the alliance Louis and Jaime agreed to a marriage alliance whereby Philippe, heir to France, would take as his bride Isabel of Aragón, Jaime's daughter. This had limited effect because Isabel died in 1271. Jaime took

the opportunity also to renounce any further claims in Provence. It is clear that a faction in Aragón-Catalonia was not prepared to accept the permanent annulment of Aragónese interests in southern France; even Jaime I continued to endow the monastery of Valmagne, beyond Montpellier; and the *Chronicle of San Juan de la Peña* shows that Pedro the Great attempted to resuscitate the Aragónese claim to Carcassonne and other lands in Languedoc in 1280. Yet from a Catalan perspective the treaty had great advantages, drawing a frontier to the north of Perpignan that was only broached by Louis XI and then, finally, by Louis XIV, though the acquisition of Navarre by the French in 1284 posed new threats. The status of Barcelona and the lesser Catalan counties remained for a time imprecise: they were not actually part of the Aragónese kingdom, or indeed any kingdom, though the blanket label "Principality of Catalonia" came into vogue in the fourteenth century as a way of solving this difficulty. Roussillon and Cerdagne were, however, assigned to the new Mallorcan kingdom in Jaime I's will of 1262. The treaty was thus a milestone in the creation of Aragónese-Catalan and French realms that possessed defined boundaries.

CÓRDOBA, CITY OF

The former capital of the Roman province of *Hispania Bætica* went through several periods of success and decline during the Middle Ages. It dominated the middle reaches of the river known later as the Guadalquivir, which were one of the main sources of olive oil for the entire empire, including Rome itself. There seems to have been little change to the political and economic infrastructure of the city under Visigothic rule, but the Muslim invasion of 711 was to have a very different effect. By 717, Córdoba was the capital of Muslim Spain (al-Andalus) under North African control, but between 726 and 929 the city ruled over an independent emirate. In the latter year, Al-Nāṣir li-dīn Allah ('Abd al-Raḥmān III) proclaimed himself "Prince of the Faithful," or caliph, thus severing Mus-

lim Spain, politically and religiously, from the rest of Islam. Under the caliphate, the tensions that had brought about deaths of the “martyrs” of Córdoba between 850 and 859 were largely resolved, in the sense that the population became predominantly Muslim. Between 929 and the final collapse of the caliphate, in 1031, Córdoba reached its full splendor. Not only was the city densely populated and wealthy in this period, but it spawned, under caliphal patronage, a circle of palaces, surrounded by satellite towns, of which the main, partially excavated, survivor is Madīnat al-Zahrā. The glory largely departed from Córdoba in the eleventh century, when al-Andalus divided into *tā’ifa* (party) kingdoms. In the late eleventh and twelfth centuries it once again became a dependency of North Africa, under Almoravid and Almohad rule. Once the Almohads had been defeated at Las Navas de Tolosa in 1212, a Christian conquest was just a matter of time.

The arrival in the city of Castilian troops in 1236 was a surprise as much to the besiegers as to the besieged, but surviving documentation clearly demonstrates that Fernando III’s conquest led to a virtually complete demographic and social transformation in what became known as the “kingdom” of Córdoba. By 1264, nearly all the Muslim population had left the area, and a Spanish feudal system was introduced, complete with aristocracy, knighthood, urban crafts, a peasantry, and a parochial and monastic structure. From then until the end of the Middle Ages, Córdoba was never again a center of government, until Isabel and Fernando made it their base camp for the final Granada war. Nonetheless, the city retained the habit of turning up in the political, economic, and religious controversies that bedevilled Castile in the fourteenth and fifteenth centuries. Its Jews were among those attacked in the pogroms of 1391, and its resulting Jewish Christian (*converso*) community suffered, in 1473, one of the attacks that led the Catholic Monarchs to assert their authority forcefully over the towns of al-Andalus and elsewhere in the kingdom. In the 1480s, the wings of Córdoba’s nobility were temporarily clipped, an inquisition was imposed to purge its converso community, and the city flooded with soldiers, courtiers, and traders from the rest of Spain. Its loyalty to the crown was rewarded by a decline in its manufacturing industry, and a series of natural disasters which outlasted Queen Isabel herself. It retained, however, a reputation for intellectual sharpness that ran from the Romans Seneca and Lucan, through Muslims Averröes and Avicenna and Maimonides the Jew, to the Christian Juan de Mena and the *converso* Antón de Montoro.

CÓRDOBA, EMIRATE AND CALIPHATE OF

The Córdoba emirate and caliphate ruled al-Andalus (the parts of the Iberian Peninsula under Muslim control) from 756 to 1031 and is sometimes known as the Umayyad dynasty or the Marwānid dynasty. Its zenith was reached during the reigns of the caliphs ‘Abd al-Raḥmān III and Al-Ḥakam II (912–976), when political control extended from the Ebro and Duero River valleys south to the Moroccan coastal towns of Ceuta and Melilla; when trade and cultural exchange flourished; and when Córdoba rivaled Constantinople in population, comfort, and beauty.

The emirate period encompasses the years 756 to 929, from the accession of ‘Abd al-Raḥmān I, “the Immigrant,” to the declaration of a caliphate by ‘Abd al-Raḥmān III, “the Victorious One.” *Emir* is an Arabic tribal title for prince or ruler, and as literal descendants of the Umayyad caliphs of Damascus, the Umayyads of Spain were certainly entitled to such a claim.

‘Abd al-Raḥmān I was the apparent sole Umayyad survivor of the ‘Abbasid takeover of Damascus in 750; he fled across North Africa and took refuge with his mother’s Berber relatives in Morocco. Governors appointed by the Umayyad representative in Qayrawān in Tunisia had been ruling al-Andalus since its Muslim conquest in 711, but their power had always been tenuous because of ethnic infighting between Berbers and

General view of the mosque at Córdoba. Copyright © Scala/Art Resource, NY. Mosque, Córdoba, Spain.

Arabs, and among the Arabs themselves. By 756 ‘Abd al-Raḥmān I was able to easily defeat the governor Yūsuf al-Fihri with the help of discontents and Umayyad supporters. He ruled for thirty-two years as emir of al-Andalus, and his direct descendants continued to rule as emirs, and later as caliphs, for almost three centuries.

The caliphate period spans the years 929–1031, from the declaration of a caliphate by Al-Nāṣir to the “abolishment” of the caliphate by the citizens of Córdoba after a quarter century of complete political chaos. For this reason some give the date of the end of the caliphate as 1013, when the Berber Hammudids took the throne. The period immediately following the end of the caliphate is known as the rule of the *tā’ifa* (“party”) kingdoms.

The caliphate as an Islamic institution began in Medina with the death of the prophet Muḥammad in 632. Since Muḥammad was the “seal of the prophets,” no one could claim the same prophetic mantle of authority to lead the Muslim *umma* (“community”). Muḥammad had not left a clearly designated plan of succession, so it was decided by his earliest and most loyal followers, the *sahāba* (“companions”), that Abū Bakr should be named *khaliḥa* (one who follows), or caliph. He led the Muslim community until his death in 634 and was followed by the caliphs ‘Umar (634–644), ‘Uthmān (644–656), and ‘Alī (656–661). All four are known collectively as the *Rāshidūn* (“rightly guided caliphs”). With the murder of ‘Alī in 661, Mu’āwīyya, a member of Muḥammad’s clan, moved the caliphate to Damascus, where he had been governor for twenty years, and established a short-lived dynasty. In 683 a man from another branch of the Umayyad clan, Marwān I, established a longer-lived dynasty in Damascus (thus, the use of the names Umayyad and Marwānīd to later signify the dynasty in al-Andalus). The Marwānids continued ruling the Muslim *umma* as caliphs until the ‘Abbasids rebelled in 750 in northeastern Iran and claimed the caliphate for themselves in Baghdad.

The question remains why ‘Abd al-Raḥmān I did not claim the caliphate himself in the name of the Umayyads when he seized power in Córdoba. The other side of the question is why ‘Abd al-Raḥmān III did claim the caliphate almost two centuries later. The sources indicate that ‘Abd al-Raḥmān I had pretensions of regaining control of the *umma* and reclaiming the caliphate but had enough trouble just trying to consolidate power in al-Andalus. His few efforts to galvanize pro-Umayyad support in North Africa failed. Another explanation might also be related to geography: traditionally, the caliph’s right to rule derived from his role as protector of the holy sites of Mecca and Medina. The ‘Abbasids definitely controlled those cities, as well as

most of the Islamic world from the eighth to the tenth centuries. It is interesting to note that in the *khutba* (sermon) of the Friday congregational prayers, where a benediction on the name of the caliph traditionally was invoked by the imam, the ‘Abbasid caliph was mentioned in Córdoba from 750 to 757. After 757, however, the name of the Umayyad emir was given the blessing, and the name of the ‘Abbasid caliph received a malediction. From almost the beginning of his reign, then, ‘Abd al-Raḥmān I asserted his independence from and disdain of the ‘Abbasid caliphate, although he did not claim the title himself.

There are no concrete or documented explanations for ‘Abd al-Raḥmān III’s later claim to the caliphate either. By the time ‘Abd al-Raḥmān III took over the emirate in al-Andalus in 912, the ‘Abbasids were growing weaker and more corrupt. Some detractors argued that they no longer merited the title of caliphs because they were no longer good Muslims. By the year 929, when ‘Abd al-Raḥmān III declared himself caliph, not only were the ‘Abbasids no longer able to aggressively pursue *jihād* (“holy war”) on the borders of Islam, but they no longer controlled the holy sites in Arabia. Another explanation may lie in the fact that the possibility of more than one caliphal claim had been opened in 909 by the Fāṭimids in Tunisia, who were Ismā‘ili Shiites. Others have argued that 929 was the year when ‘Abd al-Raḥmān III unquestionably gained internal political control, had pursued several successful campaigns against the Christians in the north, and felt confident enough to take a step he had long considered. Whatever his justifications were ‘Abd al-Raḥmān III faced no serious opposition to his caliphal claim in 929, and he easily appropriated the two main symbols of caliphal power—the right to have his name invoked in the Friday prayers (*khutba*) and the right to mint coins (*sikka*) under the title of commander of the faithful (*emīr al-mu’mannīn*).

Córdoba became the capital of al-Andalus in 716 under the rule of the Umayyad governors, but did not become a real center of power and culture until the Umayyad emirate began in 756. At that time it also became a center of civil unrest, and the conflicts within its walls and suburbs often mirrored the ethnic tensions troubling al-Andalus as a whole.

In the last two years of his life, ‘Abd al-Raḥmān I began building a large mosque in Córdoba next door to the fortress on the Guadalquivir. Having a centralized and monumental mosque near the residence of the Umayyad emirs was a way to proclaim and enhance their prestige as well as to underscore the religious legitimacy of their rule. This mosque was completed by his son, Hishām I (788–796), and enlarged and remodeled successively by ‘Abd al-Raḥmān II

(822–852), Muḥammad I (852–886), ‘Abd al-Raḥmān III (912–961), and Al-Ḥakam II (961–976).

As the Umayyad court grew in wealth and power, Córdoba attracted increasing numbers of scholars, artisans, merchants, and opportunists from other parts of al-Andalus as well as the Islamic world. The Christian chronicler Eulogius, of the mid-ninth century, complained bitterly that Latin language and culture were being forgotten as talented young Christian men adopted Arabic language and manners to gain access to and favor in the Umayyad court. This process only accelerated when the caliph ‘Abd al-Raḥmān III built a new palace complex on the outskirts of Córdoba, Madīnat al-Zahrā, named after his favorite concubine. The palace was full of technological wonders and artistic splendors—no expense was spared—but it later came to symbolize the opulence of the Umayyad dynasty, as well as its distance from its subjects.

The political challenges of the emirate and caliphate in Córdoba remained virtually the same throughout their three centuries of power—ethnic infighting was the main internal challenge, and incursions by the Christian kingdoms to the north was the main external challenge. For the most part, until the first quarter of the eleventh century, succession within the Umayyad dynasty was straightforward and peaceful. A large part of the stability of the dynasty is due to a series of relatively lengthy reigns (some of thirty years or more) that gave the emirs and caliphs the opportunity to pursue long-range policies and to effectively train their successors.

From the beginning of the Muslim presence in Spain, internal politics was monopolized by ethnic infighting: after the initial conquest, the tension was between the Arabs and the newly converted Berbers from North Africa, and between the Arabs themselves, whose tribal rivalries went back to pre-Islamic times; as more native Iberians converted to Islam in the ninth century and later, tension between old and new Muslims emerged; as the emirs and caliphs began importing more Berber and *ṣaqāliba* (slave) troops, especially in the tenth century, tensions increased between the native military and political elite and the foreigners who were supplanting them. Some Umayyad rulers were better at managing these tensions than others, but such concerns were always foremost on the political agenda.

When rulers were able to consolidate power internally, like ‘Abd al-Raḥmān II and ‘Abd al-Raḥmān III, they could turn their energies to the Christian frontier to the north. The Muslim conquest had reached as far as Narbonne in the beginning, but by the time ‘Abd al-Raḥmān I took over in 756, a system of military frontiers, or marches (*thugūr*, in Arabic), had been es-

tablished. The Upper March ran along the Ebro valley, was centered in Zaragoza, and was very rarely under direct Umayyad control—the Muwallad (converts to Islam) families of the Banū Qasī and later the Tujībīs were the autonomous rulers of the area, intermarrying with the royal families of Navarre and León and often enlisting their help militarily. The Middle March encompassed the lower Duero River valley, was centered in Toledo, and was often ruled by an Umayyad appointee, though Toledo was the site of several major rebellions. The Lower March was in the southwest of the peninsula, along the Guadiana River, and was centered first in Mérida, later in Badajoz, and ruled by a series of Muwallad dynasties. These marches were the sites of forays by both Muslims and Christians, neither making any lasting territorial gains.

The summer military expeditions (*ṣāʿifas*) of the emirs and caliphs to the marches were as much to discipline and impress unruly Muslim subjects as they were to pursue jihād against the Christians, to “protect” the Muslim community and legitimate the Umayyads’ right to rule. An essential component of their political program was gaining the support of the religious scholars (*faqīhs*) based in Córdoba, who were virtually all from the conservative Malikite school of law. In Islam, religious legitimization of political power, especially if one claimed the caliphate, was necessary. The courting of the favor of the *faqīhs* began with Hishām I, and by the time of ‘Abd al-Raḥmān II, they had become fairly bureaucratized.

External threats to al-Andalus from outside the Iberian Peninsula came from the Vikings, who made a series of attacks in the ninth century, but more crucially from the Fāṭimids of North Africa. The Umayyads had always been interested in establishing a presence in North Africa but were usually too busy with internal concerns. The large number of Berber immigrants in al-Andalus, as well as the establishment of an Andalusī immigrant community in Fez, secured continuous and peaceful trade and communication. The Shiite Fāṭimids came to power in Tunisia in 909, and pursued a vigorous policy of expansion. Luckily for Al-Andalus, this coincided with the reign of ‘Abd al-Raḥmān III, its most capable and powerful ruler yet. By establishing a military presence in the coastal towns of Ceuta, Melilla, and Tangier, ‘Abd al-Raḥmān III was able to prevent the Fāṭimids from making much progress in Morocco. By the 950s they had turned eastward, and in 969 they conquered Egypt. The Umayyads continued to send troops to Morocco as well as to recruit soldiers from the Berber tribes there, but no lasting occupation occurred.

The political policy of the Umayyad emirs and caliphs toward Baghdad and the rest of the eastern

Islamic world was one mitigated by distance. They were too far away from each other to have much direct contact or conflict. Both were well aware of each other due to the continuous and extensive travel and trade throughout the Islamic world, most of it conducted by religious merchant-scholars, and cultural exchange did take place. 'Abd al-Raḥmān II imported a poet-musician from the 'Abbasid court, Ziryāb, who is said to have revolutionized the Umayyad court and Córdoba society. Increasingly the Umayyads imitated 'Abbasid political and cultural forms. But al-Andalus also gained prestige among Eastern Muslims as an oasis of Muslim culture and Malikite orthodoxy and an active frontier of the jihād, and attracted many visitors for both reasons. Embassies were regularly sent to the courts of Constantinople and European capitals, usually headed by Andalusī Christians or Jews.

It is difficult to determine the date of the end of the caliphate but not difficult to trace the causes of its relatively quick decline. The caliph Al-Ḥakam II died in 976, leaving a large and powerful al-Andalus in the hands of his fifteen-year old son, Hishām II, who had virtually no political experience or training. There were several men in influential political and military positions, representing the various ethnic interests, who jockeyed for power under the weak caliph. Al-Manṣūr, the famous religious scholar turned politician and military leader, who had established power in the harem and as *qāḍī* (religious judge) of North Africa, won out. He methodically destroyed his rivals and established complete *de facto* political and military control while still claiming to be the supporter and defender of the Umayyad dynasty. (It is a situation parallel to that of the Buyids in Baghdad who kept the 'Abbasid caliphs as puppet rulers for almost two centuries.) Al-Manṣūr was considered by many to be as effective a ruler as 'Abd al-Raḥmān III, and even more so because of his piety, severity, and success militarily against the Christians.

But Al-Manṣūr was riding the cresting tide of divisive policies that had begun centuries before. The accelerated importation of slave soldiers (*ṣaqāliba*) from Eastern Europe (but also from the Christian parts of Spain) by 'Abd al-Raḥmān III had led to their gaining great power in the political and military machinery of al-Andalus. Al-Ḥakam II had tried to counterbalance this presence by importing large numbers of Berber soldiers, who often came as intact tribes. Both groups antagonized the Andalusī and Umayyad elite, who were displaced. When Al-Manṣūr died in 1002, his sons, Al-Muẓaffar and Sanchuelo, successively came to power behind the figurehead of Hishām II. They did nothing but exacerbate the rivalries in the capital, and by 1009, all the ethnic groups were staging coups from

provincial power bases and forwarding their own Umayyad pretenders to the throne. In 1013 Hishām II was murdered and the Hammudid Berber dynasty took over the caliphate. Power changed hands repeatedly until 1031, when the elites of Córdoba supposedly abolished the caliphate, making way for a splintering of power among the provinces.

CÓRDOBA, MARTÍN DE

Fray Martín de Córdoba (d. 1476), an Augustinian friar trained at Toulouse held, among other posts, that of vicar general of the Augustinian convent at Salamanca, and conventual of the convent at Toulouse. Deeply involved in the conflict between those who thought the principal function of a convent was to be a spiritual retreat (*observantes*) and those who advocated an active role in study and teaching, he taught moral theology at the University of Salamanca. The *Jardín de nobles donzellas*—a praise of women and an advice to the then Princess Isabel (1468) just before she was to ascend to the Castilian throne—enjoyed two early printings. (Valladolid, 1500, and Medina del Campo, 1542). His other works circulated in manuscript, though three were edited in the twentieth century: the *Compendio de la fortuna* (1453) a work that deals with the mutability of fortune dedicated to Alvaro de Luna shortly before his beheading, and the *Tratado de la predestinación* (c. 1470–1476), printed unedited in 1917 by Fulgencio Riesco Bravo and subsequently edited by Sánchez Fraile and reprinted in 1956; and a brief essay on preaching, "Ars praedicandi."

Among works attributed to Fray Martín that have not yet come to light are *Exameron*, a treatment of the six days of Creation; *Comentarios sobre el Apocalipsis de San Juan*; another on the Epistles of Saint Paul, *Comentarios sobre las epístolas de San Pablo*; an advice to nuns, *Alabanza de la virginidad para religio-*

sas; a treatise on logic and philosophy, *Lógica et Philosophia*; an unspecified theological treatise, *De mistica et vera theologia*; and *Libro de diversas historias*, possibly a collection of *exempla*.

CÓRDOBA, MARTYRS OF

The forty-eight Christians who were executed in Córdoba for religious offenses against Islam between 850 and 859 were known as the Martyrs of Córdoba. What we know about them comes almost exclusively from the martyrologies and apologetic treatises composed by Eulogius of Córdoba—who was himself executed in 859—and his friend Paulus Alvarus. Though the execution of the priest Perfectus in April 850 is the earliest recorded in the martyrology, the real beginning of the "movement" per se was the execution of Isaac on 3 June 851. Isaac had worked as a secretary in the Córdoba government prior to retiring to a monastery outside of Córdoba. Three years later, he returned to the city and spontaneously denounced Islam in the presence of a Muslim *qādī* (judge), and was decapitated as a blasphemer. Isaac's action inspired a number of other Christians, mostly from local monasteries, to follow his example, resulting in seven more executions over the next four days and three more by the end of July 851. By the end of the summer of 853, thirty-six Christians had been put to death, either for blasphemy or apostasy. Most of them actively sought their deaths, though some were, as Perfectus had been, victims of circumstances beyond their control. The executions became more and more sporadic as the decade wore on. The death of Eulogius himself in March 859 marks the traditional end of the "movement," though Arabic sources—which are silent about Eulogius's martyrs—indicate that there were occasional executions of Christians for religious offenses over the course of the next century. Though the incidence of executions between mid-851 and the end of 853 was no doubt unusually high, it was equally unusual that the victims should have someone like Eulogius to record their deeds. As a result, it is difficult to determine, outside of this two-year period, whether the victims were in

fact linked to each other by more than their inclusion in Eulogius's martyrology.

The unusual concentration of Christian dissent in Córdoba in the early 850s was the cause of enough concern among the local Muslim authorities to prompt a variety of measures on their part to discourage would-be martyrs. In the summer of 851, the emir 'Abd al-Raḥmān II (822–1852) ordered the arrest of the Córdoba clergy and detained them for some months, hoping to impress upon them his impatience with the situation. His successor Muḥammad I (852–886) convened a council of Christian bishops to deal with the matter in the summer of 852.

The executions, and in particular the apparent willingness with which many of the victims embraced the sentence for blasphemy and apostasy, led to a deep rift within the Christian community of Córdoba. Some, like Eulogius and Alvarus, applauded the actions of these Christians, calling them martyrs and composing *passiones* that recorded the details of their martyrdoms. It is clear from the apologetic nature of these sources, however, that Eulogius and Alvarus were writing, at least in part, to convince a community of Christians that had by no means unanimously accepted Isaac and his like as legitimate martyrs. The arguments that Eulogius and Alvarus posed on behalf of the would-be martyrs reveal that many Christians did not regard the situation in Córdoba as persecutory and therefore had difficulty seeing their executed coreligionists as anything other than suicides. Others show that these same Christians saw the Muslims not as pagans bent on oppressing the church or as devotees of a false prophet but as fellow worshippers of God, with whom it was permissible for themselves as Christians to interact. These opposing views of Islam and the Muslims are perhaps best understood as a reflection of differences in levels of assimilation to Muslim society among the Christians in the area. Many, though certainly not all, of the executed Christians came from outlying monasteries and rural areas around Córdoba where their contact with Muslims was limited. Presumably the Christians who lived in Córdoba were more likely to come up with a workable *modus vivendi* with the Muslims that would allow all to participate in the local society and economy.

CORNAGO, JOHANNES

Spanish composer, most noted from 1449 to 1475. Already a Franciscan friar, he received a bachelor of biblical studies degree from the University of Paris in 1449. No later than 1453 he was a member of Alfonso V el Magnánimo's court at Naples, where on 6 April his yearly salary was fixed at the equivalent of three hundred ducats. A papal bull drafted 29 June 1453 but not signed until 20 April 1455 by Pope Calixtus III, identified him as Alfonso V's chaplain—who despite his Franciscan vow of poverty was permitted to acquire any benefice secular or regular and to hold a canonry or other dignity in a cathedral or collegiate church. After Alfonso's death on 27 June 1458, Cornago became Don Ferrante's chief *almoner* (dispenser of royal charity). On 3 April 1466 he received ten ducats and a tari to pay for the cost of altering certain garments in the royal wardrobe that Ferrante proposed giving away on Maundy Thursday to thirty-four poor persons. On the same day he took in trust twenty-five ducats to bestow as alms during the king's adoration of the true cross the following Good Friday. According to Higinio Anglés, Cornago, upon returning to Spain, became in 1475 a singer in Fernando V's court chapel.

Cornago was the first Spanish composer to write a complete extant polyphonic mass. Titled *Frater J. Cornago Missa Signum de lo mapa mundi Apud Neapolim est la missa de nostra donna Sancta Maria* (Trent Codex 88, fol. 276v), this mass includes a tune sung by the tenor, with the *Ayo visto lo mapa mundi / et la carta di naviga / re ma chichilie mi Pare la piu bella di questo mondo* [I have seen the map of the earth / and the mariner's chart, / but Sicily seems to me the most beautiful part of the world]. This popular song, inspired by Jan van Eyck's map painted about 1430 (and highly praised in 1456 by Bartolomeo Facio, resident at Alfonso's Neapolitan court 1444/5–December 1457), recurs with the tenor throughout the mass. Composed before 1460, Cornago's mass ranks with Guillaume Dufay's *Missa Se la face av pale* as one of the earliest masses based on a secular tune. Cornago's other Latin work, the four-voice fragment *Patres nostri peccaverunt* (Montecassino MS 871A, page 248), sets to music Lamentations 5:7.

Cornago's eleven surviving courtly songs, always for three voices, all express disappointment in love: the *Colombina cancionero* (1971) contains *Donde' stas que non te veo, Gentil dama non se gana, Porque mas sin duda creas, Qu'es mi vida Preguntays* (with a fourth voice added by Ockeghem), and *Señor qual soy venida* (= *Infante nos es nascido*). The *Cancionero de Palacio* (1947) also contains *Gentil dama non se gana* and *Señor qual soy venida*, and the Montecassino

manuscript 871A adds *Moro perche non dai fede, Morte merce* (an Italian syllabic text in all voices), *Non gusto del male*, and *Sequen las penas me days*.

CORRAL, PEDRO DEL

Little is known about the life of the man who wrote the *Crónica sarracina* (or *Crónica del rey Rodrigo*) in the first half of the fifteenth century. Presumably he was the brother of Rodrigo de Viilandrando, Count of Ribadeo, with whom he participated in Juan II of Castile and León's campaign against Alfonso V of Aragón. It is possible that the brothers were involved in the incarceration of the bishop of Palencia and other Castilian noblemen, including Fernán Pérez de Guzmán, one of the most important historiographers of the Spanish Middle Ages and Corral's most severe critic. In the prologue to his *Generaciones y semblanzas*, which has been widely accepted as the first Castilian treatise on the rules of historical discourse and the duties of the historian, Pérez de Guzmán calls him "un liuiano e presuntooso onbre" (a light headed and presumptuous man) and his *Crónica* a "trufa o mentira paladina" (fraud or public lie). These words, written while Pérez de Guzmán was in jail, seem to have determined the fate of the *Crónica sarracina*, unfairly ignored, when not condemned, by historiographers who have looked mainly at its anachronisms, and later redeemed by literary critics who, focusing on the chivalric and courtly atmosphere that surrounds the events leading to the Moorish invasion of Spain, consider it an early historical novel.

Whether Corral's intention was to write a chronicle or a fictional text, the *Crónica sarracina* could be, and has been, read as both, because it incorporates medieval conventions of verisimilitude that were used in fictional as well as historical texts. Among these conventions are the fictitious authors, Eleastras and Alanzuri, who are introduced at the beginning of the story as the chroniclers commissioned by Rodrigo to write the history of his kingdom, and the forgery of letters and documents that are transcribed and quoted throughout the text. These fictitious authors and sources unveil the story of Rodrigo's haughtiness in Hercules' tower; his adulterous love affair with La

Cava; the treason plotted by her father, Count Julian, with the Moorish leaders Muḡa and Tarif; and the total defeat of the Christian army Eleastras's chronicle ends with his death in battle. An anonymous parchment containing the story of Rodrigo's repentance and penitence is found centuries later by a soldier called Carestes in the king's tomb and is incorporated into Eleastras's manuscript, which, according to the author, was found in a market.

Although these conventions could be considered fictional and were adopted by later authors like Miguel de Cervantes, textual and authorial forgery, rooted in the Christian apocryphal tradition, was largely used in the Middle Ages as a strategy to legitimize discourses that claimed historical truth, such as the *Privilegio de los votos de San Millán* attributed to Fernán González, in which the grateful hero imposes an annual tribute for the monastery of San Millán de la Cogolla, and many hagiographical texts. In a period when authority was based on antiquity, fame, and personal witness of events, it is not surprising to find that, in spite of Pérez de Guzmán's bitter judgment, the *Crónica sarracina* was followed by many historians, such as Diego Rodríguez de Almela, who quotes Eleastras as an *auctoritas* (authority) in his *Compendio histórico*, and was widely diffused during the fifteenth and sixteenth centuries, as proved by its many extant manuscripts and editions.

CORREGIDOR

The *corregidor* was a Castilian official appointed by the crown to direct the government of a city (or several neighboring cities), assuring that both the general laws of the kingdom and the local laws (*fueros*, *ordenanzas*) were obeyed, thereby also maintaining the supremacy of monarchical power over the municipal body. Alfonso XI increased royal control over local politics between 1326 and 1345 by substituting the general assembly of citizens (*consejo abierto*) with the smaller *cabildo de regidores*, consisting of twenty-four people named by the king from among the members of the *consejo abierto*. In addition, starting in 1348 he began to send corregidores with judicial and inspectorial functions to some cities. At the end of the fourteenth century, Enrique III renewed these appointments in order to fight disorder and abuse at the local level. Between 1406 and 1474 the monarchy appointed more corregidores, often against the wishes of local leaders,

who protested the fact that this was always done previous to the city's request. The Catholic Monarchs (1474–1516) expanded the continual presence of the corregidores and regulated their functions (the *Capítulos* of 1480, 1493, and 1500): there were roughly eighty *corregimientos* throughout Castile. The corregidor depended on the *Consejo Real*, which appointed him and managed the coordination of the kingdom's governing bodies, but the city paid his salary. The term of appointment was one year, although occasionally this was extended. At the end of the term, the corregidor could be brought to trial (*juicio de residencia*) to determine if he had performed correctly his duties, which included exacting justice (he was the royal judge par excellence), presiding over the *cabildo de regidores*, and directing all municipal activity: local law reform, police activity, military citizen organizations, public works and services, control of the local finances, and the application of the kingdom's economic and ecclesiastic policy. The corregidor was, in short, the crown's "omnicompetent servant" in the city.

CORTES, CROWN OF ARAGÓN

Parliamentary institutions in the Crown of Aragón developed, as elsewhere, from festive and consultative courts occasionally convoked by the greater counts and kings in Catalonia and Aragón. It is not clear whether there was anything specifically "feudal" about this experience. The early *cortes* (*corts* in Catalan) were obligations laid upon knights in the Pyrenees for attendance on great lords rather than for counsel. Moreover, as elsewhere, the conceptual association of counsel and aid was an ecclesiastical as well as a military legacy. Great courts throughout Christian Spain were solemn celebrations of lord-kingship, more nearly public than feudal in character; they were occasions on which protector-rulers often threatened by the Muslims habitually dominated proceedings in which the mode of action was passive and deferential, responsive to the lord-king but not political.

This situation prevailed until the thirteenth century. The great assemblies of Aragón and Catalonia, often termed *curia*, met to ratify statutes of territorial security and dynastic decisions; they sometimes coincided with ecclesiastical councils. As early as 1162 a plenary assembly at Huesca prefigured the future *cortes* of the Crown of Aragón. But that tradition never

overcame the practice of convoking the magnates of one realm, as at Zaragoza (1164) for Aragón and at Fondarella (1173) for Catalonia. The latter assemblies, held in the early years of Alfonso II (r. 1162–1196), were both concerned with peace—that is, with sanctions against violators of what was then known as the “Peace and Truce” (*pax et treuga*). These were, so far as we can tell, characteristically celebratory occasions on which the lord-king’s role as institutor of the peace was deferentially accepted.

However, the peace program in both lands, especially in Catalonia, was opposed by the barons, who saw it as threatening their habitually violent domination of peasants at a time when the lucrative Muslim wars had been interrupted. By the 1180s the program seems to have lapsed in both lands. Alfonso tried to reinstate it in great courts held at Huesca and Girona (1188), and whatever may have happened in Aragón, the reaction in Catalonia was explosive. At Girona the count-king was obliged to offer concessions to magnates who, in the end, refused to ratify the statutes. Then, in an assembly held at Barcelona (we do not know just when), the barons categorically rejected the whole peace program; that is, the king’s prerogative to keep the peace. And in a series of assemblies from 1192 to 1205, Alfonso II and Pedro II (r. 1196–1213) struggled in vain to recover their lost initiative in consultation.

The Catalanian *corts* held from 1188 to 1205 mark the origins of parliamentary life in the Crown of Aragón. Here, for the first time, the barons can be seen to act politically—that is, to contest the ruler’s prerogative in the ceremonial court or even to disrupt proceedings; here are the beginnings of debate between members of interested estates as distinct from passive deference to the lord-king. This politicized confrontation was the critical change, and it soon entailed another: the summons of towns and villages to be represented by their notables. Precedents for such enlarged summonses go back to the 1150s in the Pyrenees, but it was in the first quarter of the thirteenth century that they became common (if not yet quite customary) in Aragón and Catalonia. The people of both realms, including townsmen, were convoked at Lérida (in the borderland) to deal with the dynastic crisis in 1214. Great plenary assemblies met at Barcelona to prepare for the invasion of Mallorca in 1228 and at Monzón to prepare for that of Valencia in 1236.

By that time every significant attribute of the mature medieval *cortes* was in place. During the reign of Jaime I (1214–1276), the occasional summons of magnates was transformed into institutions of the estates, including that of the towns. And their experience in insisting on privilege was a cause of Jaime’s reluc-

tance in his later years to summon the *cort(e)s*. Moreover, an institutionalized procedure had already developed: the hortatory proposition by the king (or by a prelate speaking for him); responses by ad hoc delegates of clergy, barons, and towns, followed by discussion within the orders; and the public agreements and decisions: vote of taxes, setting of date of muster, promulgation of statutes. In 1264 at Zaragoza there was a demand for redress of grievances prior to deliberation on the king’s request.

In 1283 King Pedro III’s prolonged failure to confirm the privileges of Aragón and Catalonia, combined with his costly conquest of Sicily, resulted in tumultuous assemblies at Zaragoza and Barcelona. It is customary to date the *cortes* as a parliamentary institution in the Crown of Aragón from these meetings. This view is mistaken, for reasons that should be clear. With one exception, every element of these occasions, and indeed the combination of these elements, was traditional. Politicized confrontation over privilege, summons, representation of men from the several orders, procedure—none of this was new; and as for the demand in both assemblies that the *cortes* should henceforth be summoned periodically, this was so poorly observed thereafter that it must be disqualified as a test. It is true that Jaime II (r. 1291–1327) summoned *cortes* in his early years; by working through them before the estates were tempted to act on their own, this canny ruler defused political opposition.

In fact, as elsewhere, the *cortes* of the later medieval Crown of Aragón had a fitful history influenced by fiscal and political necessity. During his Castilian wars Pedro IV (r. 1336–1387) became so dependent on taxes voted by his *cortes* as to lose the initiative in policy and finance. The *diputació* of the Catalanian *corts* functioned from 1359 as a permanently standing commission of the assembly. Similar institutions developed in other realms (including Valencia); everywhere the *cortes* expressed the privileged aspirations of the powerful, being (in that sense) politically regressive. In Catalonia the exclusion of the lesser knights consolidated a formidable alliance of landed magnates and urban oligarchs through which a “pactist” program hostile to fiscal and agrarian reform was confirmed. The *cortes* of Aragón, constituted in four estates (that of the nobility being divided), supported Alfonso V (r. 1416–1458) in his Mediterranean ambitions better than the earlier *cortes*, but their interminable proceedings revealed the hollowness of their claim to represent power fairly.

CORTES, LEÓN, CASTILE, AND PORTUGAL

By the mid-thirteenth century the *corte* (plural, *cortes*), an example of the European parliamentary tradition, emerged in Castile, León, and Portugal. This reflected the growing importance of towns that controlled extensive territories and supplied substantial militia forces for the reconquest. The *corte* was a natural expansion of the royal council as kings summoned townsmen to assemble with bishops and magnates. The three estates gathered with the king constituted the fullness of the kingdom acting as one legal person. The king's need to ask consent before imposing new taxes or to alter the laws was the principal reason for summoning the *cortes*. The assembly gave the participants an opportunity to present their grievances to the king and to urge governmental reform.

Alfonso IX of León first summoned urban representatives to his council at León in 1188. The Castilian kings likely did so from the second quarter of the century. After the union of Castile and León in 1230, the *cortes* were convened jointly, though occasionally separate meetings were held in order to thwart opposition to royal policy. From the mid-fourteenth century the *cortes* were a joint assembly for both realms. Afonso III of Portugal convened the first *corte* at Leiria in 1254.

The *corte* consisted of three estates (later called *brazos*): prelates, nobles, and townsmen. Archbishops and bishops (about twenty) customarily attended, but abbots, priors, masters of military orders, and proctors of cathedral chapters were sometimes summoned. About twenty magnates (*ricos hombres*) and as many knights (*caballeros*) also participated. Prelates and nobles attended the Castilian *cortes* irregularly in the fifteenth century and not at all after 1538.

All towns directly subject to the crown were summoned, but not all of those summoned always sent representatives. Perhaps the largest assembly were the *corte* of Burgos in 1315, when 100 towns sent 201

representatives. The number of Castilian towns represented steadily decreased to a mere seventeen in 1480. Many towns were no longer summoned because they were held in lordship by bishops and magnates. Attendance was viewed as a burden. Whole regions had no representation at all, and representatives in attendance acted solely on behalf of the urban oligarchy.

Representatives, first described as *omnes bonos*, *los de la tierra*, or *personeros*, were by the early fourteenth century identified as procurators. This Roman legal term designated one empowered to represent an individual or a corporation in court. Urban procurators received letters giving them full power (*plena potestas*) to act in the name of the town and to bind it in advance by their actions. Royal insistence that representatives have full powers was intended to prevent a town from later repudiating its procurator. Representatives were probably elected in the same manner as other municipal officials. From the late fourteenth century they were designated by the town council, chosen by lot, or municipal officials who served in rotation. Despite protests by the *cortes*, in the fifteenth century Juan II and Enrique IV named procurators to represent Castilian towns. The Castilian *cortes* of 1430 prohibited persons of humble condition from serving as representatives. The number of representatives was usually two, who were remunerated by the towns, though in the fifteenth century they were paid by the crown. They were assured of royal protection when traveling to and from the *cortes*, and during the sessions.

Only the king or his regents could summon the *cortes*. His presence was essential to the legality of the assembly. Letters of summons indicated the purpose, place, and day of the meeting. The Castilian *cortes* met frequently in the late thirteenth and early fourteenth centuries, sometimes as often as every three or four years. Alfonso XI, however, convened the *cortes* at irregular intervals, and then usually in regional rather than plenary sessions. The Portuguese *cortes* of 1385 asked João I to hold annual parliaments, but these were found to be too burdensome. The Portuguese *cortes* met twenty-eight times between 1385 and 1491. Meetings, usually lasting a few weeks, were held in palaces or cathedral or monastic cloisters in centrally located towns such as Burgos, Valladolid, Madrid, Lisbon, Coimbra, and Santarém.

The king opened the assembly by declaring the reasons for convocation and perhaps requested a subsidy. Each estate then responded (in Castile and León, the archbishop of Toledo, the lord of Lara, and the representative of Burgos). Toledo persistently challenged Burgos's claims to speak for the Castilian towns, but in 1348 Alfonso XI declared that Burgos should speak for Toledo. Little is known of the deliber-

ations of the estates as they met separately to consider the king's requests and to draw up petitions. Once the petitions were approved by the royal council and a subsidy was voted, the *corte* were dissolved. Texts (*cuadernos*) containing petitions and royal responses were given to the procurators as a record of the principal actions taken.

Few rules defined the competence of the *cortes*, but it could intervene in matters relating to the succession, the recognition of a new king or the heir to the throne or the regulation of a minority; legislation; taxation; and other aspects of foreign and domestic policy. The Portuguese estates assembled in 1385 elected João I as king, and in 1438 the *cortes* of Torres Novas declared that only the three estates could determine the regency for a minor heir. The Castilian *cortes* confirmed the authority of regents during several minorities and also recognized the rights of royal heirs.

The *cortes* participated in legislation chiefly by submitting petitions concerning most areas of government. Petitions were usually presented by the townsmen, but occasionally by nobles and prelates. The towns constantly demanded that the king guard their charters and privileges, guarantee justice to all, punish corrupt officials, curb the lending activities of Jews, control prices or wages, and restrict the alienation of the royal domain. Prelates petitioned the king to uphold ecclesiastical jurisdiction and immunities, and the nobles usually asked for confirmation of their traditional usages. Once the royal response was given, ordinances enacted these decisions into law. The king, with the counsel and consent of the *cortes*, also promulgated ordinances regulating the administration of justice, the chancery, military obligations, and the like.

More systematic legislation prepared by royal legists was also enacted in the *cortes*, such as the Ordinance of Alcalá, promulgated by Alfonso XI in the *cortes* of 1348. In 1305 and 1313 the principle was asserted that laws promulgated in the *cortes* could be repealed only by the *cortes*, but this was never strictly observed. Since the crown tended to issue charters contradicting enactments of the *cortes*, the *cortes* of 1379 protested, and in 1387 Juan I pledged that such charters were not legally binding. Nevertheless, in 1427 Juan II declared that his charter was to be obeyed as law "just as if it had been enacted in *cortes*." While acknowledging the legality of ordinances enacted in the *cortes*, he clearly believed that he could legislate without those bodies. The Portuguese *cortes* also protested against the derogation of ordinances enacted in them, but Afonso V declared in 1451 that he would alter the laws made in the *cortes* "whenever the case required it."

The most important function of the *cortes* and the principal reason for the frequency of their meetings was to consent to taxation. Requiring extraordinary funds to meet his increasing financial needs, the king had to ask his people for subsidies; he could not levy taxes arbitrarily. Since the clergy and nobility were exempt, his request was usually made to the townsmen. Prelates and magnates were sometimes asked to consent to the imposition of taxes on their dependents. Extraordinary taxes or *servicios* were often expressed in terms of *moneda forera*, a tribute paid in return for the king's pledge not to alter the coinage for seven years. Alfonso IX levied such a tribute in 1202, and Afonso III did so in the *cortes* of Leiria in 1254. The obligation to seek the consent of the *cortes* before levying taxes was affirmed in the Castilian *cortes* of 1307, 1315, 1329, and 1391. Taxes were usually imposed for a fixed term of a year or two, but there were exceptions. A specific purpose was often stated, as in 1407, when the Castilian *corte* asked that the subsidy would be expended only on the war against the Moors. Although the *cortes* often haggled over the amount requested, some kind of grant was always forthcoming. In 1308, 1315, 1317, 1386, and 1387 the Castilian *cortes* asked for an accounting of the king's revenues before giving consent. The *cortes* often demanded that taxes should be collected only by incorruptible citizens of towns and not by Jews, Muslims, nobles, churchmen, or high officials. The *cortes* of Segovia in 1386 appointed officials to receive and expend the subsidy voted to the crown, but this effort to control royal finance never developed further. Neither Juan II nor Enrique IV hesitated to collect taxes without consent or to spend money for purposes other than those stipulated by the *cortes*.

From the early thirteenth century until the middle of the fourteenth, the *cortes* passed through a time of vigorous growth and development. In times of crisis they could have a determining influence on public affairs and could effectively limit the power of the crown. At the same time it could be manipulated by the king to his own advantage. In the fifteenth century the *cortes* declined in importance, although Fernando and Isabel at first used them to bolster their reforms; from 1482 to 1498, however, they did not summon the *cortes* because they were not dependent on their subsidies. Thereafter they convoked *cortes* to obtain money for the conquest of Granada and the Italian wars. All told, they summoned *cortes* only nine times. João II of Portugal also used the *cortes* to undercut noble opposition, but he convened them only four times between 1481 and 1495; Manuel I summoned them four times between 1495 and 1521, and did not hesitate to levy taxes without consent. Thus, at the

close of the Middle Ages, by infrequent convocation and careful manipulation, the *cortes* were subordinated to royal power.

COTA RODRIGO

Cota (also known as Ruy Sanches Cota, or de Toledo, “el Viejo” or “el Tío”) was born between 1430 and 1440, to a family of *conversos* (Jewish converts to Christianity). The house of his father, the merchant Alfonso Cota, was burned in 1449 in the anti-*converso* riots that led to the formulation of the Toledan “purity of blood” statutes. The family background was one of comfortable merchants and financiers with landed estates who were involved in Toledo’s municipal government and the kingdom’s civil service. They were closely related to other *converso* families (e.g., Arias Dávila and Ciudad Real) by financial, marriage, and geographical ties. His marriages to Isabel de Sandoval (d. 1477) and to Isabel de Peralta, from noble Christian families, followed the pattern of other converso families. He died soon after August 1505 at Torrijos and was buried in Toledo at the family chapel in the parish of San Nicolás.

Cota’s *Diálogo entre el Amor y un viejo*, first published anonymously in the *Cancionero general* of Hernando del Castillo (1511), probably was written between 1470 and 1480. The 630-line *Diálogo* is composed of seventy mixed *coplas* (stanzas). The strophes consist of a four-line *redondilla* followed by a five-line *quintilla*. It is written in octosyllabic verse that rhymes *cdccd*. Its dialogue form was common in medieval Castilian literature, and its theme has antecedents in the invective against *Frauendienst* and in the *cancionero* poetry (e.g., Pedro de Cartagena, Jorge Manrique, Juan Rodríguez del Padrón) in which male lovers confront the god of love. Similarly the setting—the garden or the house of love—is typical of the *cancioneros*. Yet clearly the work has an idiosyncratic character. Castro has explained it in vitalist terms and has spoken of a “*vivir amargo*,” while Aragón in

the introduction to her edition has seen its particularity in the “biblical violence” of its heightened pessimism and in the “biblical dramatism” of the “Hispanic Semite.”

Cota’s other well-known work, the *Epitalmio burlesco*, is composed of forty-nine *redondillas* and nine *quintillas*, 241 lines in all. Its satire is directed against the “Judaizing” customs of a *converso* who marries a Christian (possibly, according to Cantera, Diegarias’s marriage in the first half of the 1470s to Marina de Mendoza, bastard daughter of Diego Hurtado de Mendoza). The main problems of the text—the difficulty of the “vocablos semíticos” of a “texto oscuroísimo,” according to Cantera, and the allusions to what Menéndez y Pelayo termed “usos poco sabidos de la población israelita de España”—have not been solved by its many modern editions. It has been suggested that the “Jewish” element should be a main concern of *Epitalmio* research because it is the one addressed by its contemporary audience (e.g., the well-known comment of an early reader, Queen Isabel: “que bien parescia ladrón de casa” (he seemed like a house burglar). This has been attempted by trying to reconstruct the dynamics of ethnic humor within contexts of ethnic tensions, as well as by paying attention to the characteristics of representation of the ethnic “other.” The main satire is directed against “Jewish” language (the lexical as well as the syntactic and morphologic components), names, and diet (i.e., against the prime themes of ethnological definition), and corresponds to the obsessions of Cota’s audience and contemporaries, as revealed in Inquisition files that contain testimony from witnesses who lived in Segovia, Toledo, and Madrid at the time of the composition of the *Epitalmio*.

Francisco del Canto, the editor of the 1569 edition of the *Diálogo*, attributed to Cota the authorship of the *Egloga que dicen de Mingo Revulgo* and the first *auto* of *Celestina*. Though the first attribution seems to have been discarded, the second is still held by some scholars. In a poem Antón de Montoro attacks Cota for his anti-*converso* satire with the significant allusion to Cota’s Jewish lineage in the line “vuestro agüelo, don Barú” (your grandfather, don Baru[ch]). Cota is also the author of an *esparza* in which he discovers the properties of love, and, of the “*Respuesta*” to Gómez Manrique’s poetic question “sy ovo reyes primero/qué caualleros oviesse?” [If Kings were first, what knights would there be?]

COURTLY LOVE

Courtly love (*amour courtois*), a term popularized in 1883 by Gaston Paris, is widely accepted by literary critics and cultural historians as a convenient description of a conception of love that informed a tradition of European literature from the twelfth century until the Renaissance. The Provençal troubadours used other expressions, such as *fin'amors*, *bon'amors*, and *vrai'amors*; similar terms (e.g., in Castilian *fin amor* and *buen amor*) are found in other Romance languages. Although the adjective *courtly* was rarely employed by medieval writers in this context, it is appropriate because it indicates the ethic of courtliness and draws attention to the aristocratic milieu in which this literary or poetic convention flourished. It thus establishes a link between Provençal poetry of the early twelfth century, northern French romances of the late twelfth century, German minnesinger poems, and romances of the thirteenth century, Galician-Portuguese lyrics of the same period, Italian literature of the early fourteenth century, English literature of the late fourteenth century, and Catalan and Castilian literature of the fifteenth century.

Whether it is treated seriously or satirically, this tradition is evident in the works of most major medieval authors, including Bernart de Ventadorn, Guillaume de Lorris, Chrétien de Troyes, Chaucer, John Gower, Dante, Petrarch, Marie de France, Charles d'Orléans, Gottfried von Strassburg, Thomas Malory, the Marqués de Santillana, Diego de San Pedro, and Fernando de Rojas. It is also of central importance in the works of Renaissance writers such as Gil Vicente and Garcilaso de la Vega. Although they have never been considered of major importance, partly because so little of their work has survived, twenty known women troubadours, at least a third of whom were patrons, were writing in Occitania in the late twelfth and early thirteenth centuries; their poetry, which is more varied and personal in tone than that of their male counterparts, sheds fresh light on the courtly love phenomenon.

The essential features of this conception of love are the beloved's superiority, love worship, voluntary commitment, secrecy, the interdependence of love and poetry, and the ennobling, yet potentially destructive,

power of love. The beloved was invested with the sovereignty of a feudal overlord or the perfection of a goddess. The lover humbly pledged to serve her, demanding no more than a sign of recognition for deeds performed on her behalf. Since a public display of emotion might jeopardize the lady's honor, particularly if she was married, discretion was a fundamental precept and a condition of any sexual favor that she might confer. This explains why it was customary for the poet to conceal his beloved's identity and to express himself in a deliberately ambiguous manner. By endeavoring to make himself worthy of his beloved, the lover acquired a number of moral, courtly, and military virtues. If she was too easily accessible, love would cease to be arduous and ennobling; yet if she epitomized the archetypal *belle dame sans merci*, the traditional symptoms of love—emaciation, trembling, insomnia, fainting, and pallor—could deteriorate into a species of melancholia, leading ultimately to death.

Courtly love has been subjected to a variety of uses and definitions. Crypto-Cathar, Neoplatonic, Marian, Ovidian, and Freudian theories may all be discarded as untenable. More plausible are the arguments of those who suggest it was a game, a secular code of conduct, or a poetic convention. In fact few subjects offer such a fertile ground for speculation—on the relationship between men and women, life and literature, fact and fantasy, courtly and popular, personal and conventional, profane and sacred, sensual and spiritual, and so on. Ambiguity is inherent in *amour courtois* because it is founded on the tense coexistence of erotic desire and spiritual aspiration; critics who focus on one element at the expense of the other are falsifying the picture. It was neither a mere cover for extramarital relations nor a purely spiritual ideal.

Courtly love was not, as some have claimed, a distinctively European phenomenon. All the main features mentioned above are found in the Arab tradition of chaste love, *hubb al-'udhrā*, formulated in Ibn Ḥazm's *The Ring of the Dove*, which can be traced back to the poetry of the Banū 'Udhrah (the Sons of Chastity), a seventh-century tribe renowned as martyrs of unrequited love, in particular to Jamāl al-'Udhra (d. 701). We may infer that *hubb al-'udhrā* was imported from Muslim Spain into southern France by musicians, singers, captives, refugees, and slaves. Sicily was also a channel of communication between East and West. However, as a result of the analogy of feudalism and other social factors, courtly love acquired a deeper significance in Europe than it had ever possessed among the Arabs. Factors that created a demand for conventions of love outside marriage included a shortage of women in aristocratic circles because of the upward social mobility of men, the improved status of certain

COURTLY LOVE

women whose crusading husbands left them in control of fiefs, and the existence of a "leisure class" with few military or material responsibilities. Thus courtly love did not remain confined to poetry and the world of the imagination; it not only left its mark on the values of polite society but eventually became the basis of marriage and gave rise to the modern concept of romantic love.

COVADONGA, BATTLE OF

A mountain cave in present-day Asturias near Cangas de Onís, Covadonga is roughly sixty-five kilometers east of Oviedo. According to the earliest preserved Asturian chronicles, it was the site (718/719) of the first battle between Muslim and Christian forces after the Muslim invasion of the Iberian Peninsula. The Christians emerged victorious, and it has thus been hailed as the beginning of the Spanish Reconquest.

The leader of the Christian forces is said to have been Pelayo, who through his success became the first king of Asturias (r.718/9–737). He is depicted as a refugee Visigothic noble who opposed a Muslim general named Alkhama. The chronicles, which draw on oral accounts, are highly dramatic. Pelayo, attempting to avoid a battle, took refuge on the edge of the Picos de Europa. There his force was discovered and surrounded by the Muslims. Christian bishop, Oppa of Seville, urged them to surrender, for resistance would be useless against the always victorious armies of Islam. Pelayo refused, placing his trust in divine aid, and claimed that the reconquest of Spain would begin there.

When the battle was joined, the spears and arrows of the Muslims, once they had reached the mouth of the cave that contained the chapel dedicated to the Virgin, were miraculously turned back against them. Great numbers of them were slain, and a sortie by Pelayo resulted in the death of Alkhama and the capture of Oppa. The remainder of the Muslim force attempted

to retreat to safety over the mountains, but was caught in a divinely inspired earthquake, and perished.

COYANZA, COUNCIL OF

A meeting of the magnates and bishops of the realm of and Castile summoned by Fernando I (1035/37–1065) and his wife, Queen Sancha at what is today Valencia de San Juan, thirty kilometers south of the city of León, in 1055. It was attended by seven bishops of the kingdom as well as those of Pamplona and Calahorra, from the tributary kingdom of Navarre. The thirteen canons that resulted apparently were promulgated by the monarchs.

The stated purpose of the council was to reform the church and the realm. Reform was understood in a quite traditional sense, and the canons of the council are based upon ancient collections: the *Hispana*, the *Liber iudiciorum* (*Fuero juzgo*), the *Breviarium* and the *fuero* attributed to Alfonso V of León (r. 999–1027). The council was at pains to underscore the authority of bishops and abbots in the church, to maintain the proper independence of the church from lay authority, and to ensure the use of correct liturgical practice. So far as the council was concerned with secular administration, its attention was directed largely to the observance of proper legal practice and obedience to proper legal authorities.

The acts of the council are preserved in two textual traditions. The earliest is that of the twelfth century *Liber testamentorum* of the cathedral of Oviedo. The other is in the thirteenth century *Livro preto* of the cathedral of Coimbra.

CRESCAS, HASDAI

Even for a scholar as important as Hasdai Crescas, a major figure in fourteenth-century Aragón and Catalonia, dates (ca. 1326–ca. 1412) and data of his life are uncertain. He was descended from a long line of Jewish scholars of Barcelona, and both his grandfather

(also named Hasdai) and his father, Abraham, are known from various sources.

Following in the footsteps of his grandfather, who was a government official in the service of Pedro IV (1326) and one of the six *adelantados* (secretaries) of the Jewish community of Barcelona, Crescas was an official of the same community. Sometime in 1370 or 1371 he, along with Nissim Gerundi, Isaac ben Sheshet, and other important Jewish scholars, was arrested by order of the king as a result of unspecified charges made against them by other Jews (probably angered at their strict interpretation of Jewish laws). Isaac ben Sheshet soon left Barcelona to become rabbi of Zaragoza, and Crescas succeeded him in that position (probably in 1385) when Isaac went to Valencia. Earlier, in 1359, Crescas had been in Perpignan, France, where he met Samuel Zarza, author of an important commentary on Ibn Ezra. It was probably while rabbi of Zaragoza, that he taught; among his students were Joseph Albo, Zerahyah ben Isaac ha-Levy (Ferrer Saladin), and Matityahu ha-Yishariy (all later participants in the famous Tortosa disputation of 1413). It should be noted that he was hardly the “chief rabbi” of Aragón—there never was such a position—but he was widely respected as one of the last great scholars of the kingdom. A letter purporting to be by Crescas, if authentic, is an important source for the events of the summer of 1391, when Jewish communities throughout Spain were attacked by mobs. We know that the king and queen took special measures to protect the Jews of Barcelona (and elsewhere), and particularly the family of Crescas, including his son and grandson. Therefore, the statement in the supposed letter of Crescas (somewhat difficult to understand) that his son and/or son-in-law was killed must either be rejected or understood to refer only to a son-in-law.

Crescas was the author of three works of which we know: *Or Adonai* (*Light of the Lord*), an anti-Aristotelian defense of the doctrines of Judaism completed in 1410; a work, possibly in Catalan, discussing and refuting ten “principles” of Christianity (this survived only in a Hebrew partial translation and synopsis); and a recently edited sermon on Passover.

It has been noted, however, that his theoretical work was composed both too late to make any impression on an already deteriorated and leaderless Jewish community, and too early for his more radical concepts to have been well received. The mass conversion of Jews to Christianity in the late fourteenth century and throughout the fifteenth century was in no way halted by his polemical writings or doctrinal defense. He was in fact, a leader who failed.

CRÓNICA DE ALFONSO XI

The *Crónica de tres reyes* (Alfonso X, Sancho IV, and Fernando IV) and the *Crónica de Alfonso XI* (1344) are attributed to Fernán Sánchez de Valladolid, Alfonso XI’s *notario mayor de Castilla y canceller del sello de la poridad* (Chief notary of Castile and Chancellor of the Privy Seal) This historical enterprise is the official continuation of the *Estoria de España* of Alfonso X and was sponsored by Alfonso XI toward the end of his reign.

The *Crónica de Alfonso XI* is considered to be of greater interest and quality than the *Crónica de tres reyes*. It draws on a variety of sources, the most important being its author’s personal recollections. The chronicler witnessed many of the events he narrates, but also draws extensively on information gathered orally—expressions such as “él que escribió esta estoria oyó decir” (he who wrote this history heard it said), and “el Estoriador oyó decir” (the historian heard it said) are common. His main goal is not just to write a biography but, rather, “contar de las cosas que acaecieron en los regnos de Castiella et de León en el tiempo deste Rey Don Alfonso” (to recount the events that occurred in the kingdoms of Castile and León in the time of King Alfonso). However, the chronicler occasionally narrates events that occur outside the king’s domains, such as truces in the Hundred Years’ War and struggles of pretenders to the Holy Roman Empire and the papacy.

Some of his material comes from archival documents, including the genealogies of the Moorish kings of Granada and of the Almohads. Internal evidence demonstrates beyond doubt that he held an administrative position in the royal chancery. The detailed information he presents on internal and external political affairs strengthens the case for Fernán Sánchez de Valladolid as the author. For example, the author describes in detail the negotiation of the alliance between Alfonso XI and the king of France, in which the chancellor played a leading role as ambassador. The author was very close to, and a devout admirer of, the king. Alfonso XI is always presented favorably, without defects. If the royal chronicler had any goal beyond praising the reign of his lord, it was to portray Alfonso XI

as a just monarch and to uphold the authority of the royal delegates who administered justice.

According to the chronicler the common people loved and admired the king; popular revolts were due to the ambition of the nobles. The king is also admired for his crusading spirit. At times of great difficulty God is always on his side, and miracles help him and the Christian troops. The chronicler tries to stay above personal infighting at the court, but occasionally there are glimpses of his personal preferences, as when he unfavorably presents Doña Leonor de Guzmán, the mother of the king's illegitimate children. Upon comparing this chronicle with the *Poema de Alfonso XI*—a text that was written by Rodrigo Yáñez in 1348 and covers many of the same events—one observes, for instance, the chronicler's dislike for Alvar Núñez de Osorio, an adviser to the king, and his sympathy for Pedro Fernández de Castro, "adelantado mayor de Castilla." Similarly he praises the Castilians and shows dislike for the subjects of other kingdoms, such as the Galicians.

Stylistically, although the *Crónica de Alfonso XI* is considered superior to the *Crónica de tres reyes*, it does not represent a great improvement in historiography. The chronicler prefers to describe rather than to explain. The order of the narration is chronological, and at times the author complains about his difficulties in properly narrating all the events that happened in different places at the same time. At one point, in an attempt to record every event of military importance, he organizes some of his entries by months. The only person who is described in detail is the king. This portrayal reveals the author as a man of letters. Among the most colorful descriptions, the knightings of the king in Santiago de Compostela and the coronation ceremony in the monastery of Las Huelgas stand out. Some other scenes of the king's life in periods of peace seem to have been influenced by the growing fashion for romances; for example, one sees the king hunting and participating anonymously in a tournament.

There are very few speeches in the text; most of them are short, and present the king's anger or his harangues to his troops. The chronicler asks his readers to bear with him and the length of his text. It seems that the chronicle was never completed, because it ends with the conquest of Algeciras (1344) and does not include the king's death (1350). This fact is quite striking, particularly because Fernán Sánchez de Valladolid survived his monarch by some ten years.

The anonymous author of the *Gran crónica de Alfonso XI* (written between 1376 and 1379) interpolated many sections from the *Crónica de Alfonso XI* and enriched his work with borrowings from the

Poema de Alfonso XI, Arabic histories, and other sources.

CUARTE, BATTLE OF

On 15 June 1094 the great Muslim city of Valencia, capital of a prosperous kingdom (*tā'ifa*), surrendered to the Castilian warrior and adventurer Rodrigo Díaz de Vivar, better known as the el Cid. It was a major defeat for Islam, and the Almoravid emir, Yūsuf ibn Tāshfīn, decided that it must be reversed. From Morocco, he dispatched forces that were joined by others of Muslim Andalusia, the whole under the command of his nephew, Muḥammad.

Faced with a much superior force, el Cid appealed to his overlord, Alfonso VI of León-Castile, for assistance. The Almoravid army reached Valencia about September 1094 and set up siege lines around the city. Before any reinforcements of his own had arrived, el Cid noticed that the enemy was lax in discipline and that some units had actually left for home. In October he staged a sudden sally that concentrated on the enemy camp at Cuart de Poblet, rolled up the entire Almoravid force, and effectively lifted the siege.

The victory ensured that the city and territories of Valencia would remain in Christian hands until the death of El Cid in 1099 and, for that time, prevented the spread of Almoravid power on the eastern coast north of Murcia. In 1094 it gave Alfonso VI the opportunity to employ the army he had raised for the relief of Valencia to raid deep into Almoravid Andalusia at Granada. Following to the death of el Cid, Valencia proved impossible to defend; it was evacuated in 1102 and occupied by the Almoravids shortly thereafter.

CURIAL E GÜELFA

Curial e Güelfa a fifteenth-century anonymous Catalan novel of chivalry. The first book relates how Curial, the son of a poor knight, gains the protection of the young widow Güelfa, the sister of his lord, the marquis of Monferrato. Some malicious *lausengiers* compel Curial to travel abroad. In Austria he overcomes the treacherous knights who had accused the duchess of adultery. Laquesis, the attractive sister of the duchess, is offered to Curial, who refuses her, although he cannot help falling in love. Güelfa feels offended even though Curial fights for her in a tournament held at Monferrato.

In the second book Curial is sent by Güelfa to Melun, in France, to fight against the greatest knights of the world. Curial easily overcomes them all, except for King Pere of Aragón. The hero once again meets the fair Laquesis and, confused by love and pride, for-

gets his fidelity to Güelfa. Thus Curial loses the protection of his beloved, who swears that she will never befriend him again until the whole French court gathered at the Puig de Nostra Dona pleads mercy for his sake.

In the third book the unhappy, fallen hero travels to the Holy Land and to Greece (in his dreams he even visits Mount Parnassus). On his way home Fortune decides to defeat him again: Curial's ship sinks and the young man is thrown onto Tunisian shores. For seven years Curial works as a slave on the farm of the Muslim Fàraig, whose pretty daughter, Càmar, falls in love with him. Curial avoids being seized by passion, and the girl, like Dido in Virgil's *Aeneid*, commits suicide after giving our hero a large treasure stolen from her father. Curial reaches Monferrato again, but Güelfa refuses to listen to the song he has written for her, *Atressi com l'aurifany* (which actually is the work of the twelfth-century troubadour Rigaut de Berbezilh). Finally Curial assembles an army to fight against the Turks, who have recently invaded Europe. In a successful battle he rescues the lord of Monferrato from the enemy; as a result he finally attains the highest glory, and the French court obtains Güelfa's mercy for him.

Whereas the first two books of the novel recount events from a realistic point of view, the last one includes a strange learned mythological background that enables the anonymous author to produce a moral interpretation of his hero's behavior.

D

DANCE

Although the tradition of dance had become well established in the Middle Ages, most of its repertoire has since been lost because it consisted mostly of instrumental music, which was not customarily written down until well into the fifteenth century. Nevertheless, chronicles and archival documents do make reference to specific dancers. The earliest reference concerns a master of Jewish dance, Rabbi Hacén ben Salomo, who in 1313 performed a circular dance in the Church of San Bartolomé in Tauste, Zaragoza. Quite different were the ten *dansas* (a type of troubador song) with vocal accompaniment that the *infante* Pedro composed and performed during a banquet celebrating the coronation of his brother, Alfonso IV of Aragón, in the Aljafería of Zaragoza in 1328. Ramón Muntaner, who chronicled the event, says that the city celebrated the event in the streets with “dances de dones e de donzelles e de molta bona gent” [“dances of young men and women and many good people”]. In the *Libro de Buen amor*, the Arcipreste de Hita claims to have written many dance compositions fit to be performed by different instruments (“muchas cantigas de dança e troteras,/ para judías e moras”). These might have resembled those heard in Burgos when Alfonso XI, King of Castile and León, was knighted: on that occasion, in the words of Rodrigo Yáñez, “ricas dueñas fasían dança/ a muy gran plaser cantando” [“Many fine ladies danced/and sang with pleasure”] (*Poema de Alfonso*).

The Aragónese monarchy showed constant fondness for dance. In Pedro IV’s court there were at least two “trobadors de dances,” Jacme Fluvia of Mallorca and Pere de Rius. Given Juan’s exclusive interest in French music, it is quite possible that the dances performed for him followed French models; the manner of dancing “a la françessa,” which Alfonso Alvarez de Villasandino mentions in a poem to the queen, Leonor de Navarra, would be characterized by the *rondel*, *virelai*, and *estampida*. Martín I of Aragón preferred a group of female Moorish dancers—*alfuleys*—that

served in his court: the king describes one performer (Foix) wishing to join the troop in 1406 as “apta balladora.” These women were from Valencia, as was Graciosa, the most famous Spanish *bailadora* of the era. In 1409 she was serving in the court of the Queen of France, but after traveling to Navarre and Castile, in 1417 Graciosa entered the service of Alfonso V (“the Magnanimous”), who paid her at the rate of two *sueldos* daily, just one less than he paid his marshals. In that same year, Alfonso ordered that twenty-five gold *florines* be sent to “Nutza la balladora, mora juglaressa de Valencia.” In 1418 another group of “moros balladors” served in Alfonso’s court: this troop consisted of the Valencian dancer Moratxo, his wife Uzey, their son Abdalla, and his wife Muzeys. The following year, the king sent for certain “moratelles balladores” who he wanted to see perform; later, in 1425, Alfonso requested that certain “moros e moras balladores de Xativa” join his court. The king’s favorite performer, however, was Catherina “la Comare,” a singer and dancer who was at Alfonso’s service from 1417 to 1424, and who often danced dressed in Moorish costume despite the occasionally adverse reactions of the audience. She performed accompanied by her husband Johan de Muntpalau, a lutist and guitarist.

When the Aragónese royalty travelled to Valencia, it was welcomed by processions that always included musicians and “dançadores” from the city’s guilds. The repertoire of these popular dances was probably quite different from the compositions contained in the *Llibre Vermell* de Montserrat, dating from about 1400. This collection of compositions, designed to entertain the pilgrims that visited the monastery at Montserrat, included four circular dances accompanied by lyrics with Marian themes: *Los set gotxs*, *Cuncti simus*, and *Polorum regina*, all performed “a ball redon” with one voice; and *Stella splendens*, a *virelai* performed “ad trepidum rotundum” with two voices. The choreography of the *Llibre Vermell* could very well be reflected in one of the miniatures of the T codex of the *Cantigas*

de Santa María of Alfonso X; the illustration accompanies cantiga 5 and portrays a group of faithful dancers holding hands in a circle in front of an image of the Virgin. Another composition from the *Llibre Vermell* is *Ad mortem festinamus*, the oldest example of a dance of death whose music is preserved: subsequent versions of Spanish or Catalan *danzas de la muerte* are strictly literary. The Maundy Thursday procession celebrated in Verges (Girona) includes a dance—possibly with origins tracing back to the fourteenth century—in which Death takes part; it is performed by five individuals dressed as skeletons and consists of three rotating steps.

The first reference to the *baja danza* appears in Francesch de la Vía's poem *La senyora de valor* (1406). Both the *alta* and *baja* dances were fashionable in Spain throughout the fifteenth century. For example, in the descriptions in his *Crónica* of the parties given at the palace of Jaén, Miguel Lucas de Iranzo, Constable of Castile, mentions several times that *chirimías* and other instruments played "baxas e altas" on a raised wooden platform at one end of the dance hall. While in Fuenterrabía in 1462, the ambassador of France danced "la baxa e la alta" with Doña Juana of Portugal, Enrique IV of Castile's wife; the hero of the anonymous novel *Curial e Güelfa* (c. 1450) performs the "baxa dança" at each of the parties he attends. The *Cancionero musical de Palacio* (c. 1500) includes one *alta* written for three voices by Francisco de la Torre in which the tenor voice coincides melodically with the famous *baja*, *La Spagna*. A dance manual printed in Toulouse around 1480 displays the choreography for *La Spagna* under the title *Casulle la novelle* [sic]; it also includes choreography for another *baja*, *La beauté de Castille*, whose melody was also incorporated in a collection of *bajas* compiled during the time of María de Borgoña, wife of Maximilian I of Austria. The same collection contains *La basse danse du roy d'Espagne*, probably referring to Juan II of Castile, whose *Crónica* says that he danced very well ("danzaba muy bien"). A Catalan manuscript of 1496 reproduces the choreography of several dances dating from the second half of the fifteenth century, including *La Spagna* or *Baixa de Castilla*.

DANTE ALIGHIERI

Along with Francesco Petrarca and Giovanni Boccaccio, Dante Alighieri (1265–1321) formed part of a triumvirate of Italian authors who provided the inspiration for new ways of writing and thinking about literature in later medieval Iberia. The earliest direct influence of the *Divina commedia* (Dante's other works left little or no impact) is to be found in the allegorical verse of Francisco Imperial, a member of the Genoese colony in Seville in the early fifteenth century. However, the close links between Aragón and Italy meant that admiration for Dante was at first more notable in authors connected with the Aragónese courts. The poet Andreu Febrer undertook the first complete translation of the *Divina commedia* into Catalan (1429), an accurate and fluid rendering with evident literary pretensions. An Aragónese nobleman, don Enrique de Aragón (Enrique de Villena), also attempted the first Castilian translation (1427–1428, *Inferno* only). Unlike Febrer, Villena conceived his version as a literal guide to the Italian original and had it transcribed in the margins of a manuscript of the *Commedia* owned by Íñigo López de Mendoza, the marqués de Santillana. The latter's marginalia indicate how Dante was plundered as a source of moral and political sententiae: a characteristic of medieval and early modern reading practice that is also found in a manuscript fragment of the *Inferno* with fifteenth-century Catalan glosses. But evidence for other modes of reading—at least on Santillana's part—comes from his copies of Castilian versions of the commentaries by Pietro Alighieri (anonymous) and Benvenuto da Imola (*Purgatorio* only, by Martín de Lucena). Santillana also owned an anonymous translation of the *Vite di Dante e Petrarca* by Leonardo Bruni. Although the commentaries by Jacobo de la Lana and Cristoforo Landino were known in Spain—the former is used by Villena, the latter by later translators (see below)—the commentary by Benvenuto da Imola seems to have been the most favored, being cited for example by Juan de Mena in the preface to his *Coronación*, and in the anonymous Castilian translation and gloss of first two cantos of the *Commedia*. Around 1500, Pedro Fernández de Villegas, archdeacon of Burgos, translated the *Inferno* for King Fernando's daughter, Juana de Aragón. Printed in Valladolid (1516), this verbose amplifi-

cation into *arte mayor* stanzas was continued by an anonymous translator who experimented with octosyllabic verse (*quintillas* and *tercets*) to provide a more succinct version that would correspond more closely to Landino's commentary. Allusions to Dante are common in late medieval Catalan and Castilian poetry, though there is little substantive influence on a textual level. There are exceptions, such as the verse of Francisco Imperial, but for the most part, reminiscences of Dante are rhetorical or tonal in nature, as in the portentous allegorical verse of Mena (*Coronación, Laberinto de Fortuna*) and Santillana (e.g., *Infierno de los enamorados*). On the whole, the latter's comment that Imperial was not a *trobador* but a *poeta* is symptomatic: Dante provided a model for the new notions of vernacular authorship that were gaining ground in the later Middle Ages. Whether or not he was read outside fairly narrow circles of literati, the name Dante was part of the cultural baggage of lay poets who aspired to compose verse with transcendental pretensions.

DECRETALS See LAW, CANON

DESCLOT, BERNAT

Desclot is the author of the Catalan chronicle *Llibre del rei en Pere d'Aragó e dels seus antecessors passats*. Miquel Coll i Alentorn put forward the hypothesis that Desclot was an officer of the royal chancellery and a member of the Escrivá family from the Rosselló. Desclot's chronicle, written between 1283 and 1288, it is one of the oldest Catalan texts. The first eleven chapters include some dynastic legends (the establishment of the house of Barcelona in the Crown of Aragón, the birth of the great king Jaime I, Count Ramón Berenguer IV's rescue of the German empress, and the Aragónese rights to Provence). These episodes furnish the ideological background to a book conceived as a glorification of the Aragónese monarchs. Desclot narrates the life of Jaime I the Conqueror (r. 1214–1276), but his work is particularly centered on the reign of

Pedro II the Great (r. 1276–1285). In this part of the chronicle, in spite of his enthusiasm for the chivalric nature of King Pedro, Desclot clearly used contemporary documents to compile his narrative (only once does he claim to be an eyewitness).

The most famous episode of Pedro II's life was his military expedition to Sicily, where he went to accept the crown offered to him as a result of the Sicilian Vespers (1282). Even though Charles I of Anjou, the deposed king of the island, persuaded the church to excommunicate the Catalan army, Pedro II's brave warriors (chiefly the *Almogávares*) managed to defeat the French. Desclot also narrates individual deeds of the king, such as his successful journey to Bordeaux in disguise to fight against the treacherous Charles of Anjou, and describes the invasion of Catalonia by the French crusading armies in their attempt to place Charles of Valois on the throne instead of Pedro II (1285). The chronicler does not avoid crude details in his descriptions of the bloody battles fought by the Aragónese navy, or the pursuit through the Pyrenees of the French army, which was suffering from a bad epidemic. Desclot's patriotism is best exemplified by the story of Pere II's Sicilian admiral, Roger de Llúria, who after the French defeat firmly refused an onerous treaty suggested by the Count of Foix. Llúria was sure of his strength because, he said, even the fish in the Mediterranean would now be wearing on their tails the red and golden stripes of the Aragónese flag.

DIAS, BARTOLOMEU

It is not known when or where this Portuguese navigator was born. Certainly he came from a family with some maritime tradition, for an ancestor was Dinis Dias e Fernandes who explored the North African shore in the 1440s and discovered Cape Verde in 1444.

Ptolemaic and medieval Italian conceptions of the disposition and shape of the Euro-African landmass had led cartographers to grossly underestimate the extent of the African continent. It was probably in the wake of the frustration felt by the Portuguese king João II, when the second expedition of Diogo Cão (1485–1486) revealed a seemingly unending coastline southward, that another expedition was immediately

ordered, with Dias as its commander. His fleet consisted of two caravels and a supply ship captained by his brother Diogo.

The fleet left Lisbon in August 1487 and reached the farthest point attained by Diogo Cão (Cape Cross in modern Namibia) in early December. According to some accounts prolonged stormy weather then drove the fleet out of sight of land. In the event, Dias ran, heavily reefed, before the southeast trade winds and, then, at approximately forty degrees south latitude, encountered the Antarctic westerlies, which enabled him to turn to the northeast and make his first landfall, probably in Mossel Bay. He continued eastward as far as the Great Fish River, although his main stop was in Algoa Bay. Here, mindful of serious discontent among the half-starved crew, his fellow officers may have forced a reluctant Dias to turn for home.

On the return journey he discovered the southernmost tip of Africa, Cabo das Agulhas, where he experienced very bad weather. Thus, that when he reached False Bay, he named its promontory Cabo Tormentoso (Cape of Storms); he, or possibly King João, subsequently renamed it Cabo da Boa Esperança (Cape of Good Hope). He reached Lisbon in December 1488 but was received with none of the pomp and munificence enjoyed by his predecessor Diogo Cão or his successor Vasco da Gama. He later took part in Gama's voyage in 1497 and that of Pedro Alvares Cabral in 1500. He died on Cabral's expedition when his ship sank in heavy seas off the Cape of Good Hope.

Dias was the first European navigator to sail entirely out of sight of land in the southern hemisphere, discovering in the process the southeast trades winds and the westerlies; he confirmed that all existing maps of Africa were erroneous, and effectively opened up the sea route from Europe to Asia.

DÍAZ DE GAMES, GUTIERRE (EL VICTORIAL)

Only one other fifteenth-century Castilian biography, that of Alvaro de Luna, is comparable in extension and importance to *El Victorial*, the only known work of Gutierre Díaz de Games. Written in an elegant, lively style, the work's lucid prose is enriched by rich nautical vocabulary, painting an expressive tableau composed of both real and imaginary scenes of chivalric life. This biography of Pero Niño, Count of Buelna,

is historically authentic; but as a panegyric that exalts its subject to heroic levels, it also becomes a literary narration synthesizing the fifteenth-century European chivalric ideal of victory.

The author makes his presence known at the end of the *proemio*, manifesting not only his close, dependent relationship with Pero Niño but also his privileged position as a reliable witness of the "todas las más de las cavallerías" (*all the other forms of chivalry*) that will be narrated in the text. His position as naval lieutenant would not be incompatible with his career as notary; it seems probable, therefore, that he is the same Gutierre Díaz, notary to the king, who acted as diplomatic ambassador on various occasions during the regency of Fernando de Antequera and the reign of Juan II. The environment of the royal chancellery would have been favorable for the production of what Juan Marichal has called Gutierre Díaz's "voluntad de estilo."

It is commonly believed that Díaz started *El Victorial* in 1435, the year of Pero Niño's last will and testament, which contains a note about the work's commission and destination. However, the author may have begun the biography as early as 1431, when Pero Niño was named Count of Buelna. The work would likely have been finished (save perhaps some of the supplementary material) no later than 1436.

An extensive doctrinal and historical *proemio* opens the text as a means of justifying the novelty of the biographical story. Pero Niño's life will serve as a specific noble and Christian *exemplum* in a chivalric treatise ("tratado de caballería") that had universal appeal. The *tratado* itself, dedicated to narrating the count's life, is divided into three parts. The first relates Pero Niño's lineage, birth, childhood, education, the initiation of his career, and his first marriage.

Díaz shrouds Pero Niño's birth with an aura of legend facilitated by the fact that Enrique III was born around the same time and that Pero Niño's own mother served as the king's wet nurse. In this way the author infers a sort of "blood brotherhood" that is later ratified as the two boys are brought up together at court. To emphasize the count's education, the author incorporates a fragment of the *castigos* used by an anonymous master to indoctrinate the boy. The chapters dedicated to Pero Niño's initiation into knighthood continue incomplete scenes or add details that are absent from Ayala's chronicles; they also add new motifs to the chivalric biography genre, such as the precocity of the hero, the appearance of good omens, fights against animals, the petition of the king's weapons during first battle, or the comic challenge made to a foreign giant. The protagonist's physical and moral portrait precedes his marriage to his first wife, Constanza de Guevara,

which is embellished with a curious discourse on the degrees of love.

The second part relates the expeditions that Pero Niño made to the Mediterranean and the Atlantic as captain of the Castilian fleet between 1404 and 1406. The essentially truthful nature of the historical events narrated in these sections is confirmed through the detail of some of the diary like episodes, that mark the passing of time day by day. Gutierre Díaz takes advantage of Pero Niño's arrival in England to introduce the fictitious "History of Bruto and Dorotea," pushing the chronicle once more into novelistic territory and seasoning the Pero Niño's already notable exoticism with shades of legend. The second part ends with a summary of the knight's participation in the first year of the War of Granada (1407).

The third part tells of the travails of the count's life up to his death. Of particular interest is the chapter on Pero Niño's "conquest" of Beatriz de Portugal, who would become his second wife. The author also includes an exonerative version of Pero Niño's participation in the sacking of Tordesillas, in which Juan II was retained by the *infante* Enrique and his men. The biography ends with a brief description of Pero Niño's exile to Aragón, a result of his support of Enrique's faction; his return and recuperation of the king's trust; a summary of the life of his ill-fated firstborn son, Juan; and passing references to the count's interventions in other military affairs.

Even though it is a fifteenth-century biography, the first representative of a genre associated with the dawn of the Renaissance, *El Victorial* does not display even the slightest humanist influence in its treatment of fame and the biographical subject, nor a trace of knowledge of or curiosity for the classics. Díaz constructs a perfect chivalric world, without fissures, that seems destined to ward off the political and ethical disorder of the real world. He makes use of the basic procedures of the chronicle narrative and the compositional organization of chivalric fiction. The unique characteristics of *El Victorial* arise precisely from the way in which the author attempts to assimilate the aristocratic conceptualization of life. Therefore, the work is as contradictory as it is harmonic, as disconcerting for the collector of objective past facts as it is attractive for the cultural and literary historian.

DÍAZ DE MONTALVO, ALFONSO

Born early in the fifteenth century in Arévalo (Segovia), Díaz de Montalvo as a child moved with his family to his permanent home in Huete (Cuenca). At the universities of Salamanca and Lérida he studied canon and civil law, obtaining his doctorate from Salamanca (1464/1672). Under Juan II he served as the king's representative (*corregidor*) in Baeza and Murcia (1444–1445), as delegate (*procurador*) from Huete to the *cortes* (parliament) of 1448, and in other judicial capacities both temporary (*pesquisidor*, *juez comisario*, in Madrid, 1453–1454) and permanent (*oidor*). Under Enrique IV, Díaz de Montalvo was named *asistente* of Toledo (1460–1461, 1463–1464), *gobernador* and *alcalde mayor* of the Order of Santiago, and member of the Royal Council. Fernando and Isabel commissioned him to produce a compilation of laws that would cover legislation from the time of Alfonso XI on. The result was the *Copilación de leyes* (1484), also known as the *Ordenamiento de Montalvo* and the *Ordenanzas reales de Castilla*. The work enjoyed wide diffusion (eight other incunabula editions are verified) and was used in legal studies through the first half of the sixteenth century. Modern scholars disagree on the authority and legitimacy of the work (both of which, on

the weight of the evidence, seem most likely) and its promulgation (more improbable than not). The principal defect of the work lies in Díaz de Montalvo's personal selectivity and formulation of items according to unstated criteria, sometimes without regard to the validity of a particular disposition, let alone to full quotation.

Díaz de Montalvo also prepared glossed editions of the *Fuero real* (Seville, 1483, and at least eleven others, of which three are incunabula) and the *Siete Partidas* (Seville, October 1491, and at least six other verified editions, one from December 1491 and the rest from 1501 to 1550), both of which suffer from the same inadequacies as the *Copilación*. He also prepared two dictionaries: for canon law the *Repertorium quaestionum super Nicolaum de Tudeschis* (1477, and five more incunabula), and for civil law the *Repertorium seu secunda compilatio legum et ordinationum regni Castellae* (Salamanca, ca. 1485; two other verified incunabula editions; and at least two sixteenth-century editions). Additional works deal with the Royal Council (*De concilio regis*), glosses of the *Leyes del estilo* (Salamanca, 1497), and other legal topics. Díaz de Montalvo's will is dated 1496, and he is said to have died in 1499.

DÍAZ DE VIVAR, RODRIGO

Rodrigo Díaz was born at Vivar, near Burgos, in 1043, the son of the *infanzón* Diego Laínez. Because of his noble status and the protection of his maternal uncle, Nuño Álvarez, he was reared in the household of Infante Sancho, the son of Fernando I. He accompanied Sancho on his expeditions to protect the petty Muslim king (*tā'ifa*) of Zaragoza against the attacks of Ramiro I of Aragón, whom they defeated at Graus (1063). When Sancho II ascended the throne of Castile (1066), he named Rodrigo royal *alférez* (*armiger regis*, or standard bearer). As such he participated in quarrels with the neighboring kingdoms: a dispute with Navarre over the castle of Pazuengos, in which he gained the nickname *Campi doctor* or *Campeador*; an expedition against the *tā'ifa* of Zaragoza, who had stopped paying tributes (*parias*) to Castile (1067); the battles or "judgments of God" at Llantada (1068) and Golpejera (1072), fought by Sancho II and his brother, Alfonso

VI of León, to determine to whom the thrones of Castile and León belonged. Sancho won both battles. Rodrigo's deeds during the siege of Zamora, which supported Alfonso, were extolled in legend. The assassination of Sancho II during the siege (October 1072) forced the Castilians to accept Alfonso as king, although Rodrigo and his followers required him first to swear an oath of purgation, in the Germanic fashion, that he had had no part in Sancho's death and had not plotted it. Rodrigo Díaz became a vassal of Alfonso but lost his important position at court.

In 1074 the king arranged a very advantageous marriage for him to Jimena Díaz, daughter of the Count of Oviedo and great-granddaughter of Alfonso V. At the end of 1079 he went to Seville to collect tribute owed by that *tā'ifa* to Alfonso VI. In 1081, as a consequence of an incursion that he made into the *tā'ifa* kingdom of Toledo, under Leonese protection, and the accusations made against him by Count García Ordóñez and other courtiers, Alfonso VI declared him subject to the *ira regia* (royal wrath), compelling him to go into exile.

Rodrigo's exile with his retinue interrupted his courtly career and launched him on enterprises in which he showed his capabilities and gained fame as well as the nickname El Cid (lord). He rendered military services to the *tā'ifa* of Zaragoza against King Sancho Ramírez of Aragón and Navarre (whom he routed in 1084) and against the Count of Barcelona and the *tā'ifa* of Lérida. After the African Almoravids' first invasion of al-Andalus and their rout of Alfonso VI at Zallāqah (1086), the king received Rodrigo again (in the spring of 1087) and entrusted him with the mission of protecting the *tā'ifa* of Valencia, al-Qādir, formerly king of Toledo. In 1089, when the *tā'ifa* of Zaragoza and the Count of Barcelona besieged Valencia, El Cid received from Alfonso VI all the lands that he might conquer in the eastern part of the peninsula, to be held by hereditary right. He lifted the siege of Valencia, using as a base of operations Albarracín, whose *tā'ifa* resumed payment of tribute to Castile.

The second Almoravid invasion (autumn of 1089) resulted in Rodrigo's disgrace once again because he was unable to relieve the advanced Castilian position at Aledo in the southeast. At the beginning of 1090 he consolidated his protectorate over Valencia when he routed and captured the count of Barcelona near Morella (Battle of the Pines of Tévar), dissolving his coalition with the *tā'ifas* of Lérida, Albarracín, and Zaragoza. The Almoravid conquest of al-Andalus after 1090 required Rodrigo, again in royal favor on various occasions, to strengthen his dominion in the east, thereby covering one of the flanks of the kingdom of Toledo and of all Castile, and blocking the coastal road

to the Ebro valley. In the face of this danger, the *tā'ifa* of Zaragoza and Sancho Ramírez of Aragón allied against him. Alfonso VI, who tried to take Valencia in 1092, entrusted the defense of Christian interests in that zone to Rodrigo. Al-Qādir of Valencia was deposed and killed by the Valencian *qādī* Ibn Jahhaf, with Almoravid help. El Cid, with the aid of anti-African Muslims and of the Mozarabs, occupied Valencia and repelled the Almoravid relieving army (Battle of Cuarte, October 1094).

The Cid established himself as "lord of Valencia" and supreme judge, by hereditary right, maintaining his fidelity to Alfonso VI; he coined money and resided with his troops in the citadel of the city. He established a regime of coexistence, allowing the Muslims to keep their property, their system of taxation, and religious liberty, although they surrendered their arms. Former rebels were relocated to the suburb of Alcudia. After the Almoravid attack in January 1097, their defeat in the Battle of Bairén, and the capture of Murviedro (modern Sagunto) in 1098, Rodrigo converted the mosque into a cathedral (the first bishop was a Frenchman, Jerome of Perigord). To consolidate alliances he arranged the marriage of his daughters Cristina and María to Infante Ramiro of Navarre and Ramón Berenger III, Count of Barcelona, respectively. He died 10 July 1099 without a male heir, and Valencia fell to the Almoravids in 1102. Thus the route to the northeast was opened, and Castile's effort to consolidate its dominion in the east was nullified.

Rodrigo quickly became an epic personality, although the memory of his historical existence was not lost. He was a military genius, a hero formed by exile and adventure during the difficult years of the Almoravid invasion; he represented to perfection the values of chivalry and vassalage, the spirit of the frontier, and coexistence between Christians and Muslims, under the aegis of the king-emperor of León and Castile.

DIDACTIC PROSE, CASTILIAN

Definition

There is no standard definition of didactic literature. It often suffers from being viewed as a miscellaneous genre, defined negatively as what remains of

literature when narrative, lyric, and (possibly) the religious genres have been subtracted. In this view its postmedieval successors are the discursive genres, the essay, and belles-lettres, in which substance is poorly focused or subordinate to form.

For our purpose didactic literature is taken to be the literature that teaches either morals or facts. It includes wisdom literature, mirrors of princes, *exempla*, and didactic romances. In accordance with a modern critical tradition of doubtful validity, it excludes history, biography, and hagiography but includes a number of works, such as legal texts that, when they occur in postmedieval writing, are regarded by critics as subliterate or nonliterary. Some such works are so plain as to be artless, but they may also include, generally in an illustrative or corroborative capacity, elements such as anecdotes that would be regarded as literature.

Theory

The concept of didacticism is recognized in classical definitions of the function of literature. "Teaching" figures in the pair *docere ornare* (Quintilian, *Institutio oratoria*, 9.4.127) and the triad *docere/delectare/movere* (Quintilian, *Institutio*, 3.5.2; 8 *prooem*, 7; hence Martianus Capella 5.473). "To teach" in these classical examples seems always to denote the conveyance of factual information; in medieval formulations "to teach" usually means to teach good ways.

Very often (given the medieval tendency to view the world in terms of issues rather than phenomena), the ethical and factual categories overlap. For example, Juan Manuel's *Libro de los estados* is notionally a sociological description of the estates of men, but is actually concerned with saving one's soul within one's estate. In the *Arte cisoría*, Enrique de Villena prescribes not only the professional but also the moral formation of the carver: one is reminded of Cato the Elder's description, picked up by Quintilian, of the orator as "a good man skilled in speaking" (*Ad filium*, 14). Similarly the mentality of the bestiary, reflected in Juan Manuel's *Libro del cavallero e del escudero*, or of the medieval historian gives moral interpretation a status equal or superior to that of the relation of facts.

The didactic frame of mind is also important in the reception of texts: the reading of literature as a source of facts or as the occasion for moral commentary, sometimes allegorical, was already established in the schools in antiquity, and encouraged by St. Paul's dictum, "All that is written is written for our doctrine" (Rom. 15:4, translated by Chaucer). The *Siete Partidas* is didactic in both senses: besides its practical intent, they it was used as material for moral works on chiv-

alry. The double function of legal texts is encapsulated by the citation of the Horatian tag *Omne punctum tulit qui miscuit utile dulci* [Every point that combines the pleasing with the useful is well taken] (*Ars poetica*, 343) and the claim to benefit both body and soul in the prologue to the *Fueros de Aragón*. The popularity of such an attitude is shown by the use of the promise of moral teaching as a selling point on early title pages such as that of *Celestina*, and by the fact that, in surviving inventories of libraries and in the output of the early printers, didactic works outweigh lyric and romance works.

An essential feature of the genre is its seriousness; the unambiguous meaning is paramount. Juan Manuel insists on clarity as the basis of style: "Más de consentir et más provechoso para el que ha de aprender es en ser la scriptura más luenga et declarada que non abreviada et escura; ca el que aprende, entre todas las cosas que ha mester, es que aya vagar para aprender" [Clearly developed and openly declared writing is more beneficial and to be encouraged for those who are to learn, rather than tense, obscure writing; he who learns, must above all, have the space in which to do so] (*Libro de los estados*, I, 1xiv).

Prose

Isidore of Seville calls prose "an extended utterance free from metrical rules" ["producta oratio et a lege metri soluta"] (*Etymologies*, I.38.1). This is the ultimate source for the marqués de Santillana's reference in the *Prohemio e carta* to "la soluta prosa." Isidore goes on to give the etymology of prose as "extended and straight" and declares the chronological priority of prose over verse. This last point is generally accepted as regards Castilian literature. The earliest use of prose in its modern sense in Spanish may occur in the first translation of the *Consolation of Philosophy*.

Factual Works. Whereas factual verse is common in French, English, and other medieval languages, in Spanish factual material is largely in prose. The schema of the sciences that the Florentine Brunetto Latini (*Tesoretto*, I, 3–4) developed in the thirteenth century out of Aristotle and Isidore provides a background against which to place the various factual works. Philosophy is divided into theory, practice, and logic. Theory is divided into theology, physics, and mathematics, and mathematics is subdivided into arithmetic, music, geometry, and astronomy. Practice is divided into ethics, economics, and politics. Politics is subdivided into the mechanical arts and what in other schemes is called the trivium (grammar, dialectic, and rhetoric). Logic is divided into dialectic, physics, and

sophistics. These topics are not evenly represented in Old Spanish, and while some subjects are present in the vernacular corpus from the beginnings, others are not found until the fifteenth century.

In theology there are plenty of religious texts, generally works of devotion meant for the layman rather than for the specialized religious reader. In physics there is a substantial corpus, not earlier than the fifteenth century, of medical works, including Villena's *Tratado de la lepra*. Although it concerns natural history, the *Lucidario* commissioned by Sancho IV proposes a religious interpretation of its material expressly in opposition to the rational sciences. There are some "natural questions" in *La Donzella Teodor*. In mathematics arithmetic, music, and geometry apparently have no Old Spanish texts. Astronomy is present in the vernacular as early as the Alfonsine corpus. (Ethics is discussed in "Books Teaching Morals," below.)

Economics (the art of running a household) is represented at the practical level by Villena's *Arte cisorio* and at the theoretical level by much of wisdom literature. Politics is covered by the mirrors of princes; Rodrigo Sánchez de Arévalo's *Suma de la política* is partly indebted to this genre.

Juan Manuel's claim (in the prologue to the *Libro de la caza*) that Alfonso X had translated all the liberal and mechanical arts is not borne out by the surviving Alfonsine corpus. There is nothing in Old Spanish on weaving, *armatura* (the plastic arts and architecture), or *theatrica*; perhaps travel books may be placed under navigation (which includes trade). Although there were Old Catalan treatises on agriculture, there apparently is nothing in Castilian. Hunting is well represented in Old Spanish from the beginnings. Medicine, which appears twice in Brunetto Latini's schema, is treated under physics. Villena includes his *Arte cisorio* among the mechanical arts.

Grammar seems not to be represented by vernacular works before the fifteenth century, when Villena's *Arte de trobar*, with some discussion of grammar, and Antonio de Nebrija's *Gramática* appeared. Rhetoric, according to Latini, includes preaching, Scripture, and law. Rhetoric proper and poetics are dealt with in Juan Alfonso de Baena's *Prologus baenensis*, Santillana's *Proemio*, Villena's *Arte de tro bar*, and Juan del Encina's *Arte de poesía castellana*. Vernacular works on sermonizing are lacking. Scripture is covered by works of exegesis, such as Villena on Psalm 8, *Quoniam videbo*; but the vast bulk of biblical scholarship, such as Alfonso Fernández de Madrigal's commentaries, is in Latin. Law, by contrast, was one of the first categories to be transferred to the vernacular (doubtless for practical reasons). On logic and its subdivisions there is nothing.

There is a considerable corpus of courtly material. To hunting may be added works on other courtly issues: chivalry is studied by a number of authors, among them Valera, indebted to the *Partidas*. There are works on heraldry by Juan Manuel (*Libro de las armas*), Juan Rodríguez del Padrón, Diego Valera, and Juan de Mena (*Tratado sobre el título de duque*). Courtesy literature seems underrepresented in Spanish: a rare example is Villena's *Arte cisoria*. Chess is treated in Spanish as early as Alfonso X. Magic and alchemy are represented by the Alfonsine *Lapidario* and Villena's *Tratado del aojamiento*.

Spanning all these topics are the encyclopedias: the *Visión deleitable* of Alfonso de la Torre (a best-seller) and the much smaller scale *Libro del cavallero e del escudero* of Juan Manuel, as well as translations of Isidore, Latini, and Bartholomaeus Anglicus.

Why this uneven distribution? Some subjects may have been too technical for the vernacular; others may have been considered too lowly to be committed to writing and were transmitted orally. Thus, although in Italian there are such works as Cennino Cennini's late fourteenth-century manual for painters, in a less literate society such knowledge would have not been written down.

Books Teaching Morals. The difference between the exemplum and the didactic romance (*Barlaam* and *Josaphat*, *Zifar*) is not simply length. The characters in the exemplum are defined by wisdom or folly; in romances they are defined by a broader range of virtues and vices.

Although there were Castilian translations of John of Wales and the *Fiore di virtù*, summa on virtues and vices are rare in Spanish outside the mirrors of princes. The utilization of, for example, the *Moralium dogma philosophorum* in vernacular works shows that in at least this case Spaniards handled Latin manuals without the aid of translations. There is a body of preserved vernacular sermons; indebted to the sermon tradition is the *Corbacho* of Alfonso Martínez de Toledo. In the fifteenth century a variety of essayistic works on moral themes appeared: allegories (Villena's *Doze trabajos de Hércules*), dialogues (Juan de Lucena's *De vita beata*; *Diá logo de Cipión y Haníbal*), and Senecan epistle-essays (Hernando de Pulgar's *Letra* and Villena's *Tratado de la consolación*).

History and Stylistic Development

The earliest monuments of Spanish prose are, as elsewhere, paraliterary. The first examples of literary prose (thirteenth century) are didactic works translated from or modeled on Arabic or Hebrew at the Castilian court. The Alfonsine works were influential throughout the Middle Ages.

Broadly speaking, Whinnom was right to insist on the lack of a continuous tradition of Spanish prose. However, comparing the beginning of the vernacular period with the end of the Middle Ages, we might note a tendency away from Semitic parataxis and toward Latin periodicity, perhaps reflecting a movement away from oral to written culture. Indeed, some Alfonsine sentences are positively antiperiodic, with the strongest idea at the beginning, with the rest tailing away: "Fuerç nin premia non deuen fazer en ninguna manera a ningund judio por que se torne cristiano, mas con buenos exiemplos e con los dichos de las Santas escripturas e con falagos los deuen los cristianos conuertir a la fee de Nuestro Sennor Jhesu Christo, ca Nuestro sennor Dios non quiere nin ama seruicio quel sea fecho por premia" ["Force or coercion of any kind should not be brought to bear upon any Jew to turn Christian; rather he should be converted to the faith of Our Lord Jesus Christ through good examples and the sayings of Holy Scripture; Our Lord God does not love service rendered through force."] (*Partida* 7, xxiv. 6). In some cases authors use grammatically hypotactic structures in sentences that give equal status to all members in a way typical of parataxis: "El qual Anfiarao se escondio por non ir a conplir el su sacerdotal oficio en la batalla, enpero que non sopo otro ninguno de como se escondiera salvo su muger Erifile, la qual convencida por dones de oro mostro e descubrio el lugar donde Anfiarao estava escondido, al qual sacaron de alli e levaronlo a la batalla, segund convenia" ["The said Anfiarao hid in order not to carry out his sacerdotal duty in the battle, which was only known by his wife Erifile who, convinced by gifts of gold, revealed the place where Anfiarao was hiding, from where he was taken to the battle, as was necessary"]; Juan de Mena, Commentary on *Coronación*, (stanza viii). True Ciceronianism comes only with Luis de Granada in the sixteenth century.

One may also chart a growing use of Latin rhetoric. Although certain figures are always an option in Old Spanish, the repertoire expands as the Middle Ages wear on; the doublets of the early prosaists (often identified as an oral feature or a Semiticism) and *trias* of Baena's *Prologus* give way to classical *conduplicatio*. The style of the Old Spanish corpus can be highly mannered. Although prose was defined by its freedom from metrical rules, there is a minority current of metrical/numerical art prose. In such cases the passages or texts either take their style from their immediate source (as with certain passages in Alfonso or Juan Manuel, *Conde Lucanor*, II, 6) or belong to a readily identifiable tradition (as with the *Soliloquios* of Fernández Pecha, modeled on the supposititious works of St.

Augustine), or Juan Manuel's text on the Passion in *Libro de los estados*, I, 1vii).

It was difficult to accommodate the cadences of the Latin *cursus* (used in the liturgy and in chancery documents) to Spanish, partly because the *cursus* did not permit a stressed syllable at the end of the phrase, and valued the elegant proparoxytones common in Latin and Italian but rare in Castilian. The distinctive cadences of Villena rarely correspond to the *cursus* proper; they are generally the product of imitating "dovetailing" classical hyperbaton.

Translation afforded opportunities for imitating various Latin styles, such as the sample of Roman forensic rhetoric in Brunetto Latini's *Tesoretto* (III, xxxv). The higher of the two styles adopted by Martínez de Toledo in the *Corbacho* derives directly from his source, Andreas Capellanus.

DINIS, KING OF PORTUGAL

King Dinis, son of King Afonso III and Queen Beatriz of Castile, was born 9 October 1261 and died on 7 January 1325. The sixth king of Portugal, he ascended the throne on 16 February 1279.

During the long reign of Dinis, Portugal reached in many respects its high-water mark in the Middle Ages. The monarch's actions generated significant internal growth within his kingdom and also did much to ensure the viability of Portugal as an independent entity in the Iberian Peninsula. With the Muslim threat largely neutralized, Dinis was free to turn his attention to Portugal's boundaries with Castile. Towns, castles, and strongholds in three areas were of particular concern: (1) those on the east bank of the Guadiana River, (2) those of the Ribacoa district in the region of Boira Baixa, and (3) those near the Castilian border which were under the control of Dinis's younger brother Afonso.

Through shrewd alliances and the judicious use of military force, Dinis took advantage of the dynastic problems in Castile following the death of Sancho IV

in 1295. The Portuguese monarch first gained undisputed authority over the towns of Moura, Serpa, and Mourão. Then, in the Treaty of Alcañices (1297), which definitively fixed Portugal's borders with Castile, Portugal gained the towns and fortresses it desired in the Ribacoa district. The treaty was sealed by marriage alliances between Fernando IV of Castile and Constança, Dinis' daughter, and between Fernando's sister Beatriz and Dinis' heir, the future Afonso IV.

Dinis also resolved the problems inherent in his younger brother's control of a number of towns on the Castilian border, which Prince Afonso used as staging points to intervene in Castilian affairs. Dinis was determined to bring Afonso's towns under royal authority and surrounded his brother's fortresses. In 1299 an accord was reached in which Afonso received privileges over Sintra, Ourém, and other places closer to Lisbon in exchange for his rights over the towns near Castile's borders. This action not only helped secure Dinis' borders, but also removed an irritant to Portugal's relations with Castile.

To further strengthen his kingdom's borders, Dinis undertook a large-scale program of renovation and repair, constructing forty-four new strongholds and castles and repairing many old ones. Also, because many of the border towns were underpopulated, Dinis promoted resettlement. The Ribacoa district and the east bank of the Guadiana River received the greatest attention. But the region north of the Duero River was not neglected. Walls were built to strengthen Guimarães and Braga, as well as several smaller towns. In addition, Dinis had a wall constructed along the banks of the Tagus River to protect Lisbon from attacks by sea.

Related to these activities were Dinis' efforts to separate from Castilian influence and authority the four clerico-military orders active in Portugal: the Templars, the Hospitalers, Santiago, and Avis. The first two were international orders with headquarters in the Holy Land and branches throughout Europe; the latter two had their origins in the Iberian Peninsula. All four had played important roles in driving out the Muslims, holding the frontiers, and reclaiming the newly won lands. For these activities, the orders had been given extensive spiritual and temporal privileges.

Portugal's conflicts with Castile, especially during the reigns of Sancho IV (1284–1295) and his son Fernando IV (1295–1312), convinced Dinis that his kingdom's security was threatened by the fact that the clericomilitary orders in Portugal were under the jurisdiction of non-Portuguese leaders. Castilian interference in the political and military life of the monk-knights living in Portugal was an ever-present danger, especially in the Order of Santiago. During the Portu-

guese Reconquest much land and many strongholds had been given to the order. As boundary disputes became more intense during the reign of Sancho IV, Dinis sought to obtain from the papacy a measure of independence for the order. But it was a long, drawn out struggle. However, by the time of Dinis' death, the Portuguese Order of Santiago was for all practical purposes under Portuguese control.

In the meantime the Templars had fallen on hard times. The loss of the Holy Land in 1291 was one of two main factors that led to the demise of the order. The other was the ultimately successful personal campaign of Philip IV the Fair of France and his advisers to destroy the order and gain control of its valuable and extensive holdings. In 1312 Pope Clement V suppressed the Templars and shortly afterward ordered their holdings to be distributed to their archrivals, the Knights Hospitalers. Dinis of Portugal, like a number of the other European monarchs, had sequestered all the Templar properties in his kingdom and put its knights under his protection. The Portuguese monarch's agents at the papal court argued that the annexation of the Templars' properties in Portugal by the Knights Hospitalers would be prejudicial to the Portuguese crown and the Portuguese people. As an alternative, they proposed the foundation of a new order of monk-knights that would incorporate the property of the Templars and, with headquarters in the Algarve, would protect the Portuguese frontier from the Muslims. Clement V's successor, John XXII, agreed with this proposal and on 14 March 1319 by the bull *Ad ea ex quibus* established the Military Order of Our Lord Jesus Christ, which would eventually, by the second half of the sixteenth century, become the premier order in Portugal.

During the reign of Dinis the economic foundations of Portugal were greatly strengthened. So energetic were the monarch's agricultural reforms that he was given the epithet "O Lavrador" (the farmer). Dinis cut back on large landholdings by the church and the higher nobility. He improved landholding patterns on a regional basis and affirmed the nobility of farming one's own land. He promoted the reclamation of marshes and swamps and ordered the planting of pine forests near Leiria to prevent the encroachment of coastal sand and salt as well as to provide needed timber. Dinis's agricultural reforms ranged from the division of uncultivated lands into groups of ten, twenty, or thirty *casais* with lifetime leases in Entre Douro e Minho; to cooperatives in Trás-os-Montes; to an emphasis on repopulating the Alentejo by founding towns, hampering the wealthy from unproductively monopolizing large tracts of property, and granting land to those who would cultivate it. In this way, Dinis

increased the number of small proprietors and rural workers who paid rent to the crown. During the thirteenth century, Portugal's population probably numbered between 800,000 and 1,000,000 inhabitants.

Dinis also took note of Portugal's foreign trade. He encouraged the export of agricultural produce, salt, and salted fish to Flanders, England, and France in exchange for textiles and metals. He increased Portugal's foreign contacts as well and encouraged maritime development in the Algarve. In 1293 he supported the creation of a *bolsa de comércio* (commercial fund) by Portuguese merchants for their legal defense in foreign ports. The monarch promoted trade fairs and gave the towns that held them privileges and exemptions. Dinis also reformed the kingdom's coinage. Further, he promoted the mining industry by encouraging the extraction of silver, tin, sulphur, and iron.

Although Portuguese shipping had played a role in the kingdom's defense, as well as in the offensive against the Muslims, it was not until the reign of Dinis that a Portuguese navy was officially established. In 1317 the Portuguese monarch signed a contract with the Genoese Manuele Pessagno (Manuel Peçanha) that made him and his heirs admirals of Portugal and gave him many important rights and privileges. Pessagno was to provide twenty Genoese captains and build up the king's fleet. He was obliged to defend Portugal's coast, but at the same time was free to engage in commerce between his native Italy and England and Flanders.

Dinis ordered the exclusive use of Portuguese as the nation's language. Works of history and law were translated into Portuguese, including the *Siete Partidas* of Dinis's grandfather, Alfonso X of Castile and León. In 1290 papal approval was received for the University of Lisbon, which Dinis had founded several years earlier. In 1308 the university was transferred to Coimbra, where it remained until 1338. Between 1354 and 1377 it was again at Coimbra; then it returned to Lisbon and remained there until 1537.

By promoting royal justice and cracking down on the usurpation of royal prerogatives, Dinis also greatly increased royal authority. He reinstituted the *inquiriçōes* (general inquiries) of his predecessors, especially in the regions of Beira Baixa and Entre Douro e Minho. Further, he gradually resolved the kingdom's problems with the papacy, ending the twenty-two years struggle with Rome that had left his father and him excommunicates and Portugal under interdict. In 1289 a compromise, the Concordat of the Forty Articles, was signed. Although the church did not give up any of its ideas regarding the immunity of its holdings and its jurisdiction, it did agree to obey royal authority.

An important figure in Portugal during Dinis's reign was his wife, Isabel—the future St. Isabel—whom he married in 1288. The daughter of Pedro III of Aragón, the Portuguese queen played an important role as a mediator in the feuds between her husband and his brother Afonso, and between the king and his son, the future Afonso IV. In addition, her skill as a conciliator was of major significance in the negotiations leading to the Treaty of Alcañices, which fixed the definitive boundaries between Portugal and Castile.

DISPUTATIONS, RELIGIOUS

While there certainly were “debates” and disputes among Christians, and within and between various religious orders, when reference is made to religious disputations, it is preeminently to those between Jews and Christians. This is a topic with a history going back perhaps to the very early years of Christianity (although most scholars agree that the “disputation” in Justin Martyr, for example, is a literary fiction). Certainly in the fourth century Pope Sylvester I was involved in a disputation with a Jew that later was turned into a legend centered on the alleged conversion of Emperor Constantine. Real disputations were frequent in the Byzantine Empire, but we know of none in Visigothic Spain, which is all the more surprising, given the intensity of anti-Jewish polemic and legislation.

The upsurge of missionary zeal among the Dominicans and Franciscans in the thirteenth century, partly as a result of the Christian heresies that dominated Provence and parts of Spain, resulted in a new militancy with regard to Jews, and also Muslims, that had not been typical of church attitudes in prior centuries.

The most famous medieval disputation early in the thirteenth century was that at Paris (1239) between a Jewish convert to Christianity, Nicolas Donin, and rabbis such as Yehiel Ben Joseph of Paris, Moses ben Jacob of Coucy, and others. Another converted Jew, Pablo Christiani, who was preaching in France and Provence at that time, stirred up further animosity toward Jews.

This resulted in the first known disputation in Spain, the Barcelona Disputation. Actually, there were two of these. The first was between Pablo Christiani and Bonastrug de Porta, a well-known Jewish lay leader of Girona (whose son, Vidal, was condemned

to death by the Jewish community as an informant). It also involved the bishop of Barcelona, Berengario (Berenguer de Palol), and others. Inasmuch as Berengario died in 1242 (not 1241, as sometimes claimed), this first disputation could not have taken place later than 1241, the date associated with other Christians who participated in it. Bonastrug wrote an account of his views, obviously in Catalan, which he gave to the bishop of Girona. This work was subsequently condemned for blasphemy, and Bonastrug was exiled from the kingdom of Aragón-Catalonia for two years.

The second, more famous, Barcelona disputation again involved Pablo Christiani, this time with Moses ben Nahman (Nahmanides), who was not a rabbi but an important Jewish leader of Girona, and adviser to King Jaime I, in Barcelona. The disputation took place before the king, and again involved many prominent church leaders, the most important of whom was the notoriously anti-Jewish Ramón de Peñafort, head of the Dominicans and author of the *Decretals* and most of the *Siete Partidas*. Clearly he was the moving force behind this disputation. The debate centered mostly on the question of the Messiah in Jewish sources, and whether Jesus was or was not the expected Messiah. Obviously the Christians “won” the debate. There was no sermon in the synagogue by Jaime I, as Baer incorrectly states. Nahmanides, whom Baer and everyone following him has confused with Bonastrug de Porta, was not “banished” but apparently decided it would be prudent to leave Spain. He settled in Palestine, where he died. There is an official Latin record of the disputation and a Hebrew version that purports to be (but is not) the work of Nahmanides.

The result of the second Barcelona disputation was a disastrous investigation into the charges of anti-Christian polemic in one book of Maimonides' *Code of Jewish Law* (true; not “all” of Maimonides' books were ordered burned, nor were “any” Jews, contrary to the claims of some writers). A commission, composed of Peñafort and others, including Ramón Martí, later the author of an infamous anti-Jewish polemic, was set up to investigate all the books owned by Jews for evidence of blasphemy. However, the Jews convinced the king of the absurdity of this, and the order was rescinded.

Nevertheless, this investigation began a campaign of sermons, often compulsory (that is, Jews were forced to attend), preached by Dominican and Franciscan friars throughout Spain, especially in the kingdom of Aragón-Catalonia, from the thirteenth through the fifteenth centuries. Not all the monks were “anti-Semitic,” and some, such as Ramón Llull, showed a remarkable spirit of tolerance and even understanding. The damage was done, however, and relations between

Jews and Christians in Spain were to some degree changed forever.

Some minor disputations continued. Jaime II, for example, ordered the Jews to permit and respond to disputations with Dominican preachers throughout the realm. In 1286 there was yet another disputation, this time in Mallorca, of less importance than those of Barcelona. In 1379 there was one involving Pedro de Luna, the cardinal who was to become Pope Benedict XIII.

When he became pope, Benedict at once demonstrated his strong hostility to Jews, which was to be manifested in many ways (his unsuccessful attempt to impose the wearing of the "badge" yet again, to condemn the study of the Talmud, etc.). In this he had the enthusiastic support of Vicente Ferrer, the dynamic Dominican preacher whose personal insistence had already convinced Queen Catalina of Castile and Fernando de Antequera, regents of the kingdom, to enact the anti-Jewish Ordinances of Valladolid (1412). Fernando then became king of Aragón, where the influence of Ferrer, as personal confessor of the king, led to more anti-Jewish measures during his short reign.

The recent conversion of important Jewish figures, such as Solomon ha-Levy (the rabbi of Burgos, also known as Pablo de Santa María), and Joshua aha-Lorqi (Jerónimo de Santa Fe), no doubt encouraged the pope in his plans to convene a major disputation at Tortosa in 1413. Letters were sent to all the Jewish communities of the kingdom of Aragón-Catalonia, ordering them to send representatives. Jerónimo took the leading role in presenting the Christian side of the debates, which again focused chiefly on messianic beliefs of the Jews. The debate dragged on for several days in February, was reconvened in the spring of 1413 and lasted at least to the end of August, and was resumed again in the fall, lasting until April 1414. This longest disputation in history involved the foremost Jewish scholars, rabbis, and lay leaders of the kingdom. Among these were famous scholars such as Zerahyah ha-Levy (Ferrer Saladin), Mattityahu ha-Yishari, and Joseph Albo. One of the important lay representatives was a Hebrew poet, Vidal Joseph ibn Labi (not de la Cavallería, as Baer incorrectly identified him), who converted to Christianity. His former teacher in poetry, the famous poet Solomon de Piera, did *not* "join him in going over to Christianity" (Baer), then or at any other time, but remained a loyal Jew and an official of the Zaragoza Jewish community. However, several other rabbis and prominent Jewish leaders did convert as a result of the disputation.

The devastating effects of these conversions, coupled with earlier ones of such important Jews as Solomon ha-Levy and his entire family, and Joshua al-

Lorqi, both of whom now began writing anti-Jewish polemics, created a sense of despair throughout the Jewish communities of Spain. Vicente Ferrer thus found fertile ground for his missionary sermons, and entire Jewish communities converted.

The official Jewish response to the Tortosa disputation was weak and ineffective. Mattityahu ha-Yishari wrote a small and not very profound work that had limited readership. Joseph Albo composed a huge tome on the "principles" of the Jewish faith, but the arguments were weak and the work had little or no lasting effect upon the Jewish communities.

There were no more disputations between Jews and Christians in Spain, at least that we know about. This was undoubtedly due to the overwhelming success of the Tortosa disputation and, especially, of the preaching of Ferrer in converting thousands of Jews, and to the fact that there were no more rabbis or Jewish spokesmen capable of defending the Jewish position in Spain until the very end of the century. Thus, with some isolated exceptions, the Dominican and Franciscan campaigns among Jews diminished, and soon ceased altogether.

DIPUTACIS DEL GENERAL DE CATALUNYA, See GENERALITAT

DISTICHA CATONIS

A collection of Latin proverbs, arranged in couplets, the *Disticha Catonis* was widely used as a school text in the Middle Ages, serving as both a handbook of moral education and a first Latin reader. The sayings provide bits of commonsense wisdom, such as the need to avoid excess and not to fear death, in addition to more mundane advice, such as to chew with one's mouth closed and not to be deceived by dishonest merchants. It was presumably the work's didactic value that motivated its translation into Castilian for the benefit of non-Latinists. The earliest translation is an anonymous *cuaderna vía* (monorhymed quatrain version) probably of the late thirteenth or early fourteenth centuries, but known only in sixteenth- and seventeenth-century imprints. There is also an eleven-stanza cuad-

erna vía gloss of a single distich that highlights the problem of free will. It is possibly part of a more extensive glossed version, and most likely dates from the late thirteenth or early fourteenth centuries. Later, other glossed translations were printed in Castilian verse: Martín Garðia Puyazuelo's *La traslación del muy excellente doctor Chatón* (completed in 1467; printed ca. 1490) and Gonzalo García de Santa María's *El Catón en latín y en romance* (printed 1493/1494).

DIVORCE See MARRIAGE AND DIVORCE

DOMINGO DE SILOS, ST.

Domingo Manso was born in 1000 in the Riojan village of Cañas (Logroño). From a very early age he was educated in the Scriptures, and he was ordained a priest before the age of twenty-five, then continued to live at his parents' house for a year and a half. Around 1027 he abandoned his home to become a hermit. After remaining in the wilderness for a year and a half, he decided to submit to the rule of obedience and traveled to the monastery of San Millán de la Cogolla. He lived there from 1030 to 1040 and was appointed *praepositus*. In 1040, as a consequence of friction with King García III Sánchez of Navarré, Domingo was forced to leave San Millán and move to Castile. There, in 1041, Fernando I appointed him abbot of the monastery of San Sebastián de Silos (in decay and ravaged by al-Manṣūr's raids) and charged him with its restoration. Domingo reestablished monastic discipline, started the building of the romanesque cloister, and encouraged the work of scribes. In 1062 he was at the translation of the relics of the martyrs Vincent, Sabina, and Cristeta to the monastery of San Pedro de Arlanza in Burgos. He was also present, in 1063, at the translation of the relics of St. Isidore of Seville to the city of León.

Domingo was a distinguished figure at the Castilian court, and kings Fernando I, Sancho II, and Alfonso VI made important donations to the monastery. Domingo died on 20 December 1073. In 1076 the fame of his holiness caused the bishop of Burgos to order the translation of his body to an altar in the abbey

church whose original name was replaced by that of the saint who had restored it. During his life he exorcised the possessed, healed many lame people, and liberated captives. The latter activity caused him to be called "Redeemer of the Captives."

DOMINICAN ORDER, OR ORDER OF PREACHERS

The Order of the Friars Preachers is the principal part of the Dominican Order. The order also includes two other parts: the Dominican Sisters (Second Order) and the Brothers of Penitence of St. Dominic (Third Order).

The thirteenth century is the classic age of the order, witness to its broad development and intense activity, especially in teaching and in the suppression of heresy. Through its preaching by word and book, it reached all classes of society, combated heterodoxy, schism, and paganism. The order's schools spread throughout the church and its doctors wrote monumental works in all branches of knowledge. Two of its most distinguished intellectuals were Albertus Magnus and Thomas Aquinas.

When Domingo de Guzmán (St. Dominic) asked the Vatican for official recognition of his order in 1216, the first preachers of his band of companions numbered only sixteen, seven of whom were of Iberian origin, including Domingo's brother Manés de Guzmán. Three of the Iberians, along with four others, were sent to Paris in 1217 to found a convent close to the university there. Miguel de Fabra, who was a member of the group, was the first Dominican to hold a chair at the University of Paris. Fabra later founded houses in Cataluña and Aragón and became the confessor of Jaime I of Aragón, accompanying the king on his conquests of Valencia and Mallorca. Fabra also organized the order's schools in Barcelona. The other four of Domingo's initial seven Hispanic companions were sent to Iberia to found convents in Madrid and Segovia. In 1218 Domingo came to Segovia in order to ensure the foundation of the convent there. During his visit to the peninsula, Domingo was instrumental in founding houses at Palencia, Burgos, Zamora, Zaragoza, Barcelona, and Santiago de Compostela. In 1219,

his brother Manés was sent from Paris to Madrid to direct the convent of nuns recently established there.

By the time of the first general chapter in Bologna (1220), the order counted some sixty establishments, and was divided into eight provinces: the Spains (i.e., all the Iberian kingdoms), Provence, France, Lombardy, Rome, Teutonia, England, and Hungary. Aragón became a separate province in 1301. Each of the provinces was headed by a provincial under whom the conventual friars served. The order was headed by a master general who directed the provinces.

The spread of the order in the Iberian Peninsula was rapid. The first prior provincial of the Spains was Suero Gomes, a Portuguese who figured among Domingo's first group of companions. The first meeting of the chapters of the province (Toledo 1250) records twenty convents (Segovia, Palencia, Burgos, Zamora, Toledo, Salamanca, León, Pamplona, Santander, Lisbon, Coimbra, Porto, Santiago de Compostela, Zaragoza, Lérida, Valencia, Mallorca, Barcelona, Córdoba, and Seville). During that first meeting six conventual visitors were named to collaborate with the prior provincial to help oversee the work of the order in Iberia.

Several centers stand out in the thirteenth century, most notably Barcelona and Salamanca. The convent of San Esteban in Salamanca developed close ties to the university there and became an important focus for learning in the order. Barcelona saw the development of a center for specifically Dominican studies. The schools at Lisbon and Játiva are also important—especially the latter, which excelled in the teaching of Arabic and Hebrew for the purpose of evangelization. In 1225, the first Spanish Dominicans evangelized Morocco. Some years later they were already established at Tunis. In 1256 and the ensuing years Pope Alexander IV, at the instance of Raimundo of Peñafort, gave a strong impulse to this mission. Notable works by peninsular Dominicans of the thirteenth century include Raimundo of Peñafort's *Summa Poenitentialis* and Raimon Martí's *Pugio Fidei*. Raimundo also composed the first directory of inquisitorial law for trials of heresy and served as one of two Iberian master generals of the order during this time (1238–1240); the other was Munio of Zamora (1285–1291). Three fourteenth-century Iberian Dominicans were canonized: Domingo, the founder of the order, Raimundo of Peñafort, and Telmo. Manés de Guzmán was beatified.

Domingo did not write a rule for the Tertiaries. However, a large body of the laity, vowed to piety, grouped themselves around the rising Order of Preachers and constituted a third order. Munio de Zamora in 1285 wrote the rule for the Brothers and Sisters of Penitence of St. Dominic. The privilege for their constitution was granted on 28 January 1286 by Pope Hon-

orius IV, thus giving the group a canonical existence. Munio's rule was not entirely original; some points were borrowed from the Rule of the Brothers of Penitence, whose origin dates back to St. Francis of Assisi. The Dominican Tertiaries were local and without any bond of union other than that of the preaching friars who governed them. After professing, however, they could not return to the world but could enter other religious orders.

During the first part of the fourteenth century the order came under royal patronage in Iberia and saw vigorous growth in personnel, houses, and influence. The plague years, however, witnessed a rapid decline in the order, which was obliged to relax standards for admission to the novitiate so as to fill the many vacancies created by disease and death. A reform of the order was initiated in Lombardy by both the master general, Raymond of Capua, and Catherine of Siena but did not reach Iberia until 1423, when it was begun at the instance of Alvaro de Córdoba. The Iberian reform was finished in 1504 under the direction of Diego Magdaleno.

Nicolau Eymerich, author of the *Tractatus de potestate papae* written in defense of the papacy at Avignon, stands out as the most distinguished Iberian Dominican of the fourteenth century. Vicente Ferrer, achieved great notoriety through his preaching and became influential in politics in both Castile and Aragón, intervening in, among other things, the Compromise of Caspe (1411). Shortly after his death in 1412 Ferrer was canonized.

Alvaro de Córdoba, who had been confessor to Queen Catalina de Lancaster, in 1423 retired from the court to the convent of Santo Domingo de Scalaceli in Córdoba. From there he initiated the Iberian reform of the order begun in Lombardy at the end of the previous century. The reform was greatly aided by the efforts of Cardinal Juan de Torquemada who, with the aid of Fray Alonso de San Cebrián, arranged independence for the reform congregation of the order in the Iberian provinces. Torquemada was an eminent churchman and jurist who wrote extensive works on the *Decretals* of Gratian that were very influential in defense of pontifical rights.

The order's work in the suppression of heresy, in which it had been especially active, had diminished notably in the second half of the thirteenth century. The perception of the rise of heresy in and around Seville in the 1470s brought about the reestablishment of the Inquisition in Iberia with new duties for the inquisitor general. These were exercised from 1483 to 1498 by Tomás de Torquemada, nephew of Cardinal Juan de Torquemada, who reorganized the scheme of suppression. Tomás de Torquemada's efforts were fol-

lowed by those of by Diego de Deza from 1498 to 1507. They were the first and last Dominican inquisitors general in Spain.

During the late fifteenth and early sixteenth centuries, the Dominicans established large colleges of higher education in the kingdom of Castile. Among the most famous of these were the Colegio de San Gregorio at Valladolid, founded in 1488 by Alonso de Burgos, and that of Santo Tomás at Seville, established in 1515 by Diego de Deza, who was then archbishop of that city.

DRAMA

The rise of the theater in medieval Europe is connected with the Easter liturgy in the Catholic Church. Near the end of the tenth century the *Quem quaeritis*, one of the ceremonies that had developed as part of the celebration of Holy Week, became the focal point of liturgical drama. It depicted the dialogue between the angel and the three Marys at the sepulcher after the Resurrection, beginning with the words, “*Quem quaeritis in sepulchro, o Christicolae?*” (Whom do you seek in the sepulcher, o followers of Christ?). The addition to the *Quem quaeritis* of other scenes related to the Resurrection, such as the race of the Apostles Peter and John to the empty sepulcher and the three Marys purchasing ointments from the spice merchant, culminated in the *Visitatio sepulchri*, the oldest known complete liturgical play.

Though the earliest documented example of the *Quem quaeritis* dialogue in Spain is found in an eleventh-century breviary from Silos, the practice of presenting liturgical drama did not prosper in this region. The area to the east, however, displayed a vigorous and flourishing tradition. The Benedictine abbey of Ripoll in the province of Girona became a center of diffusion and innovation, and influenced the development of liturgical drama in both Spain and France. In addition to several examples of the *Quem quaeritis*

dialogue, a fully developed twelfth-century *Visitatio sepulchri* is found in Ripoll. Although the manuscript does not contain representational rubrics, the dialogue is divided into two scenes requiring different staging locations, and for an early liturgical play it exhibits a highly developed sense of stage action. A singular aspect is that it contains the earliest recorded version in Europe of the spice merchant scene.

The Christmas season generated its own type of plays: the *Ordo prophetarum*, presented on Christmas Day, and the *Ordo stellae*, on Epiphany. The *Ordo prophetarum* derived from a sermon incorrectly attributed to St. Augustine. A long list of prophets from the Old Testament and several pagan ones, among them the sibyl, foretold the coming of Christ. The earliest recorded reference to the sibylline chant in Spain is found in a tenth-century manuscript from Ripoll. In Toledo the Erythraean Sibyl (there were several sibyls; the different names usually indicate the place of origin) appeared in the fourteenth century, and by the fifteenth she was chanting in Castilian and was dressed in oriental costume.

Toledo also claims one of the earliest dramatic texts in a romance vernacular, the *Auto de los reyes magos*. Composed in the twelfth century, it was discovered in 1789 by Felipe Fernández de Vallejo in a chapter library of the Toledo cathedral and was published in a modern edition by Ramón Menéndez Pidal in 1900. Unlike the *Ordo stellae*, the *Auto* seeks to delineate characterization in order to enhance dramatic conflict, and although the text lacks stage directions, it suggests dramatic movement. Versification is adjusted to the situation, and the action, developed in five scenes, is placed within designated spaces requiring separate locales.

Though Easter and Christmas gave rise to the earliest recorded forms of liturgical drama and to a large number of cyclical performances, the feast of Corpus Christi (then celebrated on the second Thursday after Pentecost) and the feast of the Assumption (celebrated on August 15) were the principal dates for religious performances in later centuries.

Unlike the Easter and Christmas cycles, which were normally performed indoors, the celebration of Corpus Christi took place during an open-air procession or pageant. It is not certain when plays were first acted in conjunction with this pageant, although references to the procession precede the first documented performances of plays by at least a hundred years. The feast of Corpus Christi was celebrated in Girona as early as 1360, and in Barcelona and Valencia by the end of the fourteenth century. In Valencia the procession had a spectacular splendor. The Host was carried through the streets accompanied by a large number of

angels, virgins, prophets, saints, and other figures. The tableaux on floats or pageant carts, known as *roques*, represented episodes from the lives of saints, allegorical figures, or situations such as the creation of the world, Eden, Hell, and the salvation of the soul. This is in great contrast to the Easter and Christmas cycles, which dealt exclusively with events in the life of Christ. The city of Seville rivaled Valencia in the magnificence of its Corpus Christi festivities, but there is no evidence in either city of dialogue being used in an actual dramatic presentation until the sixteenth century. Textual evidence for the earlier period is found, however, in Toledo, where the account books detailing the expenses for the Corpus Christi procession for the years 1493–1510 include more than thirty titles of *autos* commissioned for performance in connection with the pageant. One of the pages contains a fragment of an *Auto de la Pasión* by Alfonso del Campo, written in the late fifteenth century.

The best-known Assumption play is the *Miste* or *Festa de Elche*, which has been performed more or less continuously since the fifteenth century. Today, as in earlier times, the *Miste* at Elche is normally acted by children and three priests. The latter impersonate St. Peter, the Father in the Holy Trinity, and the angel who carries the soul of the Virgin in the *araceli* (from the Latin *ara coeli*, heavenly altar); it refers to the platform that descends from the dome of the church over the transept. The play is presented in two acts on the afternoons of August 14 and 15; “La vespra,” on the day preceding the celebration of the feast, and “La festa,” on the feast day itself. In the first act the Virgin visits the Stations of the Cross placed along the columns of the nave as she proceeds slowly to the *cadaf* (platform) that has been erected in the transept. She climbs the *cadaf* and lies on the *llit* (her deathbed), surrounded by the apostles. The angel, carrying an image of the Virgin symbolizing her soul, ascends to heaven on the *araceli*, which is lifted to the dome. In the second act the angel returns from heaven and places the image of the Virgin on the body lying on the *llit*. Her body and soul having been reunited after death, the Virgin ascends triumphantly to heaven with the acclamation of the angels, the apostles, and the spectators.

Secular performances also were very important in the development of drama. Nonreligious festival performances and court spectacles reached considerable elaboration in the use of stage machinery and gave rise to new forms of drama. The term drama appeared as early as the fourteenth century and referred to the brief entertainment performed during a ceremonial banquet. The *momería* (mummery) represented one of the earliest forms of the court masque in Castile (early fifteenth

century) where symbolic drama and lyric entertainment were joined. Gómez Manrique composed *momerías* for the young Princess Isabel of Castile. The secularization of drama was also evident in the pastoral plays and dialogues of political satire composed for court entertainment. The anonymous *Coplas de Mingo Revulgo* and Rodrigo de Cota’s *Diálogo entre el Amor y un viejo* contain dramatic elements in dialogue form. In 1495 Francisco de Madrid composed an *égloga* in the form of a dramatic panegyric, and a year later in Salamanca, Juan del Encina published eight dramatic eclogues that mark the beginning of Renaissance drama in Spain.

DUARTE, KING OF PORTUGAL

The son of João I and Philippa of Lancaster, Duarte was born at Viseu in 1391. He reigned from 1433 to 1438, but he had been in charge of the affairs of the state since 1431, when his aging father had delegated his powers to him. Duarte married Leonor of Aragón on 22 September 1428, and had ten children by her. He collaborated closely with his brothers, Henrique the Navigator and Pedro, Duke of Coimbra, in shaping the policy of the new Portugal that led to maritime expansion. At home he centralized political power by promulgating the *Le mental* (mental law) at the *corte* (Parliament) of Santarém (1434), so named because his father had it in mind. This law was designed to preserve and recover from previous donations the property of the crown. Duarte fully supported the voyages of exploration along the western coast of Africa to which Henrique was deeply committed. During his reign the dreaded Cape Bojador was rounded (1434) and one hundred leagues of coast were explored. He pursued the policy of conquering Morocco, which had begun in 1415, by attacking Tangier (1437). The expedition was a disaster and justified the reservations he

had shared with Pedro and others about the effectiveness of this policy, strongly supported by Henrique. Duarte was also a writer and an intellectual. He produced the *Leal conselheiro* (1438), a compilation of his essays on human passions, morals, and society. He showed remarkable powers of self-analysis when he described the effects of melancholy and *saudade* (nostalgia), considered to be the expression of a national feeling. He has left a work on the art of riding (ca. 1433), the most complete on the techniques of jousting in the fifteenth century.

DUERO RIVER

From its source in Soria province, Spain, the Duero (Douro in Portuguese) flows for over 913 kilometers, then empties into the Atlantic Ocean near Oporto, Portugal. Its main tributaries from the east are the Pisuerga, Valderaduey, and Esla in Spain, and the Sabor, Tua, and Tamega in Portugal. Its tributaries from the west are the Eresma, and the Adaja. The Duero is the most important collector of the northern *meseta* (plateau), on which, after crossing rugged land, it runs over flat hills and fields down to the border with Portugal, where it narrows and flows through the penepain (Arribes), then becomes navigable from Fregeneda (Salamanca) to the sea.

The barbarians seized the Duero basin, which was crossed by Roman roads, and divided it into four provinces. The Visigoths expanded into the northern and southern parts of the Duero basin, and their presence is witnessed in some medieval place names, such as Campos de los Godos (Gothic Fields) in Tierra de Campos, and in many campaigns against Cantabrians and Basques trying to advance toward the south. Arabs also followed the Roman roads in their advance to the north.

The reconquest of the Duero basin involved both the building of military strongholds and repopulation. Alfonso III of Asturias initiated the advance to León and then Oporto in 868, repopulating the lands between the Miño and Duero Rivers. In the east Castilian counts

advanced as far as the Arlanza River and reached the Duero in 912 (Roa, San Estéban de Gormaz). However, to settle the Duero's northern lands it was necessary to introduce the *presura* system, which allowed the Galicians, Asturians, Cantabrians, Basques, and Mozarabic peoples coming from the south to claim land. Estate possession was determined by the monarchy or through a count, bishop, or abbot.

In the early-tenth century along the Duero, a line of fortifications—Soria, Almazán, San Esteban de Gormaz, Burgo de Osma, Aranda, Roa, Peñafiel, Tordesillas, Toro, and Zamora—protected the northern lands. 'Abd al-Raḥmān III attacked the central Duero strongholds, and was defeated at Simancas in 934 (although his troops destroyed Roa). The victory allowed the Christians to cross the Duero and reach the Tormes River, and they resettled Salamanca and Sepúlveda. The occupation of the land between the Duero and the central mountains—Castile-León-Estremadura—was fortified, and privileges were given to the cities of Salamanca, Avila, Segovia, and Sepúlveda. Al-Manṣūr attacked some cities of Castile-León and plundered Salamanca, Zamora, and Simancas, ending their tribute to Ramiro II. The many disputes among the Christian and Muslim kingdoms lessened the importance of the western Duero, and the making of the border at the central mountains was postponed until Fernando I of Castile and León advanced as far west as the Mondego River, regained the Duero valley strongholds, and subdued Toledo's *tā'ifa*. The city of Toledo was conquered by Alfonso VI in 1085, and the Christian-Muslim frontier was moved toward the Tagus River.

The political unification of the Duero basin depended on the distribution of patrimonies, which raised enmities between León and Castile. After Fernando I's death in 1065, Castile, León, Toro, and Zamora were divided, but were reunited by Alfonso VI, who gave Trás-os-Montes and Beira to his daughter Teresa. All of this area became Portuguese when his grandson was proclaimed king by King Alfonso VII in the Treaty of Zamora (1143). In the middle Duero, Tierra de Campos was incorporated by Fernando III. Therefore the Duero lost interest as a border. Its major cities became famous because of the Meseta's cattle trails, court celebrations in Toro and Zamora, the cities, privileges, and the magnificent buildings erected by the king and nobles in Tordesillas, Peñafiel, Almazán, and Berlanga.

E

EBRO RIVER

The Ebro is the second longest Spanish river. First named the Iberus, for the Iberian Peninsula, it rises in the Cantabrian Mountains, where it is named Híjar. The river flows through gorges and flat hills down to La Rioja, where it forms a basin bounded on the north by the Pyrenees and on the south by the Iberian Mountains. The Ebro passes through a varied landscape of hills, flat expanses of arable land, and fertile lowland down to Mequinenza, carving gorges and canyons. Further on, the Ebro reaches Tortosa and flows into the Mediterranean. Its tributaries come from the Pyrenees: the Aragón, Gallego, Cinca, Noguera, and Segre Rivers. On the west the Jalón connects with the *Meseta* (plateau), and the Jiloca with Teruel province.

The Ebro valley, a major natural communications axis, connects the Cantabrian region with the Mediterranean coast and with Europe to the north through its Pyrenees tributaries. In the Middle Ages it was occupied by Muslims, Hispano-Visigoths, and Carolingians. The Ebro Valley was crossed by Roman roads, and boasted such important and prosperous cities as Zaragoza, Huesca, Tarragona, and Borja, which flourished until the fifth-century barbarian invasions. During the Visigothic period Euric (r. 466–484) seized Pamplona and Zaragoza, and in 631 the Franks arrived.

The Muslims invaded the Ebro valley and Musa seized Zaragoza in 714; Fraga and Monzón then capitulated. The Muslims' dominion was not onerous because they allowed the Christians to retain their property, religion, and local authorities. Thus they could control the whole territory from a few strategic strongholds. Muslims settled steadily along the Ebro—Calahorra was seized in 796 by Al Ḥakam I—and reached as far as eastern Castile. In the center of the valley Zaragoza, became one of the most important cities of the northern Muslim kingdom. Other major cities were Tudela, Lérida, and Tortosa. Christians in the Pyrenees were in contact with those living in the northern val-

leys, and through them the Carolingian invasion was made possible. Charlemagne seized Pamplona in 778 and neared Zaragoza but failed to consolidate the Spanish March in the Ebro valley.

Due to its strategic value, the northern stretch of the Ebro was disputed by Muslims and various Christian kingdoms. In the tenth century Sancho García I of Navarre seized Nájera and Tudela, but the Muslim counterattack reached Pamplona in 924. After Calahorra's seizure in 1045 by Navarre, that kingdom's border was established. Through this kingdom new European ideas arrived (Cluniac reform, Pilgrim's Way) and flourished in cities such as Logroño and Miranda de Ebro.

The central Ebro valley, from Tudela to Mequinenza, belonged to the Banū-Qāsi, *ṭā'ifa* of Zaragoza, who built the Aljafería Palace and seized Tortosa in 1061. From the Pyrenees the Christian refugees advanced and conquered Barbastro in 1064 with Norman support; Pedro I of Aragón conquered Huesca in 1096, and the Catalanian Christians advanced through the Cinca and Noguera River valleys.

In the twelfth century Alfonso I of Aragón, supported by Franks, Catalans, and Basques, conquered Zaragoza in 1118; two years later Tarazona, Borja, and Epila fell to him. After the victory over the Almoravids at Cutanda, they seized Calatayud and Daroca. In 1133, advancing along the Cinca and Segre rivers, they conquered Fraga. Once subdued, the Muslims capitulated and were allowed to remain as serf farmers (*exaricos*). However, with the arrival of great numbers of Mozarabs from the south, tension arose in the countryside. Muslims were forced to live in special quarters outside the towns (*morerías*), while the city centers were occupied by privileged Franks.

Once the valley of the Ebro had been reconquered, quarrels arose among the Christian kingdoms. Alfonso I's will led to the incursion as far as Zaragoza by Alfonso VII in 1136, and Tortosa's seizure by Ramón Berenguer IV in 1148. Once the Christian kingdoms'

borders were established, the Ebro lost strategic value. However, its cities played important political roles (e.g., the Compromise of Caspe in 1412).

EDUCATION, CHRISTIAN

The Roman-Visigothic schools of Iberia reached the height of their development at the time of St. Isidore of Seville and appear to have disintegrated almost immediately after the Muslim Conquest of 711. There exists little information about Christian education between this time and the first reliable recorded information from the eleventh century. A few oblique references exist for the period between 711 and the time of the redaction of the *Historia Silense*, composed by a monk at Silos in the twelfth century, but these appear to be anachronisms that reflect conditions contemporary to the *Historia's* composition rather than actual circumstances. The paucity of specific documentation notwithstanding, wills, deeds, donations, and histories continued to be written between the time of the conquest and the earliest reliable information regarding the existence of a school in Christian Iberia in the eleventh century, a reference to the destruction of a *schola* at San Pedro Rocas in Galicia (set afire by its students!). This is followed by a reference from 1073 in which Bishop Pelayo of León writes that he was reared and educated in church doctrine at Santiago de Compostela. Later in the century, the first bishop of Santiago, Diego Gelmírez, speaks of reforming that same school, in which he had been a pupil. It is possible that the church councils of Coyanza (1055) and Compostela (1056) animated the development of schools, as well as the Cluniac reform in the Iberian Peninsula during the same period. Specific recommendations for Christian education aimed at all Christendom were made during the Third and Fourth Lateran councils of the Catholic Church, in 1179 and 1215, respectively.

As Christianity moved south in the peninsula during the Reconquest, numerous decrees call for the establishment of cathedral schools. After the second quarter of the twelfth century, many witnesses who sign as *magistri scholae* begin to appear in canonical legal documents and legislation. This is the case with

Salamanca (1131), Astorga (1154), Toledo (1172), Cuenca (1183), León and Segovia (1190), and Tuy (1203). By the thirteenth century similar documents had become too numerous to list.

Until the end of the twelfth century, parish schools seemed to prevail over centers of higher learning. The *Versus ad Pueros*, dated 1122, from the monastery of San Millán de la Cogolla offer the first glimpse of a curriculum, giving brief mention to Virgil and Cato. Generally, however, students in the parish schools of Iberia prior to the thirteenth century only learned certain subjects like the Pater Noster, the Psalms, the New Testament, hymns, and rudimentary Latin grammar. There were no intellectual centers in medieval Iberia comparable to St. Gall in Germany, Bobbio in Italy, or Fleury in France, prior to the foundation of the first university at Palencia, established by Alfonso VIII of Castile in 1212, followed by Salamanca in about 1218, when Alfonso IX of León officially established a *studium generale* there.

The thirteenth century saw the foundation of many schools that were not universities. Two of note are those founded by Alfonso X el Sabio at Seville for the study of Latin and Arabic (1254) and by his son, Sancho IV, at Alcalá de Henares (1293). After the thirteenth century, canonical legislation concerning the establishment of grammar schools appears to have taken effect. There is evidence of the existence of a number of grammar school masters, and by 1290 the synod of Calahorra ordered each of its archdeaconries to make provisions for two masters of grammar. The cathedral archives of Oviedo, Toledo, Santiago, Segovia, and Cuenca all contain documentation to the same effect that continues well up until the end of the fourteenth century, reflecting renewed ecclesiastical measures taken in 1322, when the council of Valladolid ordered each diocese, as well as monasteries, to establish two or three grammar schools and support masters of logic in the larger cities. At the same time, the council decreed that one of every ten clerics holding benefices should be sent to a university to study theology, canon law, or liberal arts. Clerics were sent not only to established university centers in the peninsula like Salamanca and Lérida, but abroad to places like Bologna, Montpellier, Toulouse, and Avignon. By the end of the fourteenth century, no diocese seems to have been without a school of some sort. The majority of them, however, continued to teach little more than grammar and liturgy, since the average cleric trained in them was required to possess only the bare rudiments of an education in order to celebrate mass.

EDUCATION, JEWISH

The tradition of learning among the Jews predates their coming to Spain, and goes back to the Bible itself, which commands study as a means (perhaps the ultimate means) of serving God. This tradition earned the Jews the title *ahl al-kitāb* (people of the book) among the Muslims.

The origins of Jewish education in Spain are lost in legend and myth, but clearly by the eleventh century outstanding scholars such as Judah ben Barzilai and Samuel ibn Naghrillah had established themselves, the former in Barcelona and the latter in Granada. Córdoba, Denia, and Lucena soon became other major centers of Jewish learning, the last with a yeshiva of international fame.

Scholars like Joseph ibn 'Aqnin (twelfth century) and others have left detailed programs for the education of children, beginning with Hebrew grammar and Bible, from the age of three, through the study of Midrash and Mishnah, from the age of ten. At age fifteen the study of Talmud could begin in earnest.

Along with this attention to religious studies, there was the pursuit of secular knowledge, for Jews shared with Muslims the conviction that all areas of knowledge led to the perfect apprehension of God. This meant mastery of Arabic as well as Hebrew, then of mathematics (including geometry, algebra, and more), physics and optics, poetry and music, logic and metaphysics, culminating in the study of medicine. All of this was accomplished before the age of eighteen, at the latest. Of course, in practice such an ideal was attained mostly by members of the aristocratic elite, unless a boy showed particular promise and would be supported by community funds. Jews studied these subjects, together with Muslim students, under outstanding Muslim scholars. Maimonides was one such; as a boy in al-Andalus he studied with some of the foremost Muslim scientists of his age.

The education of girls was not totally neglected, and while one rarely hears of Jewish girls attaining the high levels of sophisticated learning of some Muslims, there is evidence that many were skilled at least in

Hebrew studies. Illiteracy practically did not exist among Spanish Jews of any age or either sex, as is evident in the numerous letters and other documents in the vernacular languages that have survived.

The Jews of Spain almost universally attained a knowledge of the entire Hebrew Bible that was unmatched elsewhere in the Jewish world. By the twelfth century, at least, Spain had become an international center for Jewish students, who came from France and Germany on a regular basis to study Talmud with the great masters there.

Support for Jewish education was one of the paramount obligations imposed by the law, and special taxes were established in many communities to hire teachers, support students, and maintain schools. Individual Jews, including important government officials of the kings, also gave private donations of money or houses for schools.

Sometimes the kings became involved with the support of Jewish schools, as when, in 1328, Alfonso IV of Aragón-Catalonia granted the petition of a Jew of Lérida that he be appointed administrator of a school for poor Jewish students. This school also had a dormitory where the students lived and probably ate. In 1338 Pedro IV of Aragón had to intervene to ensure that a Jewish teacher of Hebrew would be paid his salary. Again in 1357 he intervened to order the Jewish *aljama* of Exea to comply with the terms of a will providing for the establishment of a school and the salary for a teacher.

Secular education of the Jews in Spain, particularly in Muslim al-Andalus, enabled them to reach high levels of proficiency in science, mathematics, and philosophy. This knowledge was passed on in part to Christians, not only through translation but also through the composition of original works in Spanish. Similarly important was the contribution to Spanish of Bible translations and works of secular literature, such as that of Shem Tov de Carrión, and others, in Catalan.

Whether Jews were admitted to the universities of medieval Spain is unclear; certainly Jewish physicians were required, from at least the fourteenth century, to have received university training somewhere (perhaps at Montpellier). Some received degrees, including the doctorate in philosophy, from Spanish universities. The royal families sometimes used Jews as teachers, and in a famous letter Jaime II of Aragón wrote to his daughter Constanza that he hoped she would not employ Jewish tutors for her newborn daughter, as she had been "accustomed" to do with her other children.

After the widespread pogroms of 1391, Jewish education suffered a decline from which it only gradually recovered by the end of the fifteenth century.

NORMAN ROTH

Bibliography

There are no articles, let alone monographs, on Jewish education in Spain. Some representative texts, often poorly edited, have been assembled.

EDUCATION, MUSLIM

The educational system for Muslims in al-Andalus consisted of three stages: elementary, advanced, and specialized. The first stage centered on the elementary school, the second on study in the mosque, and the third involved often lengthy apprenticeships with scholars in one's chosen field, frequently including extensive travel to study with famous scholars.

The first stage of education was the responsibility of parents. Wealthy parents hired private tutors or occasionally supervised their child's education themselves. Most parents, however, sent their children to private elementary schools, which were diverse in number of students, size, quality, and cost. Children began school when their parents saw fit, usually between the ages of five and eight, and there studied reading, writing, the Qur'ān, and basic levels of language, literature, history, the religious sciences, mathematics, and science. Students could stop their education at any time their parents deemed appropriate. Those taking the full course of elementary study completed it between the ages of thirteen and fifteen, at which time they entered their chosen profession or went on to take advanced training. There is little explicit reference to girls attending school, but educated women from the upper classes, perhaps taught mainly in their parents' homes, are mentioned frequently.

During the second stage, that of advanced education, the venue depended on the field of study. The most common site for study of the religious sciences or fields closely related to them, such as early Arabic literature and history, was the mosque. There students attended classes in individual subjects taught by masters, and progress proceeded book by book. After mastering a book or set of books in a field, a student received a certificate in which the teacher attested to mastery of the book or books and to competence to teach it or them to others. A student then moved to the next level of texts, either with the same teacher or with one qualified for a higher level of study. In this way students both completed their advanced general education and began to specialize in one or more specific areas: grammar, literature, Qur'ān, prophetic tradition, Islamic law, and so on.

Those who wished to specialize in nonreligious studies sought their teachers among recognized specialists in particular fields. Those desiring to enter gov-

ernment bureaucracy became apprentices in chancelleries or other government departments, where they received advanced, on-the-job training. Those interested in medicine, the exact sciences, and philosophy attached themselves to one or more recognized masters who guided them through the theory and practice of their discipline. Often fields became family specialties, so that sons of courtiers and officials entered governmental administration, while children of physicians, such as those of the famed Banū Zuhri family, were trained by their fathers and even replaced them when they retired.

The third stage of education, specialized study with the most famous scholars in a particular field, was optional but very prestigious. At this point students often traveled extensively to centers of learning in al-Andalus, North Africa, and the East. Such travel was essential for maintaining the quality and prestige of regional centers of education. Studying with and comparing one's level of education and expertise with masters and colleagues in other areas of the Islamic world boosted one's career and validated the quality of the education received in al-Andalus. For the religious scholar Mecca and Medina remained the most prominent centers, since there one could meet and measure oneself against students from throughout the Islamic world. For the secular scholar first Baghdad, and then post-Fātimid Cairo, were equally important. By this time the student had become a qualified teacher, and therefore could support himself by transmitting the learning he had acquired in al-Andalus.

In order to comprehend the rationale of the structure of Islamic education, it is essential to grasp the centrality given to the process of oral transmission of knowledge. This explains why traveling to study with diverse experts was so important. When scholars returned to al-Andalus after study in the East, or when prominent scholars from the East traveled to settle and teach in al-Andalus, their arrival signified the importation of new or recently renewed authentic lines of scholarly transmission that extended back to venerated founders and acknowledged masters of each field of specialization. Students traveling to obtain certificates were in fact accumulating scholarly pedigrees.

As is evident from the above, the general structure of premodern Islamic education was essentially private and personal rather than public and institutional. Teaching was done by individuals from one generation transmitting knowledge to those of the next on an oral, interactive basis. As a result the particular geographical or institutional venue of instruction mattered much less than it did in the university system that developed in Christian Europe. Although a city such as Córdoba became famous for its concentration of scholars, in

theory the specific individuals with whom one studied and the students one later taught remained more important than the place where one received instruction.

Despite the ideals of oral transmission embedded in this educational system, learned individuals did value books as an important additional source of learning. Noted scholars at times accumulated extensive libraries in their area of specialization, and accounts exist of the extent to which wealthy individuals valued books as items of social prestige. Large libraries were crucial for the development or survival of certain fields. As a result of his bibliomania, caliph al-Hakam II (r. 961–976) amassed a library that reputedly encompassed over 400,000 volumes. These books, even after they were sold off, looted, and dispersed in the postcaliphate period, provided a basis for the development of philosophy and the sciences in al-Andalus. Libraries and bookstores were places where scholars and bibliophiles met informally to discuss subjects of mutual interest.

EGERIA

Egeria, whose *Peregrinatio* is the first travel book produced in the Christian West, is the most famous medieval woman writer from the Iberian Peninsula. Curiously, she is much better known beyond the borders of the peninsula, perhaps because for many years scholars believed her to be from France (and some still do).

Very little is known about her. Most scholars think that her name was Egeria, not Aetheria or Sylvia, and that she was a rich woman from Gallaecia (Gallcia) province who traveled to the Holy Land and wrote her work overseas in the late fourth century. However, some favor a French origin and an early fifth-century date. The name Egeria is unusual, but it has been found in a document from Oviedo, so the author of the *Peregrinatio* was not the only one with that name. Theories that she was a member of the nobility or an abbess have not been substantiated, nor has the theory that she was a middle-class laywoman. The consensus at present seems to be that, whatever her origin, Egeria was a nun or at least a member of a religious community. Her work obviously is addressed to a congrega-

tion of pious women to which she has strong emotional ties.

The *Peregrinatio* is a long letter to Egeria's fellow nuns that relates her activities and travel, over more than three years, in and around the Holy Land. Although Egeria based her work primarily on her own observations, she also used literary sources. Most of her quotations appear to be from the Bible and the *Onomasticon* of Eusebius of Caesarea. The text, which survives in one manuscript found in the nineteenth century in the library of the Brotherhood of St. Mary at Arezzo by Giovanni Gamurrini, is missing both the beginning and the end.

Through later references to her work by other authors, it is possible tentatively to reconstruct Egeria's trip. It apparently included an initial exploration of Jerusalem, and visits to Alexandria, the Thebaid, and Galilee, before her journey to Mount Sinai, as well as a visit to St. John of Ephesus after her arrival in Constantinople. The first twenty-three chapters narrate Egeria's ascent of Mount Sinai and her retracing of the route of the Exodus, a visit to the tomb of Job at Carneas, and the return trip to Constantinople, including a detour to the tomb of St. Thomas the Apostle at Edessa (modern Urfa) and the house of Abraham in Carrhae (modern Harrae), and another to the shrines of St. Thecla in Seleucia and St. Euphemia in Chalcedon. The last twenty-six chapters describe daily and weekly ceremonies, and the ceremonies of the major holidays from Epiphany through Pentecost and the feast of the dedication of the Basilica of the Holy Sepulchre.

Although there is a very extensive bibliography about Egeria's *Peregrinatio* (over three hundred titles), most studies deal with linguistic and liturgical issues. She is well known among students of Romance philology and church history because her work is an interesting example of Vulgar Latin and contains detailed information about Jerusalem rituals not found elsewhere. Her work has been studied as literature by only a few critics, who think the *Peregrinatio* is impersonal because it limits itself to describing the places visited from the point of view of whether or not they match the places in the Bible. These critics believe Egeria behaves like a Christian speaking to all Christians. Such a view has been questioned by critics who see Egeria's *Peregrinatio* as the work of a woman who writes for other women.

Egeria was not the first person to write about the Holy Land. Many others, before and after her, wrote itineraries (lists of places visited) giving the distance between places and describing each one in greater or lesser detail. The purpose of these itineraries was primarily to serve as guides for future pilgrims. They are

written in the third person and contain little or no information about their authors or their experiences. Egeria's *Peregrinatio*, written in the first person, is a chronicle of her trip. Egeria could not write an itinerary because she was a woman, and women did not write guides addressed to the entire world. Women did not write very much at all. When they did, they wrote mainly things of a private nature, such as letters, often addressed to other women, and that is what Egeria did. Since her fellow nuns were not in a position to emulate her adventure, it was appropriate to justify and share such an uncommon deed by writing a letter. Had Egeria been a man, perhaps she and her peers would not have found her experience so remarkable, and she would not have written her work. Her overwhelming curiosity, scholarly abilities, social skills, and tremendous vitality come through clearly in the *Peregrinatio*, which was truly a woman's adventure.

EIXIMENIS, FRANCESC

A Catalan religious writer, Eiximenis, was born at Girona between 1330 and 1335. He entered the Franciscan order in his youth and studied in Italy, France, and England. In 1374, with the support of the king of Aragón, he obtained the *licentia docendi* at Toulouse University. He was highly esteemed by king Pedro III, while in whose entourage Eiximenis planned the *Crestià*, his ambitious Christian vernacular encyclopedia in thirteen large volumes. The first volume, *Primer del Crestià* (1381), was written in Barcelona and deals with the foundations of Christian dogma. The second, *Segon del Crestià*, which discusses temptation and divine grace, was finished in Valencia, where Eiximenis spent his mature years. In 1383 Eiximenis offered the citizens of Valencia a compendium of moral and political advice, the *Regiment de la cosa pública*, a vast treatise on the nature of human society and its government that was later included in the *Dotzè*. Meanwhile he finished another volume of the encyclopedia, the *Terç* (1384), an extensive description of the seven deadly sins, with theological explanations as well as all

sorts of exempla and practical digressions. The *Dotzè* (1386, with an interpolation of 1391) is the twelfth, and the most popular, book of Eiximenis's encyclopedia. Titled *Regiment de prínceps i comunitats*, it is addressed to princes and kings, as well as to administrative officers with civil responsibilities. The two huge volumes of the *Dotzè* were kept in the city hall of Valencia for public consultation. Presumably Eiximenis did not complete the *Crestià* as planned. In 1392 he finished a very successful treatise on heavenly creatures, the *Llibre dels àngels*, and probably in 1396 a monograph on morals for women: the *Llibre de les dones*. Eiximenis also produced a *Vida de Jesucrist* (ca. 1400), which enjoyed great success and was designed to teach a personal approach to the human and divine figure of the Son of God, in the manner of Ludolph of Saxony and Ubertino of Casale's Latin *Vitae Christi*. Eiximenis's Latin works include an *Ars praedicandi*, a *Pastorale* giving advice to the bishop of Valencia, and a *Psalterium alias Laudatorium papae Benedicto XIII dedicatum*. The prayers of the latter were translated into Catalan in 1416.

Eiximenis supported Pope Benedict XIII, who in 1408 designated him patriarch of Jerusalem and bishop of Elna. He died at Perpignan, France, in April 1409. His books enjoyed a great success: There are many extant manuscripts of some of them; others were translated into Spanish and even into French; and some were printed in the fifteenth century. Eiximenis was a compiler deeply indebted to his sources (the great Franciscan writers of the thirteenth century, the treatises on vices and virtues), but he was also an extraordinarily talented vernacular prose writer and an acute observer of his times. His writings provided a fruitful bridge between the learned church traditions and the cultural needs of the inhabitants of the Catalan towns of the late Middle Ages.

ELEANOR OF CASTILE

Eleanor (ca. 1161–1214) was the second daughter of Eleanor of Aquitaine and Henry II of England. She was born at Rouen in Domfront Castle and was married to Alfonso VIII of Castile in 1170. Her dowry included Gascony; in return Alfonso endowed her with holdings in the north of Castile, near the border with Navarre

and Gascony. Both the marriage alliance and the location of Eleanor's lands may have influenced Henry II to decide in favor of Castile when he was asked to adjudicate a boundary dispute between Alfonso and Sancho VI of Navarre in 1177. However, the Castilians were never able to claim her dowry. Alfonso VIII tried to occupy Gascony in 1204–1206; Alfonso X renounced all claims to it in 1255 upon the marriage of his sister to the future Edward I of England.

Eleanor's first surviving child, Berenguela (born ca. 1180), married Alfonso IX of León; her other children were Urraca (born ca. 1186/1187), who married Afonso II of Portugal; Blanche (b. 4 March 1188), who married Louis VIII of France in 1200; Fernando (29 November 1189–1211); Constanza, abbess of Las Huelgas (d. 1243); and Enrique (b. 14 April 1204), who at her death became Enrique I.

Eleanor is thought to have followed her mother's lead and been a patron of troubadors in Castile. She established an altar to Thomas Becket at Toledo on 30 April 1179. With Alfonso she established the Cistercian convent of Las Huelgas at Burgos on 1 June 1187 (Rodrigo Jiménez de Rada gives her sole credit as the founder of the convent and the royal hospital there). Las Huelgas served many of the functions of Fountevrault for the Castilian royal family. According to Jiménez de Rada, Eleanor convinced Alfonso VIII to marry their daughter Berenguela to Alfonso IX of León in 1197. Eleanor had been named regent for Enrique, but she died within a month of Alfonso VIII in 1214, and was buried with her husband at Las Huelgas.

ELVIRA

Elvira was the daughter of King Ramiro II of León and Urraca, the daughter of King García II Sánchez of Navarre. About 946, when she was roughly twelve years old, Elvira became a nun in the convent of San Salvador, which her father had established. From relative obscurity there she reemerged during the reign of her nephew, Ramiro III of León (966–984), who had acceded to the throne at the age of five. Despite her status as a religious, Elvira served as regent during his minority. Little is known of her responsibilities, except that she must have had to deal with a serious Viking invasion of Galicia in 968. Muslim sources inform us that she sent an embassy to the court of the caliph of Córdoba, Al-Ḥakam II, in November 973. They do not detail the substance of the negotiations, however. The

last known notice establishes that she lived until at least 986.

ENACIADOS

As a marginal socioeconomic class, *enaciados* were an inevitable development of the peculiar circumstances on the medieval Hispanic frontier between Christians and Muslims. Guides, interpreters, messengers, or spies, *enaciados* were linguistically and culturally ambivalent, as at home in one ethnoreligious community as in the other. Although Alfonso X's *Estoria de España* alludes to "evil men, now called *enaziados*, who reveal to the Moors what Christians intend to do," the Christians gladly made use of their services. Thus Alfonso XI promised to maintain contact with Ruy Pavón, his spy in Granada, "by sending him men, called *enaciados*, who speak the language of the Moors." Probably based on a conflation of Arabic *naziʿ* (turncoat) and *naziḥ* (emigrant), the word also designated an individual who switched from one religion to another, to become, according to the *fueros*, a traitor and a criminal deserving the severest punishment. But the presence of communities of *enaciados* on the *frontera* substantiates their utility as a distinctive social group. The term survived in toponymy until recent times in Puebla de Naciados (Cáceres province).

ENAMEL

Enamel is a glass powder composed of a basic mixture of lead and borax, to which are added metallic oxides like iron (producing a red color), antimony, lead, and silver (yellow), cobalt (blue), copper (green), and so forth. These oxides generally leave the powdered glass transparent, though if they contain zinc or arsenic, they can turn the enamel opaque. The powder is later applied to various substances, principally metal sheets (gold, silver, iron, and copper) coated with a flux to

facilitate adhesion. Its temperature of fusion is 700–850 degrees Celsius (1300–1550 Fahrenheit).

The techniques employed in medieval enamelwork were:

Cloisonné [alveolado]. Of Byzantine origin, this process begins with the attachment of metal strips following the outline of a decorative pattern or drawing on the metal sheet. The cells formed by the metal walls are filled with enamel powders of different colors and then baked. This process is commonly used on sheets of gold or silver, and less often on copper.

Champlevé [excavado]. Characteristic of the Western Romanesque, this technique is executed on copper by gouging small grooves which are then filled with enamel powder and fused.

Basse-taille [traslúcido]. Typical of the Gothic era, this method is performed on gold or silver sheets engraved with bas-relief designs, or on round figures. The powders used in this technique are translucent, allowing the underlying low-relief composition to show through.

One example of the cloisonné technique is the enamelwork on the Cruz de Victoria of the Asturian period, a product of the royal workshop of Castillo de Gauzón in Avilés. In the latter part of the twelfth century, the abbey of Silos in Burgos was the major center of Iberian enamelwork. Works like the urn that adorned the tomb of Santo Domingo display the personality and exceptional quality of the Spanish enamels. The artwork on the altar of San Miguel de Aralar in Pamplona indicates the collaboration of craftsmen from both Spain and Limoges (France). During the Gothic era, the Catalan and Levantine workshops take precedence, with works like the altarpiece of the Cathedral of Girona, or the Cross of Xàtiva. In the Muslim world, the kingdom of fourteenth and fifteenth century Granada stands out. Decorative pins, belt buckles, necklaces, and sword sheaths/hilts were decorated with cloisonné enamels.

ENCINA, JUAN DEL

A man of prodigious talent and driving ambition, Juan del Encina was born, in 1468, into the musically gifted family of a prosperous Salamanca cobbler. Under the tutelage of his older brothers, one a professor of music

at the University of Salamanca and the other a chorister of the cathedral, Encina soon became an accomplished musician. His skill is evidenced by an extant corpus of sixty-two original works, the largest of any musician of the period. Several of his compositions are dedicated to Prince Juan, suggesting that he enjoyed favor at the Aragónese court of Fernando II.

As a student of the humanities at the University of Salamanca, Encina met two distinguished figures who would significantly influence his literary career: Antonio de Nebrija, who taught him Latin and rhetoric, and Gutierre de Toledo, chancellor of the university and brother of the second duke of Alba. In 1492 Encina became part of the duke's household, as creator of musical and theatrical entertainments. It was in this sumptuous, aristocratic milieu that Encina began his remarkable dramatic output and aggressive bid for professional advancement.

Encina's reputation rests primarily on the *Cancionero* of 1496, a collection of lyrics, long poems, original and translated prose works, and dramatic eclogues that he carefully prepared for publication. The volume contains a remarkable number of firsts in Spanish literary history: the first treatise on poetic theory (*Arte de poesía castellana*); the earliest rendering of Latin verse in Castilian meter (a paraphrase of Virgil's *Bucolics*); and the eight pastoral eclogues that have earned him the title "father of the Castilian theater."

The playlets that Encina produced and acted in at the ducal court were to have a lasting influence on Iberian drama throughout the sixteenth century. Their single greatest contribution was the character of the shepherd (*pastor*), the uncouth, unkempt, and ignorant rustic whose highly expressive stage language of *sayagués* Encina modeled on the rural dialect of his region. On one level the *pastor* was simply a comic figure intended to elicit laughter from a noble audience. In Encina's hands, however, he also gave voice to a variety of serious issues, such as social conflict, religious disharmony between Old and New Christians, and the difficulties of the artist-patron relationship. Last but not least, and aided by the fact that Encina often played the role himself, the shepherd became a vehicle for blatant self-promotion.

A notable lack of dramatic illusion often complements the multifarious role of the shepherd. In eclogues 1 and 2, for example, the shepherds are alternately contemporary Salamanican rustics guarding the duke of Alba's flocks, the four Evangelists, and biblical witnesses of the Nativity; one of them also represents the playwright and his anxieties about receiving adequate recognition from his patrons.

Another important influence on Encina's theater is clearly evinced in the final eclogues of the 1496

collection: the vast body of fifteenth-century love lyrics. In order to dramatize the power of love to transform lives and equalize social differences, eclogues 7 and 8 in particular draw heavily on the language and concepts of this amatory verse.

Social harmony becomes more elusive and love less benevolent in Encina's six remaining plays, probably written between 1493 and 1499. Eclogue 9, a Christmas play, deals only marginally with the Nativity, dwelling instead on the desolation wrought on town and country by the great rains of 1498 and the squabbling of four shepherds seeking shelter from the storm. The work seems to reflect a growing disillusionment, common to Encina's generation, with the possibility of peaceful coexistence between Old and New Christians in Spain.

It is believed that Encina's failure to secure ecclesiastical advancement and his continuing dissatisfaction with the Duke of Alba's patronage caused him to leave the latter's employ sometime around 1498. Shortly thereafter he left Spain for the first of three extended stays in Rome.

Encina's best-known works, eclogues 11–14, reflect his experience of the cultural wealth of Renaissance Rome, where his musical talents gained him the protection of three successive popes. The plays are noteworthy for their greater structural complexity, their borrowings from classical and Italian literature, and their increasing secularization, culminating in the sacrilegious suicide for love that occurs in eclogue 14, *Égloga de Plácida y Victoriano*. Eclogue 11, *Égloga de Cristino y Febea*, is generally regarded to be Encina's most accomplished. Although he had previously dramatized its theme of love's power to resolve conflicting values and lifestyles, here he achieves a more highly developed scenic structure.

Égloga de Plácida y Victoriano was performed in 1513. Some six years later Encina was ordained a priest and went on pilgrimage to Jerusalem. He spent the last ten years of his life (ca. 1520–ca. 1530) as prior of the cathedral of León. He had written the plays that determined the shape of Spain's secular theater before the age of thirty.

ENGRAVING

Engraving was introduced in Spain with printing by German masters via Italy in the decade of the 1470s, as documented in the *Sinodal de Aguilafuente* (1472). The history of Spanish engraving begins with the consolidation of the printing industry in the period 1476–1480. The xylographic press was introduced immediately and anonymously created images engraved on wooden plates predominated during the early years of Spanish printing. The only Spanish metal engraving plate preserved from the period is that of *La Virgen del Rosario* by Domenech. Early Spanish engravings are distinguished by their decorative style, inspired by Venetian motifs enriched with elements of Islamic design. The images on the first Spanish xylographs are generally based on Italian and German sketches, which were either imported directly or copied from other sources. It is only during the last decade of the fifteenth century where one begins to see the emergence of an autochthonous style that could be referred to as uniquely Spanish.

In Zaragoza, the Hurus firm published important illustrated books during the first years of printing in the peninsula: the *Aurea Expositio Hymnorum* (1492), with plates closely related to Schongahuer; the *Thesoro de Passion* by Li (1494); and the *Viaje a Tierra Santa* by Breindenbach (1498). In Valencia, L. Palmer published the *Obres e Trobes* (1477). A clear example of Italian influence on engraving may be found in the edition of *Cárcel de Amor* by Diego de San Pedro (1493). Bartolomé Segura and Alfonso del Puerto produced the first illustrated book in the kingdom of Castile, the *Fasciculus Temporum* by Rolewinck (Seville, 1480), with both wood and metal engravings inspired by German models. Meynardo Ungut and Stanislaw Polono established their engraving facility in Seville in 1490 and were instrumental in promoting the first printing press in Granada. *Los doze trabajos de Hércules* by Enrique de Villena (1483) is a work that contains the first engravings by a native Spanish artist, an anonymous master trained by German printers. Finally, the portrait of Prince Alfonso in the *Regimiento de príncipes* (1494) incorporates the courtly pictorial style of the fifteenth century. Many of the engravings produced at the end of that century reflect a Spanish-Flemish style that embodies a deep synthesis of both national and foreign elements.

ENRIQUE DE ARAGÓN

Enrique de Aragón, also known as Enrique de Villena (1384–1434) was a fifteenth-century Castilian-Aragónese polymath intellectual reputed to be a sorcerer on the basis of his interest in the sciences and the preternatural. His father, Don Pedro, descended from the royal line of Aragón. His mother, Doña Juana, was the illegitimate daughter of Enrique II of Castile. Orphaned in infancy, he became a ward of his paternal grandfather Alfonso, Marqués de Villena, who took him to Aragón and attempted to educate him for a military career, which Enrique abandoned in order to pursue his intellectual curiosities. (Contrary to popular belief, Enrique never held the title of Marqués de Villena). Fernán Pérez de Guzmán includes an interesting portrait of Enrique in his *Generaciones y semblanzas*. Studious by nature, Enrique was drawn to the sciences, especially alchemy, astrology, and mathematics. Frustrated by life at court, he retired from society to pursue his academic interests. Upon his withdrawal from society, his reputation as a sorcerer and necromancer began to grow, while many acquaintances, on the basis of his renown, sought to flee his company. In an effort to engage him with the world, Enrique's grandfather arranged a marriage to María de Albornoz, a failed union that Enrique soon petitioned the king to dissolve.

In 1404 Enrique joined the military order of Calatrava without passing through the customary observances required of all novices. That same year, upon the death of Gonzalo Núñez de Guzmán, the grand master of the order, Enrique was elected to succeed him. Enrique's election produced deep dissent among many knights of the order, who voted to oppose his election on the basis of his notoriety as a magician and sorcerer. After years of litigation, the disputed election was resolved in 1414 by deposing Enrique, who had failed to get the necessary support of his uncle Enrique III, and could not count on help from Juan II that king's infant successor. Luis de Guzmán, son of the former head of the order of Calatrava, was elected grandmaster in don Enrique's place. At the same time, Enrique suffered another blow when the pope overturned the divorce from María de Albornoz granted to him by Enrique III. Disillusioned and economically pressed,

Enrique retired to his estates at Iniesta to pursue a life of study.

As he withdrew more and more from the world, especially during the last decade of his life, Enrique de Aragón's reputation as a practitioner of the black arts grew considerably. The legend of his sorcery, necromancy, and magic spread throughout Castile and Aragón. As requested in his last will and testament, Enrique's works were examined for their orthodoxy and the ones found lacking were burned. Even then, after his death, his books were confiscated by order of Juan II and burned by Fray Lope de Barrientos, enlarging Don Enrique's legend to such an extent that his name became synonymous with the occult, medieval mystery, and witchcraft. This legend endured well into the nineteenth century, when Juan Eugenio Hartzenbusch made Don Enrique the protagonist of his play, *La redoma encantada*, about magic and the supernatural during the Middle Ages.

Although Enrique de Aragón's personal academic preferences tended toward the sciences and philosophy, his surviving scientific and philosophical works, although they show his fascination with arcane subjects, are highly derivative. Many of his theories are reformulations of Averröes and Avicena, when they do not reflect borrowings from Aranu de Vilanova. Don Enrique's intellectual distinction and his firm reputation as a humanist rest on his achievements in arts and letters. His Castilian translations of Homer, Dante, and Petrarch (the *Eneida*, *Divina comedia*, and a sonnet); his *Arte de trovar*, his *Los doze trabajos de Hércules*, and *Exposición del salmo "Quoniam video,"* plus his *Arte cisoria o tratado de cortar de cuchillo*, a treatise on culinary etiquette, reveal him, along with his friend, Íñigo López de Mendoza, Marqués de Santillana, as one of the two most agile and original humanistic intellects in late medieval Castile and Aragón.

ENRIQUE DE VILLENA See ENRIQUE DE ARAGON

ENRIQUE I, KING OF CASTILE

Enrique I (b. 1204), the only surviving son of Alfonso VIII (r. 1158–1214), succeeded his father while still a minor. Alfonso VIII's will named Enrique's mother, Eleanor, as his regent, but she died less than a month after her husband. Berenguela, Enrique's oldest sister and former wife of Alfonso IX of León, took their mother's place and obtained custody of Enrique and of the realm. But by 1215 a group of nobles sought custody of Enrique, and Berenguela relinquished him to Count Álvaro Núñez de Lara, on the condition that he could not make war, grant property, or impose tribute without her consent. Despite these conditions Enrique's brief reign was marked by conflict between Álvaro Núñez and Berenguela. Berenguela accused Álvaro of endangering Enrique's health, and he claimed that Berenguela sent assassins after her brother. Either to diminish Berenguela's influence or to eliminate her from the government entirely, Álvaro negotiated a marriage between Enrique and Mafalda of Portugal in 1215, but Berenguela arranged to have the marriage annulled. Núñez's regency ended when Enrique died 6 June 1217 at Palencia, from a head wound received while playing. Álvaro Núñez tried to keep news of Enrique's death from Berenguela, but she found out and secretly summoned her son, Fernando, who was living with his father, Alfonso IX of León. She yielded her rights to the crown to Fernando in an assembly at Valladolid 2 July 1217. Enrique was buried at Las Huelgas Monastery in Burgos.

ENRIQUE II, KING OF CASTILE

Son of Alfonso XI, king of Castile, and his mistress, Leonor de Guzmán, Enrique II was born in Seville in 1333. He was adopted by the magnate Rodrigo Alvarez de las Asturias, from whom he received the *condado*

of Trastámara, which provided the name of the dynasty initiated by Enrique. In 1350, he married Juana Manuel, daughter of the author and aristocrat, Juan Manuel. He died in Santo Domingo de la Calzada in May 1379 and was buried in the cathedral of Toledo.

From a very young age, Enrique opposed the kingship of his stepbrother, Pedro I of Castile, who had been accused of cruelty and of favoring the Jews. After the failure of the first uprisings against Pedro I in 1356 and 1360, Enrique, aspiring to crown himself king of Castile, sought strong military and diplomatic support before renewing the attacks. He found this support in two places: in the *Compañías Blancas* led by Beltrán Du Guesclin of Brittany in Aragón, who signed the Treaty of Monzón with Enrique in 1363, and in the pope, who consecrated the projected campaign as a crusade. In March 1366, Enrique invaded Castile, crowning himself king in Burgos the next month. As the illegitimate prince was waging his offensive, which reached as far as Seville, his stepbrother Pedro fled, seeking help from the English. But the defeat that Enrique suffered in Nájera (April 1367) at the hands of Pedro I and the English temporarily crippled his plans. He had to seek refuge in France, although he was able to return to Castile at the end of 1367. At that point a corrosive war between the brothers began, with Enrique increasingly gaining the upper hand, due to the economic travails of the time as well as the growing unpopularity of his rival. The assassination of Pedro I in Montiel (March, 1369) cleared Enrique's path to the Castilian throne.

The political outlook Enrique faced in the spring of 1369 was far from promising. In the Castilian interior, several regions maintained loyalty to Pedro I, including Carmona, Zamora, and a large part of Galicia, but an anti-Castilian coalition composed of the remaining Spanish kingdoms was forming. In 1371 the pockets of *petrista* support were crushed; at the same time, due to the signing of the treaty of Santarem with the Portuguese, its defensive strongholds along the frontiers of Aragón, Portugal, and Navarre crumbled. In 1375 the Treaty of Almazán made peace between Enrique II and Pedro IV of Aragón, who agreed to yield Molina to Castile, abandon his claims to Murcia, and consent to marriage between his daughter Leonor and Juan, the heir to the Castilian throne. Only the conflict with Navarre remained, though with the Treaty of Santo Domingo de la Calzada in 1379, this too was resolved. Clearly, between 1371 and 1379 the foundations were established for Castile's future hegemony in the Iberian Peninsula.

On the international front, Enrique II's rise to power produced a period of close alliance between

Castile and France, beginning with the Treaty of Toledo, signed in 1368 by the illegitimate prince and delegates sent by the king of France. As a result of this accord, Castile aided France in the Hundred Years War: its participation was particularly notable in the naval victory at La Rochelle (1372) and in the sacking of the Isle of Wight (1373). Accompanying the French alliance was Castile's hostility toward England; their economic rivalry acquired political motives as the duke of Lancaster laid claim to the Castilian throne due to his marriage to Constanza, daughter of Pedro I.

The generosity Enrique II displayed to the noblemen that helped him acquire the throne explains why he received the nickname "*el de las mercedes*" (he of the favors, or mercies). For the high Castilian nobility, Enrique II's ascent to the throne provided a prime solution for the problems created by the deep economic crisis of the time. For the crown, on the other hand, the *mercedes enriqueñas* produced a considerable decrease of royal property. Enrique's donations to his supporters consisted largely in seigniorial territories whose beneficiaries received revenues and possessed jurisdictional rights. Enrique II gave territories to captains of foreign troops such as Du Guesclin, who received but never occupied Soria and Molina, and Bernal de Béarne, who was awarded Medinaceli. The king's brothers, Sancho and Tello, were also beneficiaries of royal *mercedes*, as was his illegitimate son Alfonso Enríquez. But the majority of the donations were made to nobles, both from time-honored, traditionally powerful lineages (the Guzmán family, for example) and from social-climbing, newly powerful groups (like the Mendoza or Velasco families). Despite everything, Enrique II managed to slow down the negative impact these concessions had on the royal estates, establishing restrictive norms regulating their primogeniture succession.

In the political realm Enrique II strengthened the crown's power. In 1371 the seven-member *Audiencia* was established, serving as the kingdom's high court of justice. Also notable was the development of a system of estate administration, which by the end of the monarch's reign had taken the form of a *casa de cuentas* (billing house). Enrique II also called for frequent meetings of the *cortes* (parliament), which served as an essential instrument of dialogue with the kingdom and its cities. The principal sessions of the *cortes* occurred in Toro in 1369, when important legislation regarding price and salary regulation was approved, and in 1371. In conclusion, Enrique II lay the groundwork for the modern state in Castile.

In Enrique II's times, the tolerance that until then had prevailed between Christians and Jews began to

crumble. Anti-Semitic propaganda, supported by the monarch during the war with his brother, led to violent attacks against numerous Jewish groups in Castile. Also supporting this trend were the intense criticisms made by the third estate of the *cortes* against the Jews. Once he had assured his place on the throne, Enrique II clearly changed his attitude, attempting to protect the Jews, even naming some to governmental positions, such as Yuçaf Pichon, *almojarife mayor* (chief tax collector) of the king's estate. But the anti-Semitic sentiments of the popular Christian sectors of Castile were already unstoppable.

ENRIQUE III, KING OF CASTILE

Enrique III was the son of Juan I of Castile and Leonor of Aragón. He was born in Burgos on 4 October 1379 and died in Toledo in 1406. He is often given the sobriquet *el Doliente* (the sufferer) because of his early death and the poor health he suffered from all his life. He was married to Catherine (Catalina), the daughter of John of Lancaster, who reigned as queen regent after his death.

Enrique was only eleven when in 1390, on his father's death, he acceded to the throne. After a controversy over his father's will and intention regarding his guardians, a regency council under the guidance of Pedro Tenorio, Archbishop of Toledo, was installed to direct the kingdom and watch over the boy during his minority. The arrangements lasted only into 1391, when deep divisions among the ambitious nobles who formed the membership emerged. The situation was immediately aggravated by a series of calamities that confronted the monarchy with a set of difficult decisions. Most important among those events was the anti-Semitic violence that broke out in Seville in the spring and spread throughout the kingdom during the rest of the summer. The council's internal divisions were resolved only by means of the actions of Enrique's aunt, Leonor, Queen of Navarra, who with the assistance of

the papal legate, arranged for the disputing parties to accept with some modifications the original guardians Juan I had named for the boy in his will. The following year was followed by trouble with the kingdom of Granada, and the Portuguese with whom a truce was finally reached in 1393. Despite all earlier efforts, discord among the members of the regency council continued and, Don Pedro Tenorio, who threatened to resign, was taken prisoner and forced to turn over several fortifications under his protection. Deeply affected by the situation, yet still a minor, in August 1393 the young king declared his determination to govern and convene the *cortes* (parliament) in Madrid for October, the month he would turn fourteen and become legally of age. When the *cortes* convened at the appointed time, the king guaranteed the rights and privileges of his subjects and revoked all actions taken by the regency council during his minority to confer *mercedes* (grants of land, titles, privileges, and money). At the same time, he asked the *cortes* for moneys to shore up the kingdom's ailing finances.

Despite the young king's move to consolidate his authority, the contentious nobility remained a thorn in his side for the duration of his reign, fomenting discord with the king of Granada; his aunt, the queen of Navarra, who had been estranged from her husband Carlos *el Noble*, and the count of Gijón, Alfonso. In 1396, Portuguese troops crossed the border into Extremadura and took Badajoz by surprise, a move that was met by Castilian strikes that devastated the Lusitanian countryside and saw naval attacks along the Atlantic by Diego Hurtado de Mendoza, Admiral of Castile, that punished coastal cities. Hostilities ended when the Portuguese sued for peace. By 1398, Enrique was embroiled in papal politics, denying Castile's support, along with France, for Benedict XIII, the antipope Pedro de Luna. The last years of Enrique II's reign were marked by increased hostilities with the Muslims along the Granadan frontier. At the initiative of Muhammad VI belligerence intensified. Determined to take action against the new king of Granada, Enrique gathered an army to respond but died at Toledo before he could take the field.

Despite his promise and good intentions, Enrique III, like his son Juan II after him, would accomplish little to overcome the crippling effects of a contentious nobility that consistently confused the interests of the realm with their personal ambitions.

ENRIQUE IV, KING OF CASTILE

The son and heir of Juan II, Enrique was born at Valladolid on 25 January 1425. He did not take an interest in governance or politics until the last years of his father's reign, when he threw his support behind the nobles, whose efforts against Álvaro de Luna, Juan II's favorite, were led by Juan Pacheco, Marqués de Villena. When Juan II died in 1454, Enrique acceded to the throne of Castile. Irresolute and indecisive, however, he was incapable of exercising authority and left the work of governance largely to the energetic and ambitious Villena, his favorite, with whom he was rumored to have a homosexual liaison.

In 1440 Enrique had married Blanca of Navarra, the daughter of Juan II of that kingdom. By 1453, however, the marriage was dissolved amid rumors that Enrique was impotent and that the union had never been consummated. As a result, he is sometimes referred to as *el rey impotente*, or Enrique the Impotent. The consequences of the king's perceived impotence, linked with other events, would prove far reaching for monarchical succession in Castile during the second half of the fifteenth century.

In 1455 Enrique took a second wife, Juana of Portugal, who in 1462 gave birth to an heir, Juana of Castile, often referred to as *la Beltraneja*. This pejorative sobriquet reflected the belief that the princess's real father may not have been the king but rather Don Juan Beltrán, a high official at court reputed to have been her mother's lover.

Although on 9 May 1462 the *cortes* of Castile, attended by leading churchmen and the magnates of the realm, swore allegiance to Princess Juana as Enrique's rightful heir, and the king instructed all jurisdictions in the kingdom to do the same, rumors of the princess's illegitimacy began to circulate widely throughout Castile, amid a general malaise and dissatisfaction with the king. By 1465 Enrique was compelled by the nobles to recognize his adolescent half-brother, the Infante Alfonso, as his legitimate heir to the throne. Still dissatisfied, some of the nobles in June of that year, in the so-called Farce of Avila, deposed Enrique in effigy and proclaimed Alfonso King of Castile, leading to widespread civil unrest in the kingdom. Although the rebels were defeated at Olmedo in 1467, the mysterious death of the Infante in 1468 renewed and aggravated tensions. The allegations regarding Juana's illegitimacy endured at the center of controversy and continued to cloud Enrique's reign and the ques-

tion of his succession. Pressure from the nobles persisted. They now favored the succession of Enrique's half-sister, Isabel of Castile, whom the king was then forced to recognize as his immediate heir at Los Toros de Guisando on 19 September 1468. Some historians have generally been willing to interpret this act as the king's implicit acknowledgment that Princess Juana was not his daughter. However, even if she were his daughter, as she was by juridical presumption, he might have yielded to the weight of the powerful nobles, who sought to give the crown immediately to Isabel. It is therefore possible that Enrique may have compromised with the nobles by making Isabel his heir.

After the conclusion of the Pact of Los Toros de Guisando, Isabel was at odds regarding Enrique's plans for her marriage. As early as 1460, the king had offered Isabel's hand to Carlos, Prince of Viana, eldest son of Juan II of Aragón and heir to the Kingdom of Navarre. Alienated from Carlos, Juan II, however, wished Isabel to marry his younger son, Fernando of Aragón. Negotiations were protracted until the death of the Prince of Viana. In 1465 Enrique made an attempt to arrange marriage between Isabel and Afonso V of Portugal, but the princess had already chosen Fernando of Aragón. For the same reason she also refused to marry Pedro Girón, master of the Order of Calatrava and brother of Juan Pacheco, the powerful Marqués de Villena. Other aspirants for Isabel's hand were Richard, Duke of Gloucester, brother of Edward IV of England, and the duke of Guyenne, brother of Louis XI of France. The *cortes* (parliament) assembled at Ocaña in 1469 to ratify the Pact of Guisando when a Portuguese embassy arrived to renew Afonso V's suit for Isabel's hand. When she declined this alliance, Enrique threatened her with imprisonment in the Alcázar of Madrid.

Although fear of Isabel's partisans among the nobility prevented the king from carrying out his threat, he exacted a promise from his sister not to enter into any matrimonial negotiations during his absence in Andalusia. As soon as she was left alone, however, Isabel—with the aid of the archbishop of Toledo, Alfonso Carrillo, and the admiral of Castile, Fadrique Enríquez (the grandfather of her future husband)—fled to Valladolid. From there she sent Gutierre de Cárdenas and Alfonso de Palencia in search of Fernando, who had been proclaimed King of Sicily, and heir of the Aragónese monarchy after the death of the prince of Viana. After Fernando's harrowing journey in disguise into Castile, Fernando and Isabel were married in Valladolid on 19 October 1469. The event created a tension that ceased only with the king's death on 11 December 1474, shortly after his return from Trujillo

and the sudden, unexpected death of the Marqués de Villena. Isabel was proclaimed Queen of Castile the following day and Juana, who had in the interim become betrothed to Afonso V of Portugal and been reinstated as Enrique's heir when he revoked the Pact of Los Toros de Guisando, sought to press her claims via an alliance with the Portuguese. The archbishop of Toledo and other nobles who in Enrique's lifetime had denied Juana's legitimacy now defended her claims. The competing claims set off a five-year war between Castile and Portugal that ended in 1479, when Juana abandoned her case and retired to the monastery of Santa Clara of Coimbra (1480), from which she was never allowed to leave.

Research on the reign of Enrique IV has been hampered by the substantial lack of documentation, the disappearance of which can be traced to the diligence of Queen Isabel's loyal retainers. With few exceptions, most of the surviving testimonials of his reign are highly partisan, staunchly pro-Isabelline, and portray the king in an exceedingly negative light. In addition to the monumental problem of succession that hampered his reign, Enrique IV's time on the throne was marked by additional tensions and calamities. In 1455 and 1457, he was responsible for two disastrous campaigns against the Muslims of Granada that nearly ended with the revolt of the army. Not understanding economics, he later granted the privilege of coining money to private individuals, touching off devastating inflation. All the same, recent studies have indicated that many of the administrative reforms credited to Fernando and Isabel actually began under his initiative, and Enrique IV's role as a major patron of the arts is also beginning to emerge.

ENRIQUE, INFANTE OF ARAGÓN

Enrique was one of the younger sons of Fernando of Antequera and Leonor of Alburquerque. On the death of Enrique III of Castile in 1406, Fernando of Antequera became coregent during the minority of Juan II. Subsequently he became Fernando I of the Crown of Aragón after the Compromise of Caspe (1412), but he had used his regency in Castile to pursue his family's interests. Thus Enrique, who inherited the lands of his mother, devoted most of his ambitious life to the complicated politics of Castile. By 1409 Fernando had secured the mastership of the Order of Santiago for En-

rique, and from then on, the latter was involved in almost every major political disturbance until his death in 1445.

When Juan II came of age in 1419, Enrique planned to secure a personal power base through the Order of Santiago. By criticizing abuses and the privileges that were being given to the followers of his powerful elder brother, the infante Juan, Enrique mounted a political offensive. Then, taking advantage of his elder brother's absence from the court, he engineered a coup d'état at Tordesillas on 24 July 1420. The king was captured; Enrique organized a sham *cortes* (parliament), married the king's sister Catalina, and secured the marquisate of Villena as part of her dowry.

Enrique's triumph was short-lived. The king and his favorite, Álvaro de Luna, managed to escape, and in 1422 Enrique was arrested and imprisoned. The internal politics of Castile were, however, subject to the intervention of Enrique's two brothers, Alfonso V of Aragón, and the infante Juan, who became King of Navarre late in 1425; between them they secured his release from prison in 1426.

At liberty Enrique devoted his efforts to undermining Luna, whom he clearly detested. Luna, however, was more than a match for him, and when Alfonso V threatened invasion in 1429, he converted what was in reality an internal crisis into a foreign war, crushed Enrique, and took control of the Order of Santiago. In July 1430 the Truce of Majano ended the war, and the infantes of Aragón were prohibited from living within the kingdom of Castile.

The vast increase in Luna's power provoked unrest, and when a revolt broke out in 1439, Enrique seized the opportunity to return to Castile, securing the restoration of all his lands and lordships shortly afterward. Royal government was to be controlled by the Royal Council, including Enrique and his brother Juan of Navarre, and in 1441 Luna was sentenced to six years of exile from the court.

However, government by the Royal Council was never more than a fiction, and by a coup d'état at Rámaga in July 1433, Juan of Navarre dropped all pretense of sharing power and purged the court and central administration. For two years Juan of Navarre and Enrique were the de facto rulers of the kingdom, but Juan II of Castile again escaped and joined Luna and other supporters. On 19 May 1445 a decisive royal victory was gained at Olmedo. Shortly after, Enrique died from a wound he received in the battle.

Like many of his noble contemporaries, Enrique was a devotee of chivalric spectacle and pageantry, and it may well be that Cervantes derived his idea for the famous episode of Don Quixote and the windmills from reading Carillo de Huete's description of an elab-

orate fiesta organized by Enrique at Valladolid in 1428. At one point during the joustings at this fiesta, the king of Navarre appeared in the company of twelve knights, all of them costumed as windmills.

ENRÍQUEZ DEL CASTILLO, DIEGO

Enríquez, born in 1443, became a priest and subsequently was one of the chaplains to the king at the court of Enrique IV of Castile. A minor political figure, his importance lies in the fact that he was one of the official royal chroniclers and the author of the *Crónica de Enrique IV*.

The king aroused conflicting emotions among those who chronicled the events of his reign. Alonso de Palencia, another official and salaried chronicler, loathed him, and his account, full of vituperation, is a masterpiece of character assassination. Enríquez's chronicle provides a contrary view, ostensibly because he believed that the king was God's anointed and because "los corazones de los reyes están en las manos de Dios" (the hearts of kings are in God's hands). He repeatedly refers to the rebel nobles with such terms as *tiranos* and *tiranía*, and to the disaffected in general as *los pueblos ignorantes*. But he was far less subtle than Palencia, and at times almost naive. There was little of the humanist in Enríquez, despite the occasional classical reference, and in his prose he was much given to lengthy and conventional reflections, exclamations, invocations to God and the reader, and the reporting of rhetorical speeches that he attributed to the protagonists of the events he was describing.

Enríquez's chronicle must be assessed in the light of two specific contexts. The first relates to an unfortunate incident in which he was involved while at Segovia in 1467. According to Alonso de Palencia, Enríquez's papers and belongings were seized by royal opponents, and shortly afterward the unfortunate chronicler was taken before the archbishop of Toledo. The latter read extracts from Castillo's chronicle to members of the opposition nobility who were present, and only the chronicler's priestly status saved him from being condemned to death by King Alfonso V (Enrique IV's half brother and rival king). Enríquez himself briefly records this incident. With his material in the hands of the rebels, he had to start writing his version of events all over again, presumably mainly from memory, a fact that probably accounts for his

confusion about the exact chronological details of certain events.

The second context involves a letter that Enríquez wrote to Queen Isabel the Catholic years later. In it he complained about the nonpayment of his salary of 37,000 *maravedís* as an official chronicler, and then went on to offer his pen in her service, proposing to write in her support if his pay were restored. Money, it would appear, could easily affect his opinions and his description of events.

Nevertheless, Enríquez's chronicle frequently contains valuable material that is missing or imperfectly recorded in other sources. Such is the case, for example, with his account of the virulent and inflammatory sermons against Jews and *conversos* (Jews who converted to Christianity) preached at the royal court in 1463 by the Franciscans Alonso de Espina and Fernando de la Plaza, to which the king reacted in a remarkably shrewd and rational way, and his account of the "republican" uprising and conspiracy in Seville of Archbishop Fonseca and the *comunidad* of the city in the same year and its consequences.

Although Enríquez disappeared from the political scene after Enrique IV's death in 1474, he was still alive in 1503, acting as a witness to a memorial concerning a dispute between the duke of Infantado and the marqués of Villena, and expressed the view that Álvaro de Luna had been a loyal and faithful servant to King Juan II.

ESCAVIAS, PEDRO DE

Castellan mayor (*alcaide*) of Andújar, Pedro de Escavias (ca. 1420–late 1490s) was identified by Juan de Mata Carriazo in his edition of *Hechos del condestable don Miguel Lucas de Iranzo* as the probable author of this chronicle about Enrique IV of Castile's favorite, Miguel Lucas de Iranzo. Mata Carriazo based his opinion on the internal evidence of the chronicle. He dis-

missed another possible candidate, Fernán Mexía, author of the *Nobiliario vero* (1492), on the grounds that the chronicle depicts him in a very poor light.

The chronicle is a priceless account of life on the frontier between Castile and Granada during the second half of the fifteenth century (ca. 1460–ca. 1471), a period characterized by alternating episodes of belligerence and remarkably tolerant episodes of *convivencia* (conviviality).

Miguel Lucas had voluntarily chosen exile from the royal court and in Jaén organized the town and its people in terms of Christian ideology (the feasts of the Christian calendar and problems of attack and defense on the frontier are remarkably recorded) and led a series of attacks on Muslim strong-holds along the frontier (described in panegyric terms). In Miguel Lucas's attacks on Granada, Pedro de Escavias is portrayed in the chronicle in a heroic light, very favorably. When, for example, Enrique IV (a worthless king, according to the account) wished to take Andújar, Escavias, replied in terms that totally debased royal power, addressing him as a king "if it is fitting to call someone king who is a slave."

The chronicle also records a *romance*, composed in honor of Miguel Lucas and his loyalty to the king. The spirit and the words probably express Escavias's own feelings rather than those of the former favorite of Enrique IV.

ESCOBAR, PEDRO DE

Born at Oporto (ca. 1469) and therefore also known as Pedro del Puerto (do Porto), Escobar, may have been introduced to Isabel of Castile by the bishop of Oporto, João de Azevedo. While singing in her chapel choir from 1489 to 1499, Pedro—identified as Portuguese in a Simancas document—collaborated with Juan de Anchieta and Francisco de Peñalosa in composing two Lady Masses, extant in the Tarazona cathedral choirbook (vol. 3). On 19 May 1507 the Seville cathedral chapter dispatched a messenger to Portugal with an invitation to "come take charge of the choirboys." During his seven years at Seville, Escobar endured financial problems that the chapter attempted to alleviate. On 13 August 1514 Pedro Fernández was named his successor. On his return to Portugal he was chapel master (*mestre da capela*) for Cardinal Alfonso (Manuel I's son), continuing in that post from no later than

1521 to 1535. In the latter year he was living in poor circumstances at Évora.

Gil Vicente alludes to Escobar in his *Cortes de Júpiter* (August 1521); in that year he led a band of *tiples*, *contras altas*, *tenores*, and *contrabaxas* who performed at a royal prenuptial celebration. He was survived by two daughters who continued to receive royal pensions in 1554.

Escobar's eighteen pieces with Spanish text in the *Cancionero musical de palacio* include three trios that also appear in the *Elvas cancionero* (Em 11973): "*Lo que es lo seguro*" (lyrics by Garci Sánchez de Badajoz, ca. 1460–ca.1526); "*Pásame por Dios varquero*"; and "*Secáronme los pesares*" (lyrics by Sánchez de Badajoz). His *Quedaos adios* (in *Cancionero*, fol. 95v) appears with sacred text in the twenty-four-leaf *Consueta* of 1709, the oldest source of Mystery of Elche music. His motet *Clamabat autem mulier Cananea* (four voices), the most famous of his smaller Latin works (seven motets, four antiphons, two alleluias, eight hymns), circulated as far as Guatemala, and in 1546 was intabulated for *vihuela* by Alonso Mudarra. João de Barros praised it as the "prince of motets" in his "*Libro das antiquidades*" (Lisbon, Biblioteca Nacional, 216).

ESPÁREC, ARCHBISHOP OF TARRAGONA

Espárec (also Aspareg, or Sparago) de la Barca, perhaps a native of Montpellier, where he studied law, entered ecclesiastical service in 1212 as bishop of Pamplona. He rose to prominence as a counselor of the royal family, and after the *cortes* of Lleida in 1215 he became archbishop of Tarragona, overseeing an ecclesiastical province, the *Tarraconensis*, largely coterminous with the Crown of Aragón's territory. In this

capacity he was named by Pope Honorius III as one of the four regents during the minority of King Jaime I, having previously negotiated the Confederation of Monzón that created an interim government. As an international statesman he intervened in disputes among the nobility on both sides of the Pyrenees, and in 1227, presided over the Tribunal of Alcalá, where he continued to delimit Fernando III of Castile's designs on the Crown of Aragón. For the papacy he investigated the dealings of Archbishop Rodrigo of Toledo. He helped young Jaime I get an annulment of his first marriage, and in contrast to his support for keeping of the internal peace, he promoted the crusade against Valencia.

In line with his papal service but his guarded stance against all external intervention, Espárec hosted the legation of Cardinal Jean of Abbeville but less enthusiastically promoted the post-Lateran reforms advocated by the legate. It was only under pressure that he called the reform Council of Lleida (1230), which only four suffragans attended, and followed it with another council in Tarragona. The legate's demand for the Tarragona chapter's reform and election of more canons for the care of souls was resisted by the chapter and not enforced by their archbishop. More positively, Espárec continued the repopulation of Tarragona; dedicated a parish church to St. Michael for the port district; initiated the use of the cathedral of Tarragona, which continued under construction; and after 1218 sponsored the Carthusians by founding Scala Dei monastery. In a further effort to incorporate into his diocese the Priorat, the mountainous region that had been the Muslim March of Ciurana and that continued to resist assimilation, he introduced the Inquisition from Provence. He died at Tarragona on 3 March 1233.

ESPINA, ALONSO (ALFONSO) DE

An Observant Franciscan, Espina preached sermons against the *conversos* (Jews who had converted to Christianity) and Muslims in towns such as Valladolid and Medina del Campo during the 1450s. Attached to the friaries of Valladolid and El Abrojo, he was by 1452 a regent of studies at the University of Salamanca and subsequently became confessor to Enrique IV of Castile (r. 1454–1474). However, given the opposed

views of the two men, it is doubtful that his role as confessor had any practical significance.

In 1461 Espina was one of the instigators of a Franciscan plan that demanded the setting up of an inquisition. Shortly afterward he was involved in a scandal in which another Observant Franciscan, Hernando de la Plaza, preached a sermon at the royal court alleging that the Observant Franciscans had in their possession the foreskins of circumcised New Christians, an allegation that Enrique IV quickly demonstrated was without foundation. Between 1458 and 1461 Espina wrote his *Fortalitium fidei contra iudeos, sarracenos et alios christianae fidei inimicos*, which constitutes his main claim to fame, if only because it provided a "blueprint" for the later Spanish Inquisition. Earlier he had written *Sermones de nomine Iesu*.

The *Fortalitium* consists of five books, four of which are directed against the enemies of the Catholic faith: Jews, heretics (meaning mainly Muslims), and demons. The importance of the treatise does not lie in its originality; indeed, Espina tended to copy from his sources word for word. What was important was that he produced a compendium of fictional stories and allegations from all over Europe, the end result being to emphasize a conspiracy against Christianity and the need for the inquisition. Clearly a fanatic, Espina had the knack of combining the wildest stories (for example, about host desecration, ritual murders, and incubi and succubi) with an apparently logical and theological approach designed to prove the existence of a Hebraic-Crypto-Judaic-Islamic-demonic threat to Christianity.

It has been alleged that Espina was himself a converso, but there is no firm evidence to support this. It has also been asserted that he was made a bishop in "partibus infidelium" about 1491; inquisitorial records, however, indicate that he died in Madrid toward the end of Enrique IV's reign.

Espina had alleged that leading nobles and churchmen at the royal court actively protected the Jews and conversos. Among other things he claimed that Jewish physicians deliberately poisoned Old Christians. When he himself fell ill, witnesses affirmed that the king's minister, Diego Arias Dávila, persuaded Enrique's Jewish physician, Maestre Samaya, to poison Espina. Thus on his deathbed Espina provided yet another example to bolster his conspiracy theory.

ESTADOS *See* ESTATES

ESTAMENTS *See* ESTATES

ESTATES

In the High and Late Middle Ages, European society was hierarchically organized and composed of three orders or estates (*estados, estaments*). This reflected the scholastic concern for categorization as a device for giving meaning and order to the social structure. It was also the result in part of the revival of the Roman legal concept of *status* or juridical condition. Reference to this condition (*estado de los homes*) appeared in Alfonso X's *Siete Partidas* in the sense that human beings were considered as free, slaves, or freed from slavery. In his *Planeta* (1218) the chancellor of Castile, Diego García, mentioned the threefold division of society—*oratores, cultores, defensores*—but it remained for the *Siete partidas* to elaborate the theme. The three estates established by God to maintain the world were the clergy (*oradores*), who prayed to God to protect his people; the nobles (*defensores*), whose characteristic function was warfare, theoretically in defense of the community; and the workers (*labradores*), who cultivated the fields or labored in the towns. Each person existed as a member of an estate, carrying out its characteristic duties and enjoying its distinctive juridical condition.

In his *Libro del caballero et del escudero*, Alfonso X's nephew, Infante Juan Manuel (1282–1347), declared that one could save one's soul in any of the three estates, because each one was good. Nevertheless, the highest estate was that of the clergy because of their sacramental function. The most honored estate among the laity was that of the nobles, "because the knights have to defend and do defend the others." While accepting the traditional division into three estates, Juan Manuel, in his *Libro de los estados*, divided society broadly into the two estates of clergy and laity. Just as the pope had the highest rank in the clerical estate, so the emperor ranked highest in the lay estate. The Catalan Francesch Eiximenis (1330/35–1409), in his *Regiment de prínceps*, offered a somewhat different tripartite division of society based on wealth and power. In his view the *maiors* included the aristocracy of birth and wealth, both lay and clerical. The *mitjans*

were the middle class of professional people and merchants, and the *menors* were the workers and peasants.

The king constituted an estate of his own (*estado del rey*), in which he was placed by God. It was an estate greater than all others, except that of the emperor. Taken together, the estates constituted the people of the realm, an assembly of all ranks of men. The king was obliged to love, honor, and guard his people, "each one in his estate." Together with "all the men of the realm," the king formed a single body of which "he was the head, the heart, and soul, and they were the members." This belief in the organic structure of society composed of three estates logically led to the notion that when the king assembled the estates in the *cortes*, the entire community of the realm was present before him and capable of acting as one legal person. The consent of the representatives of the estates was tantamount to the consent of all the men of the realm. Thus the meetings of the *cortes* gave the estates the opportunity to come together as one and to participate with the king in the determination of the public business.

ESTORIA DE ESPAÑA See ALFONSO X; ILLUMINATION

ESTÚÑIGA, LOPE DE

Born probably between 1406 and 1410, Estúñiga was a member of the powerful Estúñiga clan. The first recorded event of his life has his participation in Suero de Quiñones' *Paso honroso*, one of the great chivalric challenges of the time, at a bridge on the Obrigo River in 1434. Nothing more of him is known until 1439, when, defying Juan II and Don Alvaro de Luna, he aided his brothers and his father, Iñigo Ortiz de Estúñiga, in the takeover of the city of Valladolid. Subsequently jailed by both Don Alvaro and Enrique IV, Lope de Estúñiga was known for his impulsiveness and quick temper. His fickle disposition involved him in numerous scandals throughout his life, most notably in 1462 when his wife fled home to seek refuge from him in the convent of Santo Domingo el Real in Toledo. Knocking down the doors of the convent, Lope compelled her to return home and promised not to ill treat her. The last years of his life were spent in Toledo, where he died between 1477 and 1480.

Lope de Estúñiga is best known as a poet and for the important collection of *cancionero* verse that bears his name. His poetic personality stands out from among the many *cancionero* poets of the fifteenth century for its lyrical intensity and subtlety.

ETYMOLOGIAE See ISIDORE OF SEVILLE

EUGENE I, BISHOP OF TOLEDO

The little that is known about Eugene I comes almost exclusively from the paragraph dedicated to him in St. Ildefonso's *De viris illustribus*. Eugene was a monk until drafted by Bishop Helladius (615–633) to assist in running the Toledan see. He served as *collector* under Helladius's successor, Justus (633–636), and succeeded Justus as bishop (636–646), attending the fifth (636) and sixth (638) councils of Toledo. According to Ildefonso, Eugene was an expert in astronomy. In a letter to Braulio of Zaragoza, his successor, Eugene II, referred to an episode in which Eugene I, obliged by the king to promote a man he regarded as an unworthy candidate to the priesthood, sabotaged the ordination by administering a curse rather than a blessing.

EUGENE II, BISHOP OF TOLEDO

A native of Toledo, Eugene served as a cleric there prior to entering a monastery in Zaragoza. In 631, when Braulio succeeded his brother John as bishop of Zaragoza, he appointed Eugene archdeacon of the Church of San Vicente. Braulio apparently intended for Eugene to succeed him, but when Bishop Eugene I of Toledo died in 646, King Chindaswinth chose the younger Eugene to succeed him. As the metropolitan

of Toledo, Eugene attended the Toledan councils of 646, 653, 655, and 656. He died in 657.

With the exception of letters to Braulio, Chindaswinth, and Bishop Protasio of Tarragona, Eugene's prose works, which included a treatise on the Trinity, have not survived. His efforts in verse have fared better. He revised the first book of the *Laudes Dei*, written by the late fifth-century Carthaginian poet Dracontius, as well as the *Satisfacio* that Dracontius addressed to the Vandal king who had arrested him. Eugene also composed over one hundred short poems that influenced subsequent Spanish poets, including Pablo Álvaro of Córdoba. According to Ildefonso, who succeeded him, Eugene was responsible for composing hymns and revising the Visigothic liturgy.

EULOGIUS OF CÓRDOBA

Priest and apologist for the Martyrs of Córdoba who died in 859 Eulogius was born (c. 800) into a noble Christian family in Córdoba. His parents dedicated him as a child to the Church of St. Zoylus, where he was educated and trained for the priesthood by the abbot Speraindeo. There he met and befriended Paulus Alvarus, later the author of the *Vita Eulogii*, upon which much modern knowledge of Eulogius is based. After his ordination Eulogius seems to have replaced Speraindeo as the *magister* responsible for training future priests. Around 849 or 850 Eulogius traveled north, visiting Navarrese monasteries and acquiring books.

Shortly after Eulogius's return, a monk named Isaac was arrested by the Muslim authorities for blaspheming Islam and was executed on 3 June 851. Within two months ten more Christians followed Isaac's example, launching what has come to be known as the Córdoba Martyrs' Movement. Sometime during that summer Eulogius took it upon himself to begin composing the *Memoriale sanctorum*, a martyrology containing brief accounts of the passions of the executed Christians. Shortly thereafter the Muslim authorities, looking for a way to stem the growing tide of dissent, ordered the arrest of the Córdoba clergy. Among those incarcerated was Eulogius. During his

detention he continued to work on the *Memoriale sanctorum*, to which he added a preface designed to convince skeptical members of the Córdoba Christian community that the executed Christians were indeed legitimate martyrs who had suffered as the result of actual persecution. He also wrote the *Documentum martyriale*, a hortative treatise designed to encourage Flora and Maria, who had been arrested for apostasy and blasphemy, respectively, to maintain their resolve to become martyrs.

Eulogius was released in late November 851, but his relations with the local authorities, both Muslim and Christian, became increasingly strained. At one point he contemplated suspending himself from celebrating Mass in order to dramatize his dissatisfaction with the Church authorities who seemed intent on working with the emir to bring the martyrdoms to an end. The unpopularity of Eulogius's position seems to have prevented him from accepting his nomination to succeed Wistremirus as metropolitan of Toledo in early 852. That summer he had to hide to avoid being arrested a second time and was subsequently denounced at an episcopal council that had been convened by the emir to deal with the problem of the martyrs. Little is known about Eulogius's life over the next five years except that he continued to add to the *Memoriale sanctorum* as the executions continued. Sometime after March 857 he wrote another martyrology, the *Liber apologeticus martyrum*, dedicated to Rudericus and Salomon, who were put to death as apostate Muslims at that time. It also is known, from an independent source, that in 858 Eulogius met with the monks Usuard and Odilard, who had come from Paris to Zaragoza in search of relics and had been referred to Córdoba. In the late winter of 859 Eulogius was arrested for harboring a fugitive apostate named Leocritia. He defended himself by claiming that as a priest he was bound to instruct anyone seeking knowledge of the faith. When the judge ordered him whipped, Eulogius responded by denouncing Islam and was executed for blasphemy on 11 March 859.

Most assume that Eulogius's role vis-à-vis the martyrdoms was that of an orchestrator of a martyrs' movement. Yet a close look at the sources reveals that he had personal contact with only a few of the martyrs. His self-appointed function seems instead to have been one of promoting their cult when many of the Córdoba Christians seemed inclined to reject the would-be martyrs as suicides whose actions jeopardized their day-to-day relations with the Muslims. To this end Eulogius struggled in his writings to cast the Muslims as persecutors of the ancient Roman type and to portray Islam as a diabolically inspired false prophecy. Eulogius's apologetic treatises are important, then, not only as evidence of the wide spectrum of Christian re-

sponses to life under Muslim rule—from outright rejection to almost complete assimilation—but also as one of the earliest extant sources for Western views of Islam.

EXEMPLA

The classic view on the genre of exempla continues to be the one described by Welter. This entry considers the importance of the compilations of exempla collected by French and English mendicants in the thirteenth and fourteenth centuries, as well as the various ways of organizing the material. The period coincides with the reformist stimulus of the Fourth Lateran Council (1215), when the new religious orders, especially the Franciscans and Dominicans, made wide use of exempla in preaching. That use is reflected both in the considerable extension of the exempla sources and in the appearance of compilations of doctrinal exempla. Parables, miracles, Eastern short stories, descriptions of tales related to animals, and many more—with some modifications—enlarged the preachers' compendia. Although the effects of the Lateran Council were not immediate, the great compilations that appeared in France and England are widely represented in the Spanish libraries, and a clear reflection of this circulation was the late appearance of the Romance books of examples.

In the same codex the *Libro de los gatos* and the *Libro de los exenplos por a.b.c.* by Clemente Sánchez de Vercial are copied. The first is a version of the *Fabulae* by Odo of Cheriton (1180–1190), written by the middle of the fourteenth century. Between the Latin original and the Romance version there is not an important lapse of time but there are a number of modifications. The first of them, and the only one that has concerned the critics, is the mysterious title, for which there are no explanations in the original.

The reduction in the number of tales (from seventy-five to fifty-eight) may be due to a mistransmission because, except for some isolated cases, the absences are concentrated at the beginning and at the end. Under every heading there is a story and the moral that can be taken from it. The stories range from those

with a minimum narrative to folk tales or tales related to animals. The moral is usually addressed to important churchmen and laymen, criticizing the numerous social problems existing in Castile in the fourteenth century.

The *Libro de los exenplos por a.b.c.*, in two manuscripts, is the only Spanish book of doctrinal exempla considered to be original. Its author, the archdeacon of Valderas (León), wrote it in the first third of the fifteenth century, following a strict alphabetical order (from *Abbas* to *Ypocritas*), in the same way the Franciscans had done in their collections. It includes 438 headings with up to 547 examples each. Although its disposition may indicate a sermonlike use, the brief preface reveals the desire to teach readers. Study of the text shows several differences from the most representative works in that genre: in the selection of sources there are plenty of examples from Valerius Maximus, and there are hardly any stories whose main characters belong to the mendicant orders; every example is preceded by a Latin *addagio* followed by its versified translation, forming a unit that recalls the scholarly apparatus of the quotation and its gloss. Finally, the examples, thought of being read directly without the oral support of preaching, are more developed in comparison with the Latin records. By the middle of the fifteenth century, the Spanish version of the *Speculum* (from the end of the thirteenth century and produced by an English Franciscan) had been produced. The translation, known as *Espéculo de los legos*, faithfully follows the Latin original and could also have been used, as shown in the manuscript, as pleasant reading in the conventual environment.

Manuscript 5626, in the National Library of Madrid, has an incomplete version of a book of doctrinal examples that, given its close relationship with the work by Vincent of Beauvais, may have come from a Dominican convent.

EXPLORATIONS, CASTILIAN

The literature of antiquity was filled with references to islands in the western sea, the so-called Blessed or Fortunate Isles. Pliny speaks of them, evoking their climatic diversity. The description he gives of one of them, Nivaria, could well be taken for Tenerife, one of the largest of the Canary Islands, with its snow-

capped peak rising out of the ocean. Their mention is repeated in Solinus and Isidore of Seville, both of whom served as key intermediaries for the transmission of classical knowledge to the medieval world. Throughout the Middle Ages, mention of islands in the western ocean continued to surface in vague evocations. It is not until the 1337, however, that a reasonably accurate allusion to them appears in Petrarch, who notes that Genoese ships had been sailing to them within the memory of his parents.

Although the chronology of the mapping and exploration of the archipelago of the eastern Atlantic, known as the Canary Islands during the Middle Ages, cannot be reconstructed with any certainty, it was already well underway before the 1330s, according to reliable information. The name Canary Isles, current from the 1340s, reflect a debt to Pliny, who had named one of the Fortunate Isles Canaria. The first authenticated visit to them, probably prior to 1339, is attributed to Lanzarotto Malocello, a Genoese who likely sailed under Portuguese patronage. By 1341 there is detailed information, apparently in Boccaccio's hand, of an expedition that was the product of cooperation between Portuguese and Italians and included Castilian personnel. News of the expedition quickly spread in Seville and Mallorca, and at least four voyages were licensed from the latter place to the Canaries in 1342. In 1345, Alfonso XI of Castile, invoking his rights to the conquest of "all the kingdoms of Africa" based on remote Visigothic precedents, laid claim to the Islands. Exploration and colonization, however, suffered a setback with the advent of the plague in 1348, although there is record of a voyage by Joan Doria and Jaume Segarra from 1351. Another reference from 1366 preserves instructions from the king of Aragón to patrol the archipelago and exclude interlopers. Many of the early reliable mentions of the Canaries also display a knowledge of the Azores further west. In the 1370s, according to tradition, the Canaries served as a theater of war between Portugal and Castile.

It was not until the 1390s, however, that a move to prosecute Castilian rights to the Canaries had begun in earnest. In 1390 Gonzalo Pérez de Martel sought royal permission in Seville for conquest but, according to later references, Enrique III in that year had already granted a license to Fernán Peraza. Peraza joined his interests in 1393 to those of the Conde de Niebla and mounted an expedition manned by Basque and Andalusian mariners that left destruction in its wake. They seized many natives, the so-called Guanches, including a local chief and his wife, and reported back on how easy their conquest had been. From this time forward, despite efforts by the French (Jean de Béthencourt, who held Lanzarote and Fuerteventura for a time) and

the Genoese to make incursions there, the Canaries remained under Castilian authority. By the time of the first surviving records from the islands in the mid-fifteenth century, the institutions and the language of the Canary Islands were thoroughly Castilian, and there was a well-established colony of settlers there. The conquest of the islands had been rationalized by the Conde de Niebla and Enrique III in terms of "converting the natives" to Christianity. However, the rights of the pagans to remain undisturbed became an issue of debate. Until their final subjugation in the 1470s, accounted for by Castile in terms of a crusade, many of the native populations of the islands would continue to mount insurgencies and show resistance. The economy of the islands was largely geared to slaving along the African coast and some agriculture, especially on Gran Canaria. Agricultural products included leather and suet as well as native products like orchil, a mosslike substance gathered from rocks used for medicinal purposes. Pastoralism and gathering were features that survived well into the colonial period.

The final completion of the Castilian conquest and pacification of the all the native inhabitants of the Canary Islands in the 1470s would serve as an important prelude for the Castilian enterprise in the New World. By the late fifteenth century, the Canaries would become crucial stopovers in the exploration of the western Atlantic and America. Columbus knew the Canary Islands well.

In 1485, shortly after the pacification of the Canaries, Columbus went from Portugal to Castile, where he would spend nearly seven years attempting to secure the patronage of the crown. He was received at court, given a small annuity, and quickly gained both friends and enemies. An apparent final refusal in 1492 nearly sent Columbus to France, but a last appeal to Queen Isabel proved successful. An agreement between the crown and Columbus set the terms for an expedition to search for a western route to China and the east.

In the summer of 1492, Columbus outfitted three ships at the port of Palos. He was assisted in his efforts by two men—Martín Alonso Pinzón, and his younger brother Vicente Yáñez Pinzón. They left Palos on 3 August 1492, stopped in the Canaries, and sailed west with favorable winds. A landfall was made on the morning of 12 October 1492, at an island in the Bahamas, which Columbus named San Salvador and claimed for the Crown of Castile. Historians have identified it as present-day Watling Island, although Samana Cay, 105 kilometers to the south, has also been named as a candidate.

The landing was met by a friendly local population that Columbus called *Indianos*, thinking they were the

native inhabitants of the East Indies. Some days later the expedition sailed on to present-day Cuba, where delegations were landed to seek the court of the Mongol emperor of China and gold. In December they sailed east to La Española (Hispaniola), where one of the ships was wrecked near Cap-Haitien, though the entire crew was saved. Thirty-nine men were left on the island at the settlement of Navidad while Columbus returned to Spain, sailing due north before heading east again to find favorable winds. He landed at Lisbon in March 1493 and was interviewed by the Portuguese king, João II. He then left for Barcelona, where he was welcomed by the Catholic Monarchs. Columbus claimed to have reached the islands just off the coast of Asia and brought with him artifacts, Indians, and gold. Over the course of the next fourteen years, Columbus mounted four expeditions to the New World under Castilian patronage.

Portuguese claims to the Castilian discoveries in the western ocean led Pope Alexander VI to issue bulls in 1493 that divided the world into areas open to colonization by Castile and Portugal. The two nations moved the line of demarcation to 370 leagues west of the Cape Verde Islands, according to the Treaty of Tordesillas (1494), and began exploration and colonization. By the time of Columbus's final return to Castile from his fourth voyage in November 1504, his efforts had brought large portions of America under the jurisdiction of the Castilian crown, which during the sixteenth century under its Habsburg successors would patronize its exploration and colonization.

EXPLORATIONS, PORTUGUESE

Portuguese explorations rest on an Italian base because from the time of King Dinis (r. 1279–1325) until the reign of João I (1385–1433), it was the Genoese mariners and Mallorcan chartmakers in (or associated with) Portuguese royal service who laid the foundations for what was to come, while on the Portuguese side, the growing interest in maritime reconnaissance arose from Lisbon's position as the "wharf between two seas" added to a growing trade with the north in salt,

Fleet of Vasco of da Gama. From a manuscript depicting the Lives of the Portuguese Viceroys and Governors in India, by Lizuarte de Abreu, Portugal, ca. 1558. M.525f, 18–19. Copyright © The Pierpont Morgan Library/Art Resource, NY The Pierpont Morgan Library, New York, N.Y., U.S.A.

wine, and local agricultural products. Early Italians in royal service, included Manuel Pessagno and his kinsman Lanzarotto Malocello, both of whom were appointed admirals and became naturalized subjects, they not only created the first Portuguese royal fleets, but also with them visited the Canary Islands and probably discovered the Azores during the course of the fourteenth century. These islands were first represented by Italian portolan makers both in Italy and on the island of Mallorca.

But in the fifteenth century, from the reign of João I, it was the native Portuguese who assumed and continued maritime discovery. Beginning in the 1420s, Infante Henrique, who had become governor of the Algarve, obtained, first from his brother Duarte and, after his death in 1438, from the young king Afonso V, proprietorship of the Madeira Islands, the Canaries (which Portugal later lost to Spain), and the Azores, as well as the exclusive right to license all voyages along the African coast. After Henrique's death in 1460, there followed a six-year period (1469–1475) when the crown granted African voyaging and exploitation rights to the concessionaire Fernão Gomes, but in 1474 Afonso's son, the infante João (later João II), requested and received the rights his uncle had enjoyed. After the Gomes contract expired, pursuit of further discoveries became exclusively a royal prerogative once again.

Although foreigners were frequently enlisted, Portuguese reconnaissance was kept tightly in royal hands: with only Gomes excepted, Infante Henrique and/or the crown sought to license all voyages southward along the coast of Africa and to exclude interlopers;

in this it gained the help of the papacy, for beginning in 1455 Rome added its authority with a series of bulls. The first was the *Romanus Pontifex* of Pope Nicholas V, prohibiting all travel or trade south of Cape Bojador without express Portuguese license.

The pattern of exploration in the fifteenth century began soon after the conquest of Ceuta in 1415; the first islands to be (re)discovered were the Madeiras (1419) and the Azores (from 1427 on). The Canaries areas case apart; they were known from classical times, but Portuguese claims to them were countered by Castilian ones and Portugal finally was forced to abandon them after dismal failure of the military expedition of 1479 intended to counter the accession of Isabel I. The last island group to be discovered was the Cape Verdes (1455), by a Venetian in the service of Henrique, Al-vise Ca'da Mosto.

The newly discovered islands (save for the Canaries) were uninhabited, and later were colonized from Europe and Africa; their patterns of settlement were established in contracts between Prince Henrique and the discoverer/proprietors; these, incidentally, became the models after 1500 for the settlement of Brazil. Rather than discovery among the islands, however, it was exploration of the African coast that was most portentous, because it eventually brought the Portuguese flag to the Indian Ocean. Until recently Prince Henrique had been given exclusive credit for the sending of vessels eastward, and even given the posthumous honorific "the Navigator," no doubt due to the panegyric chronicle written by Zurara, one of his retainers, who represented him as a studious visionary overwhelmed by geographical curiosity and the desire to spread the faith. Research has corrected this image: He inaugurated less than half of the coastal voyages and appears to have been far more of a businessman, investing in virtually every contemporary enterprise on land or sea. Nonetheless, at his death in 1460, Portuguese vessels had sailed as far south as Serra Leão (Sierra Leone). Historians have demonstrated the extreme unlikelihood that Prince Henry could specifically have had the Indian subcontinent in mind when inaugurating his voyages, for in that era its separate existence in the European mind had hardly been established; rather, the expression "Indies" was a catchall for any lands including and east of Turkey and Palestine. Henry was merely looking for the legendary Prester John, whose definite abode had not yet been established within this vague eastern expanse.

It was Henrique's nephew, Infante João II, who succeeded to the throne in 1481, who set Portugal's sights on India; in effect he virtually presented it to his successor as all but a fait accompli. João had peti-

tioned and received the rights of his deceased uncle in 1474, and upon his accession in 1481, he lost no time in resuming Portuguese reconnaissance on a scale hitherto unknown. One of his first steps was to obtain permission to build a fort at Elmina (São Jorge da Mina) on the Guinea coast; cargo ships brought prefabricated stones from Portugal, and a fortress was quickly erected there. It was then used as starting point for further explorations. Among these were the two or three voyages of Diogo Cão resulting in the discovery of the Congo River (1482) and the Cape of Good Hope (1488) by Cão's successor, Bartolomeu Dias. At the same time, in hopes of making contact with Prester John and the source of the spice trade in India (which by then had been identified), João II dispatched overland expeditions from Lisbon and from Elmina; the ones sent across Africa were lost, but one of the two men sent from Lisbon, Pero da Covilha, actually visited India in 1492, whereupon he doubled back to Ethiopia to complete the assignment of his deceased companion, Afonso de Paiva.

The Portuguese medievalist Luis Adão da Fonseca has argued convincingly that after the finding of the Cape of Good Hope, João sent other expeditions into the Atlantic, perhaps seeking a practicable route that square-rigged vessels could follow to round Africa. It is not known when he conceived the idea of reaching the Malabar Coast of India and trading there, but his goal is inherent in all of these activities. So little detail is known, with certainty, however, of João's expeditions after discovery of the Cape of Good Hope that the late Portuguese historian Jaime Cortesão argued that our ignorance is due to a strict policy of *sigilo* (secrecy), pursued by João to keep his discoveries from his Spanish rivals. But this thesis has been attacked by subsequent historians and generally rejected. It is just as likely that either the documents were lost in the great earthquake of 1755 or that the rival factions, the Braganças and their allies, who succeeded to the throne upon João's death in 1495, destroyed them in reprisal for the harsh punishment João had meted out to family members who had plotted against him. At any rate there is fair circumstantial evidence that João's navigators had some idea of lands to the west; otherwise, how would he have known to claim Brazil at Tordesillas, after Columbus's return in 1493? (The context of his actions, however, would point to his lack of interest in uncivilized western lands when India was within reach; it would seem he simply did not wish loss to Castile of any such lands for which his navigators might have established prior claims.)

There is evidence that after Dias's discovery of the Cape of Good Hope, João sent one or more expeditions up the African coast as far as Mozambique and

Socotra, but that these were wrecked—information that the new king, Manuel I, apparently did not wish to make known because it would detract from his own prestige. (It is contained in Damião de Gois's *Crónica de D. Manuel* and in two Arab sources.) At any rate, in 1498 Vasco da Gama, sent by Manuel, reached Calicut and inaugurated the sea route used to establish a Portuguese presence in India. In 1500, on the second trip to Calicut, the expedition under Pedro Álvares Cabral sailed close to the bulge of Brazil and proclaimed its discovery, though it is possible (because it lay so close to the sailing routes to the Cape of Good Hope) that previous Portuguese reconnaissance had sighted it.

With two possible exceptions, there was no Portuguese discovery thereafter, perhaps because the Asians were expert navigators and their pilots were available to guide the Portuguese wherever they wished to go. In addition the crown, perhaps as a consequence, had ceased to sponsor exploration as it had before. But in or about 1543, three Portuguese freelance traders were blown ashore at Tanegashima, in southern Japan (thereby, one could conceivably argue, discovering it). And, of course, there was a Portuguese captain, one Fernão de Magalhães (also called Magellan) who in 1521 sailed across the Pacific under the Castilian flag because he believed he had been unjustly treated by his own crown in a dispute over spoils from Morocco.

EYMERICH, NICOLAU

Nicolau Eymerich, who in 1376 wrote a standard work on heresy and the procedures of the Inquisition, was born at Girona about 1320. Fourteen years later he became a novice in the Dominican convent of his na-

tive city. His theological, philosophical, and legal studies quickly led to preaching and writing, and in 1357 he was appointed inquisitor-general for the Crown of Aragón (including Catalonia, Aragón, Valencia, and Mallorca), a post he was to hold, with some interruptions, until his death on 4 January 1399

Eymerich produced a wide range of theological works, including commentaries on the gospels of Mark and John, and a treatise on the divine and human natures of Jesus. His most famous work is his *Directorium inquisitorum*, which not only guided the papal Inquisition in the Aragón of his own day, but also survived as a manual for the refounded Spanish Inquisition of Fernando and Isabel's reign. In the enlarged edition of Francisco Peaña (1578), it became a standard text of the Roman Inquisition during the Counter-Reformation.

During his lifetime Eymerich greatly offended his sovereigns, Pedro IV and Juan I, by upholding the rights of the Inquisition, and by attacking the writings of Ramón Llull and pursuing Llull's, followers both personally and in print. During his two resulting periods of enforced exile from Aragónese domains (1377–1387, 1393–1397), he was attached to the Avignonese popes Gregory XI, Clement VII, and Benedict XIII during the Great Schism of the Catholic Church.

Whatever the violent consequences that were to result from his written and practical work, Eymerich is justly recognized for the knowledge and discrimination shown in his inquisitorial manual. He went beyond the then conventional repetition of laws, previous sentences, and descriptions of heretical views and practices, in an attempt to enter the mind of the "heretic." His fame is thus based on his *Directorium*, rather than his role in the political and ecclesiastical events of his day.

F

FADRIQUE, DUKE OF BENAVENTE

The illegitimate son of Enrique of Trastámara, Fadrique was appointed to the Admiralty of Castile by his father. He married an illegitimate daughter of King Fernando I of Portugal and received the title of Count-Duke of Benavente. He attempted to play an important role in Castilian affairs of the last decades of the fourteenth century, but in the long run his efforts failed. As a result of unsuccessful political machinations, he was deprived of his title in 1394.

As half brother of King Juan I of Castile, Fadrique was sent to Gascony as surety when, in 1388, the Castilians negotiated a settlement with the duke of Lancaster that ended the English claim to the Crown of Castile. Aside from a monetary settlement to be paid the English, the Castilians agreed to the marriage of the heir to the throne, the future Enrique III, to Lancaster's daughter Catherine. Following the wedding, and the payment of the agreed-upon sum, Fadrique was allowed to return to Castile.

Juan I died in 1390, leaving an eleven-year old heir in the care of a regency council sharply divided and unable to govern. Fadrique was one of the most prominent members of the faction within the council that represented the interests of the upper echelons of the aristocracy, at the expense of the crown and the lower aristocracy. The near chaos of this period came to an end when Enrique, though not yet fourteen, was declared old enough to assume the duties of the crown in 1393. He vigorously pursued his opponents, forcing Fadrique, his cause defeated, to capitulate in 1394. He was dispossessed of his titles and some of his properties. A month following the capitulation, Fadrique was taken prisoner and remained thus for the rest of his life. He died in 1404. The resolution of this episode—the apparent victory of the lower aristocracy, and the crown, over the upper aristocracy—constitutes a unique episode in the history of Castile.

FADRIQUE, MASTER OF SANTIAGO

With his twin brother Enrique de Trastámara, Fadrique was the first surviving child of Alfonso XI of Castile and his mistress Leonor de Guzmán. Favored and privileged from his birth in 1332, Fadrique and the rest of his seven surviving siblings, lived close to the king, receiving honors and titles at the expense of the king's legitimate family. While he was still a child, Fadrique was elected master of the Military Order of Santiago at the insistence of his father. Until his violent death on 29 May 1358, Fadrique's political position lacked the single-minded consistency of his brother Enrique.

On a number of occasions Fadrique fought against his half brother Pedro; in 1350 he refused to pay homage to newly crowned Pedro and fled to the lands of the Order of Santiago. In 1354 he joined the growing rebellion in Castile over Pedro's mistreatment of his wife, Blanche of Bourbon. In a complicated series of events that resulted from this episode, he and his brother Enrique fought against Pedro at Toro, Toledo, and Talavera. In spite of early reverses, Pedro was able to prevail; Enrique left the country, and Fadrique sought a pardon and a reconciliation. Two years later he was Pedro's ally in the early stages of Castile's war with Aragón, making available the considerable military resources of the order of Santiago for Pedro's expansionist projects, in spite of efforts by the Aragónese to recruit him to their side.

Enrique, on the other hand, signed a pact with Pere IV of Aragón, Pedro's enemy. Fadrique, savoring a recent military success at the fortress of Jumilla, was summoned to Seville by Pedro in May 1358. When he arrived at the palace, unsuspecting, two mace-wielding guards set upon him and hit him in the head. Pedro was in the next room; finding Fadrique still alive, the

king handed a servant a dagger to deliver the coup de grâce.

The fratricide, like several other obscure episodes in the reign of Pedro I, inspired the popular imagination. The *Romancero del rey don Pedro* has preserved two popular versions of the event. In one Pedro ordered Fadrique's death because the Master had had an affair, and a child, with Blanche of Bourbon, Pedro's French wife. In the other the blame falls on Pedro's mistress, María de Padilla, who asked for Fadrique's head as a prize.

FÁFILA, KING OF ASTURIAS

The only known son of Pelayo, the first king of Asturias, Fáfila succeeded his father in 737. He was killed by a bear, probably while hunting, in 739, and the throne in consequence passed to his brother-in-law Alfonso I. During his brief reign Fáfila is reported to have built a church dedicated to the Holy Cross at Cangas de Onís. No traces of it survive other than an inscription, which dates the dedication to Sunday, 27 October 737. This also provides the only evidence for the name of Fáfila's wife, Froiliuba.

FAIRS AND COMMERCE

Fairs, or *nundinae*, trace their origins to Roman times. As distinguished from the regional weekly market day, fairs in the Middle Ages took place once each year over a period of several days. In Iberia, fairs were held regularly at certain places and during certain times of the year, usually on religious feast days. Fairs, more than anything else, were wholesale markets geared to an economy that until the rise of the cities in the Late Middle Ages did not support the existence of daily retail markets. The size of fairs varied from place to place and ranged from a small gathering of merchants and displays to large community efforts guaranteed by royal privileges that offered housing and display spaces for visiting merchants. Revenue in the form of taxes was an important element of all fairs. Displays

and shops were taxed, and tolls were often charged on merchants making their way to fairs. Sales taxes, however, could be set aside for the duration of some fairs, which served as an important incentive for attracting local clientele and stimulating consumption of, especially, manufactured goods.

The basic necessities of life were generally available in the villages, estates, and monasteries of medieval Iberia. Luxuries, some raw materials and manufactured goods in particular, however, could only be obtained in the regional *ferias*. From the middle decades of the twelfth century on there was also an increasing commercialization of agricultural products—particularly wool—that were traded at a multiplicity of newly established fairs that became the focal points of increasingly commercial contacts with European industrial centers, particularly those of France, Flanders, Italy, and England, where raw wool was in high demand. In the late Middle Ages fairs became central to advancing widespread trade and commerce and were planned for and anticipated well in advance of their date. The fairs at such places as Medina del Campo and Talavera de la Reina, both close to the geographic center of the Iberian Peninsula, were particularly important because of their strategic location. To ensure their success, the roads leading to them were patrolled to guarantee the safety of all who sought to participate—Christians, Muslims, and Jews. In this way, too, fairs provided secure environments for the commercial interaction of Christians, Jews, and Muslims and offered an open, multicultural climate that incorporated people from as far away as France, Italy, Flanders, and the extreme ends of the Mediterranean. The merchants who gathered at the fairs in medieval Iberia were all of diverse provenance, many of them often of distant foreign origin, like the Genoese at Seville. Still others were Muslims and Jews from all parts of Iberia, especially from across the frontier, and the rest of the Mediterranean world. All of them were multilingual and traveled regularly to North Africa, Egypt, and even had dealings with agents as far away as Persia, India, and on into China.

All manner of items could be purchased or traded at fairs. Everything from agricultural tools (plows, rakes, spades, etc.), weapons, and other iron implements to woolens, rich brocades from Italy, and woven silk from al-Andalus was available and could be bought in small or large quantities. Furs made their way from as far away as Russia, while garments from locally produced leathers and skins were also available—especially items manufactured from sheepskin. Iberian wool from merino sheep was especially prized by foreign merchants and was traded for dried fish, linen, and spun cloth from Flanders and other parts of

northern Europe. Spices, salt, pepper, and honey (used for sweetening before the introduction of sugar from the Muslim south), were in great demand and could bring large profits. Cosmetics and perfumes became important commercial items at fairs from the thirteenth century on. Paper, manuscript books, ink, and other writing implements could also be purchased and sold.

In addition to trade and commerce, fairs became important centers in the rise of international banking. They were sites for the exchange, negotiation, and repayment of debt in international commerce, particularly in the cloth trade. They served as clearinghouses for contracts and for other international and commercial business deals.

Fairs filled an important economic need in the Middle Ages, yet they were also common meeting places that served for the communication of ideas, the dissemination of new technologies, and the introduction of new commercial and artesanal techniques of every kind. Physicians, alchemists, and astronomers could be found at fairs, and, as social centers, fairs were also gathering places for musicians, poets, and entertainers of every stripe.

The first fairs in medieval Christian Spain were apparently established in the reign of Alfonso VII of Castile, in Valladolid (1152) and Sahagún (1153). In the latter year, Ramón Berenguer IV appears to have established the first fair in Catalonia, in Moyá. In 1207 Pedro I of Aragón-Catalonia established a fair for the town of Colliure, granting also that all "external Jewish persons" are free to come to it and may travel freely by land or sea. It is peculiar that Jaime I, particularly given his establishment of "king's peace" laws, seems to have shown no interest in establishing fairs. Nevertheless, the *fueros* (municipal charters) of Aragón, compiled during his reign, do refer to the obligation of all citizens to "protect" the fairs and markets. Still, references to specific fairs are virtually lacking for the entire kingdom, including Valencia and Mallorca, throughout the medieval period. This may be due to the frequent wars, and also to the fact that the kingdom tended to develop more along industrial lines (particularly cloth manufacture). Whatever the explanation, the fact remains that merchants had to travel to far-off fairs in Castile, often at great risk of capture and death.

In Castile, early fairs, in addition to those mentioned, were established at Belorado, San Zoilo de Carrión, Sepúlveda, Cuenca and Alcalá de Henares. In the thirteenth century there were added those of Benavente, Brihuega, Cáceres, Badajoz, Mérida, Montiel, Alcázar, Sevilla, Cádiz, Murcia, and Lorca.

Alfonso X was particularly concerned with stimulating the economy through the establishment of fairs such as those of Seville (1254), to be held twice a

year—one for a period of fifteen days before and fifteen days after Pentecost (usually in May), and the second for a similar period before and after the feast of St. Michael (September 29). Safe conduct was granted to all—Christians, Muslims and Jews—who came to participate. An almost identical privilege was granted for the establishment of a fair at Baeza in the *fuero* granted by Alfonso. In 1266, shortly after the restoration of Murcia to Castile, Alfonso established an annual fair of fifteen days after the feast of St. Michael, and in 1270 a similar grant was made to Lorca.

During the reign of Sancho IV the fairs of Brihuega and Alcalá de Henares appear to have been established, since in 1293 Gonzalo, the archbishop of Toledo leased to some Jews his rights and income from these fairs, held twice a year. The fair of Alcalá, seems to have been in existence from much earlier since in 1282 a Christian merchant of Narbonne complained to Pedro III of Aragón that his goods at that fair had been seized by his order on a false pretext. In 1296, as a reward for the loyalty of Palencia, Fernando IV established a fair in that city.

Little is known of fairs in the thirteenth and early fourteenth centuries. One of greatest importance, established by Fernando de Antequera (ca. 1412), was the one at Medina del Campo, because of its central location and its ability to attract Portuguese and Italian merchants.

In 1459 Enrique IV granted a special privilege to Segovia to establish two fairs, and later confirmed the grants to all fairs except those of Segovia and Toledo, and at the *cortes* (parliament) of 1473 he finally reestablished those of Medina del Campo, Valladolid, and others. In 1491 Fernando and Isabel made that of Medina del Campo the general fair for the entire kingdom.

The importance of the fairs, in addition to the obvious stimulation of local economy of the host cities, was that they allowed not only people from the entire peninsula to mingle freely and sell and buy merchandise (with all that implies for cultural exchange and dissemination) but also encouraged foreign merchants and visitors. The guarantee of safety for all encouraged and further promoted the concept of cultural exchange.

While fairs as an economic and social phenomenon persisted well beyond the Middle Ages, their period of maximum influence and energy was from the late fourteenth through the fifteenth centuries in medieval Iberia.

FALCONRY See HUNTING

FAZIENDA DE ULTRAMAR, LA

La Fazienda de Ultramar (MS 1997, Universidad de Salamanca) was first published in 1965, by Moshe Lazar, who believed it might originate as early as the second quarter of the 12th Century. The manuscript, however, appears to date from the first third of the thirteenth century. In any event, this is one of the oldest extant works in Castilian literature.

The work is preceded by two short letters. In the first, Remont, Archbishop of Toledo, asks his old friend Almerich, Archdeacon of Antioch, to send him an account of the Holy Land, including the Latin and Hebrew names of cities and places, the distance between cities, and the miracles that Christ performed in Jerusalem and in all the Holy Land. In the second letter, Almerich promises Remont to learn everything as well as he can by studying the Latin and Hebrew scriptures. The body of the work is a synopsis of the Bible, organized both chronologically and geographically. The account begins in Hebron with Adam and Eve, proceeds through time and space and returns to Hebron, after Samson. The work ends with a number of prophecies about the coming of the Messiah. Although the narrative follows the events of the Old Testament, there are many references to the New Testament. This is done by projecting history over geography, that is to say, by examining the many layers of history that cover each geographical location. For example, when talking about the city of Tyre, a number of Christ's miracles are mentioned, as well as the fact that the city had an archbishop and many martyrs, was attacked by Alexander and Bermudo, and was home to Queen Dido and Yran, Solomon's friend.

According to Lazar, this work is less a pilgrim's itinerary than a Romance Bible, the oldest Romance Bible in all of Europe. However, the second half of the work seems to be more of a pilgrim's itinerary than the first. As the narration progresses, geography becomes more important than history; the narration of events which occurred in a single place becomes more important than that of events occurring in various different locations. The information provided is more specific and seems to be firsthand. In sum, this work appears to be based more on firsthand observation, and

less on formulae, than Lazar believes. It is a personal description of places embedded in a literary synopsis of the Bible.

FÉBUS, FRANÇOIS, AND CATHERINE OF NAVARRE

François Fébus (1481–1517) (or Phoebus), count of Foix and Bigorre, and heir of the sovereign principality of Béarn, became king of Navarre at the age of fourteen. His brief reign (1481–1483) suffered all the difficulties arising from a composite state that, straddling the Pyrenees, stretched from Tudela on the Ebro to Tarbes on the Adour, and was constantly threatened with attacks from the kingdom of France and from Spain. His double name reflected both the need to be on good terms with France (the name François pointing to his French ancestry through a sister of Louis XI) and the need to maintain his independence from France (his second name recalled Gaston III Fébus, the prestigious founder of the sovereign principality of Béarn in the fourteenth century).

When François Fébus died, all his estates went to his sister Catherine of Navarre, who had married Jean d'Albret, put forward by the French, rather than the heir of the throne of Castile, whom Navarre had suggested. In 1512 Catherine was ousted by Spain from the part of Navarre south of the Pyrenees. In vain her son Henri II d'Albret (who, caught between Spain and France, saw himself "as a louse between two monkeys") tried to regain Navarre, which was to remain Spanish. However, Henri did retain Navarre north of Ronscesvalles, which he left, together with the title of king to his grandson Henri III of Navarre-Béarn. When this grandson became Henri IV of France in 1589, his lands and his title passed to the Bourbon dynasty, which merged the Foix and Albret families.

FELIPE, INFANTE

Infante Felipe (1292–1327) was the son of Sancho IV of Castile (r. 1284–1295) and María de Molina. During the regency of his brother, Fernando IV (r.

1295–1312), Felipe accompanied their mother as she traveled to obtain support for Fernando from cities and regions. While he was still a child, María allocated to him lands in Galicia, where he fought Fernán Rodríguez de Castro. In 1308, after Felipe occupied Ponferrada, a town in Galicia belonging to his uncle, Infante Juan of Castile, the latter tried to foster a quarrel between Felipe and Fernando, but María prevented the development of any lasting animosity between them. After Fernando's death Felipe sided with Constança of Portugal, Fernando's widow, and Infante Juan against María and Felipe's brother Pedro over the regency for Alfonso XI of Castile (r. 1312–1350). Felipe did not recognize Pedro as regent until the Concord of Palazuelos in 1314. The following year Felipe married Margarita, daughter of Alfonso de la Cerda, titular king of Castile and perennial pretender.

When Juan and Pedro both died in battle at the Plains of Granada in June 1319, Felipe became one of the regents for Alfonso XI at the prompting of María de Molina, together with Don Juan Manuel and Juan el Tuerto. As regent with control over Andalucía and part of Castile, Felipe served to counter the ambitions of Juan Manuel by having more towns under his direct control, but he did not otherwise distinguish himself. He disappears from the historical record after Alfonso XI attained his majority in 1325, and Juan Manuel records his death as sometime during April 1327 in Madrid. He left no legitimate issue.

FELIX, BISHOP OF URGELL

Felix is best known for his support of the Adoptionist views advanced by Elipandus, Archbishop of Toledo. Because Urgell, located in the Pyrenees, happened to fall under Carolingian jurisdiction, Felix's alignment with Elipandus gave an international dimension to the Adoptionist controversy. In 792 Felix was brought to Ratisbon, where he was forced to abjure the heresy in the presence of Charlemagne and his assembled bishops. He was then sent to Rome, where he made a confession of his faith, but once back in Spain, he resumed his Adoptionist stance. At the Council of Frankfurt in 794, the bishops assembled by Charlemagne condemned the position of Elipandus. In 799 Pope Leo III, at Charlemagne's request, followed suit. Charlemagne sent for Felix and brought him to Aachen,

where once again he was forced to abjure. He died, confined in a monastery at Lyons, in 818. Bishop Agobard of Lyons later claimed to have found papers confirming that Felix remained true to his Adoptionist stance to the very end.

FERDINANDO (FERRANTE) OF NAPLES

Ferdinando (Ferrante) was born in 1424, the illegitimate (and only) son of Alfonso V of Aragón, and spent his childhood in Valencia. Summoned to Italy by his father in 1438, he became heir to the newly conquered kingdom of Naples in 1443. In the war between Alfonso and Florence (1452–1454) he led the Aragónese army in Tuscany without notable success. On his father's death (1458) he duly inherited the kingdom but had to overcome a baronial rebellion and an Angevin invasion before his possession was secure. There followed two decades of internal peace buttressed externally by alliance with his uncle Juan II of Aragón and Sforza Milan, and internally by a redistribution of lands and titles in which his numerous progeny (six legitimate and at least eight illegitimate) figured prominently. Traitors were eliminated by stratagems that, though familiar enough in that age, furnished his enemies with material for a "black legend." Ruling without recourse to a parliament from 1459 until 1491, he tightened administrative and fiscal controls in a drive to enhance royal authority and revenues in tandem with an expanding economy. He continued his father's patronage of the arts, especially in music and book collecting, and revived the University of Naples. Ties with Spain were reinforced in 1477 through marriage to his cousin Juana of Aragón.

Foreign adventures, beginning with seemingly victorious participation in a war against Florence (1478–1480), and a Turkish invasion of the kingdom (1480–1481) threatened this achievement. Venice and Rome fell upon a weakened Naples, and no sooner had he extricated himself—with Spanish and Milanese aid—from those dangers than a new baronial revolt exploded in 1485. Thanks to years of reorganization that had left the crown with overwhelming military advantage, it took only one year to crush the rebels, including sympathizers within government ranks. However, peace could not be made with their ally, Pope Innocent VIII, until 1492.

Ferdinando ended his reign unchallenged master within his kingdom, yet threatened from without by the antagonism of a new pope, Alexander VI; Ludovico Sforza in Milan; and the young Charles VIII of France, heir to Angevin claims upon Naples. He died on 25 January 1494, leaving his eldest son, Alfonso, heir to a menaced throne.

FERNÁNDEZ DE CÓRDOBA, GONZALO

Castilian general who served during the reign of the Catholic Monarchs. He distinguished himself in the campaign leading to the fall of Granada in 1492, as well as later in Italy against the French. He belonged to an illustrious Córdoba family of *converso* (Catholic convert) origins and was born in the castle of Montilla on 1 September 1453. His father was Pedro Fernández de Aguilar and his mother Elvira de Herrera, of the powerful Enríquez clan. Like his brother Alonso de Aguilar, count of Cabra, Fernández de Córdoba inherited both wealth and position. When he was thirteen years old, Fernández de Córdoba was sent to serve as a page in the court of Princess Isabel of Castile, whom he would support during the war of succession and continue to serve when she became queen in 1474.

Fernández de Córdoba distinguished himself militarily during the war against Granada, especially in the taking of Loja (1486), in which he led a daring group of 120 lances. In the period leading up to 1492 and the fall of Granada, he was also instrumental diplomatically in dealing with Boabdil, whom he had come to know during the latter's captivity at Porcuna, and al-Zagal. Fernando de Aragón named Fernández de Córdoba to the commission that negotiated the final capitulation of Granada.

The Catholic Monarchs' confidence in Fernández de Córdoba led to their continued patronage. In 1495 Isabel sent him on an expedition against the French in Naples, where he encountered great success. In 1497, at the instance of Pope Alexander VI, Fernández de Córdoba attacked and defeated the French garrison at Ostia near Rome, a feat that won him the acclamation of the Roman people.

Later, in 1500, Fernández de Córdoba returned to Italy at the head of a great army to assist Louis XII of France in the struggle against the Turks. With the help of the Venetian fleet, and after fierce resistance, he

vanquished the Turks on the island of Cephalonia, dealing a significant, though only brief, setback to Ottoman expansion in the eastern Mediterranean.

Fernando de Aragón and Louis XII agreed to divide the kingdom of Naples in the Treaty of Granada (1500), but the agreement soon broke down because of border disputes between them; it turned to all-out war in 1502. The Spanish army composed of light cavalry and Swiss pikemen was under the command of Fernández de Córdoba and won decisive victories against the French at Cerignola, Monte Cassino, and Garigliano. Fernández de Córdoba proclaimed the sovereignty of Fernando de Aragón over Sicily and governed it as viceroy under the king's name. Wary of the captain's ambitions, Fernando traveled to Italy to take possession of the kingdom and removed Fernández de Córdoba from power, obliging him to return to the Iberian Peninsula in 1507 as part of the king's retinue. Upon his return to Spain, Fernández de Córdoba retired to Loja. He died in Granada on 2 December 1515.

Fernández de Córdoba is recognized as the great military organizer and creator of the early modern Spanish army. His tactical innovations against the French in the Italian campaigns laid the groundwork for the Spanish military successes of the sixteenth century and won him a reputation throughout Europe as well as the distinction of being called El Gran Capitán.

FERNÁNDEZ, LUCAS

As musician, playwright, and cleric, Lucas Fernández was an active participant in the rich intellectual and cultural milieu of late fifteenth-century Salamanca. Born in 1474 and orphaned at the age of fifteen, he came under the tutelage of his uncles, who held important positions in the cathedral and the university. Fernández soon became a member of the cathedral choir and a student at the university, undoubtedly at the same time as Juan del Encina. In 1498 he obtained the position of cathedral cantor—also sought by Encina—and began a steady climb through the city's ecclesiastical and academic ranks, finally being named abbot in 1520 and professor of music in 1522.

Around 1496 Fernández joined the household of the duke of Alba as musician and poet. In that capacity he composed his three secular *comedias* or *farsas*, intended for performance at wedding feasts and other palace celebrations. The influence of Encina, who was also employed by the Alba family at the time, is strongly felt in Fernández's one-act pastoral eclogues, particularly in the character of the shepherd. Fernández's major contribution to the comic role of the *pastor* centers on his speech, the stage jargon known as *saya-gués*. By basing it more consistently on a mixture of archaic Castilian and the Leonese dialect spoken around Salamanca, and coarsening its vocabulary considerably, Fernández codified the comic language that was to dominate the Castilian stage throughout the sixteenth century. The simple amorous intrigues dramatized in Fernández's playlets are complicated by the social tensions that arise as the rustics confront soldiers, friars, courtiers, and other upper-class characters. Given Fernández's aristocratic patrons and audience, it is not surprising that the shepherd generally ends up the loser in such encounters. The most vivid example occurs in *Farsa de la doncella* (1497), where the noblewoman whom the shepherd lusts after taunts him for his total ignorance of courtly language and behavior, and an aristocratic rival thrashes him for aspiring to the love of a social superior. Recurring devices in these farces, such as the peasant's proud recitation of his lowly genealogy and his experience of love's pain as a digestive disorder, became comic set pieces among Fernández's successors. Some scholars attribute the satirizing of the peasants' ignorance, social pretension, and, in particular, their identification of honor with bloodline to the dramatist's stigmatized New Christian background, but this aspect of Fernández's biography remains undocumented.

Peasant ignorance and dissension serve a different function in Fernández's two Christmas plays (1500–1502), commissioned by the cathedral council. In *Égloga del nacimiento* the rustics' insolence initially prevents them from attending to the message of Christ's birth, proffered by the learned hermit Macario. This both vividly dramatizes mankind's need for Christ's redemption and serves the playwright's didactic goals, as Macario patiently resolves the shepherds' doubts about the Incarnation and the Virgin's lineage. As in the secular plays, a *villancico* sung in unison brings the action to a harmonious and joyful closure.

Fernández's greatest dramatic accomplishment is the *Auto de la Pasión* (ca. 1500). It is technically noteworthy for its dramatic use of stage directions; the call for the display of a cross, an *Ecce homo*, and a Sacred Host also suggest that it was performed in a church. The fact that the events leading up to the Crucifixion

occur entirely offstage heightens the dramatic impact of the play. Its intense emotional effect results from the graphic narration of Christ's suffering by St. Peter, St. Matthew, and the three Marys. The anguished questioning and lamentation of two anachronistic characters, Dionysius of Athens and Jeremiah, direct the audience's response.

In 1514 Fernández published his brief corpus of six plays under the title *Farsas y églogas al modo y estilo pastoril y castellano*, thus ensuring his contribution to the development of early Castilian drama. He died in 1542.

FERNANDO, II, KING OF ARAGÓN See CATHOLIC MONARCHS

FERNANDO DE ANTEQUERA See FERNANDO I, KING OF ARAGÓN; ENRIQUE III, KING OF CASTILE; JUAN II, KING OF CASTILE

FERNANDO DE LA CERDA

Fernando de la Cerda, the eldest son and the second child of Alfonso X of Castile and Queen Violante, was born in Valladolid on 23 October 1255 and was baptized on the eve of All Saints Day. Soon after his birth Mencía López de Haro, widow of Sancho II of Portugal, who held extensive estates in Castile, designated the child as her heir, thus laying the foundation for later protests made by other claimants to her property. Entrusted to the tutelage of Jofre de Loaysa, who served as his *ayo*, Fernando was also appointed *mayordomo mayor* (chief steward) in 1255, but others effectively carried out the duties of the office until he reached his majority. His betrothal to Blanche, a daughter of Louis IX of France, was arranged at Saint-Germain-en-Laye on 28 September 1266. When Fernando reached the canonical age of fourteen, the wedding was solemnized on 30 November 1269 in the Cistercian nunnery of Las Huelgas de Burgos. On that occasion Alfonso X knighted his son, who in turn knighted his younger brothers, except Sancho, who refused to receive knighthood from him. Fernando and Blanche had two children, Alfonso, born in 1270, and Fernando, born two years later.

In the course of the rebellion of the nobility in 1272–1273, King Alfonso appointed Fernando and his mother to negotiate with the nobles. In a notable letter to his eldest son, preserved in the royal chronicle, the king condemned the perceived treachery of the rebels. When Alfonso X decided to visit Pope Gregory X at Beaucaire in southern France concerning his imperial claims, he convened the *corte* (parliament) to Burgos in March 1274 and named Fernando as regent. Admonishing him to do justice to all the people of the realm, he entrusted him with the royal seals and authority to appoint all royal officials. Those present promised to accept Fernando as king should his father die during his journey.

As regent Fernando summoned the prelates to a meeting (*vistas*) in April 1275 at Peñafiel, where he attended to their grievances concerning the right of the clergy to be tried only in church courts, the obligation of all to observe ecclesiastical censures, clerical tax exemptions, and the restoration of church lands seized by nobles and others.

Later in the year disaster struck the kingdom. The Marinids of Morocco, taking advantage of the king's absence from the realm, invaded Castile in late spring. At the first news of the invasion, Fernando summoned the host and hastened to the frontier, but fell ill at Villarreal and died suddenly on 25 July 1275. To compound this misfortune, both Núño González de Lara, the *adelantado mayor de la frontera* of the frontier, and Archbishop Sancho II of Toledo were killed in September and October, respectively, while trying to repel the enemy. As Fernando lay dying, he expressed the hope that his son Alfonso, then five years of age, would eventually succeed to the throne, and entrusted him to the care of Juan Núñez de Lara, son of the deceased *adelantado*. Fernando was buried in Las Huelgas de Burgos. His tomb escaped plunder by intruders and was opened in 1943, revealing his remains, princely clothing, jewelry, and arms intact. His death was a grievous blow and created a difficult juridical problem. His older son, Alfonso, could claim recognition as heir to the throne, according to the principle of primogeniture and representation, but Alfonso's uncle Sancho appealed to older custom which indicated that a king's surviving son had a better right. When Alfonso X acknowledged Sancho in the cortes of Burgos in 1276, a struggle over the succession was begun that was not resolved for nearly thirty years.

FERNANDO I, KING OF ARAGÓN

Born in 1379, Fernando de Antequera was the second son of Juan I of Castile and Leonor of Aragón. During his lifetime he enjoyed a golden reputation for chivalrous conduct and honesty, and to a large extent modern historical scholarship has tended to confirm this view. It was a reputation that stemmed in the first instance from the circumstances arising from the problem of the succession to the throne at his elder brother's death.

Enrique III of Castile died at Toledo in 1406, at a time when representatives of the three estates had assembled for a meeting of the *corte*. The presumptive heir to the throne, Juan II, was not yet two years of age, and some believed that Fernando would claim the crown for himself. However, Fernando summoned the representatives of the *corte* to a meeting in the cathedral, persuaded them to accept the young *Infante* Juan as their king, arranged for his public acclamation, and then sent notables to Segovia to perform the ritual kissing of hands (*besamanos*) of the new monarch.

During the regency of the young Juan II, a regency uneasily shared by Fernando and the king's mother, Catherine of Lancaster, his reputation was further enhanced by his military campaigns against the Moors. During these campaigns he captured the stronghold of Antequera in 1410, the difficult and impressive task that earned him his sobriquet.

Shortly before this victory the childless Martín I of Aragón died, and Fernando put forward his claims to the Aragónese succession. The rival claims were considered at Caspe (Compromise of Caspe), and Fernando was proclaimed king in 1412.

As monarch of the Crown of Aragón, Fernando had to deal with several thorny problems. A rival claimant to the throne, Jaime (Jaume), Count of Urgell, initially accepted the decision of Caspe but rebelled in 1413, forcing Fernando to besiege him at Balaguer, confiscate all his possessions, and condemn him to life imprisonment.

In the Mediterranean, Fernando reached an understanding with the Genoese in a truce in 1413, signed treaties of friendship with Muslim powers in Egypt and Fez in 1414; pacified political anarchy in Sicily, eventually appointing his second son, Juan, as viceroy in 1415; and negotiated an end to a rebellion in Sardinia in 1416.

In Castile, Fernando promoted the powers of his sons, the *infantes* of Aragón, two of whom, Juan (later king of Navarre from 1425 and ruler of the Crown of Aragón from 1458 to 1479) and Enrique (master of the Order of Santiago), at various times posed serious threats to the Castilian monarchy.

More strikingly, Fernando resolved the Aragónese problem with respect to the Great Schism by withdraw-

ing his support from Benedict XIII, the pope who, along with Vicente Ferrer, had done so much to promote his candidature to the throne. The Aragónese withdrawal of obedience to Benedict XIII was proclaimed in January 1416. Fernando died in April 1416, and was buried in the monastery of Poblet.

Devoted to the Virgin Mary, Fernando de Antequera fused his religious inclinations with both his political ambitions and his cult of chivalry. On 15 August 1403, for example, he founded the chivalric Order of the Jar and the Griffin in honor of the Virgin at the Annunciation. The white lilies in the jar or pitcher of the order's device are symbolic both of Mary's purity and of the Immaculate Conception, and the griffin represents the defeat of Islam with the Virgin's help. With Fernando's election to the throne of Aragón, the Order of the Jar and the Griffin was transferred to Aragón and became highly prestigious.

Fernando astutely presented himself as the Virgin's candidate at Caspe, thus clearly implying a form of divine intervention—indeed, predestination—and playing down the elective element. Visually this interpretation of his success can be seen in the giant *retablo* in the Prado Museum, *Retablo del Arzobispo Sancho del Rojas*. In it the baby Jesus leans from his mother's lap and personally places a crown on the head of a kneeling Fernando. Not one elector is in sight.

FERNANDO I, KING OF LEÓN

The second son of Sancho III Garcés (el Mayor), king of Navarre (r. 1000–1035), and the sister of Count García Sánchez of Castile, Fernando was installed as the count of Castile when García Sánchez was murdered in 1029. Subsequently he was married to Sancha, sister of Vermudo III of León. After his father's death Fernando defeated and killed his father-in-law at Tamarón on 4 September 1037. Vermudo had no direct heirs, so Fernando and Sancha were recognized as the monarchs of León-Castile.

The royal couple seem to have faced no serious internal challenge to their rule. They began the reform of the church of the realm with a council held at Coyanza (modern Valencia de Don Juan) in 1055, although the acts of that meeting show that reform was largely

limited to a new policy of enforcing the traditional canon law. However, at some point in the ten years following, Fernando and Sancha entered into a close relationship with the great Burgundian reform monastery of Cluny, which would endure and grow under their heirs and successors. In return for Cluny's prayers for the well-being of their persons and dynasty, the Leonese monarchs began an annual subsidy of 1,000 gold dinars, which would do much to support the construction of a new, third monastic church structure at Cluny.

The royal couple also exerted themselves to enrich and endow the cathedrals and monasteries of their own realm. In 1063 an expedition to the Muslim *ṭā'ifa* (kingdom) of Seville secured the surrender of the relics of St. Isidore of Seville. These were transported to León and installed there in what would later become a major shrine. At the same time other relics were reclaimed from the ruins of Ávila and redistributed among the churches of the north. From what can be determined, Fernando and Sancha were comparatively modest in their patronage of Santiago de Compostela, even though the devotion and pilgrimage to the shrine of St. James was growing substantially during their reign. They were also generous to one of the favorite royal residences, the monastery of Sahagún, which was more central to the kingdom as it was then developing than was Santiago de Compostela. Despite all of this religious activity, relations between the churches of León-Castile and the papacy at Rome were minimal.

In the Christian north of the peninsula, Fernando asserted the hegemony of the new León-Castile that his victory in 1037 had established. During the reign of his father, lands in the Castilian northeast had been detached from that county and added to the kingdom of Navarre. That kingdom had been the portion of his older brother, García IV Sánchez (r. 1035–1054). Following the death of their father, relations between the brothers gradually worsened. On 15 September 1054, the two met in battle at Atapuerca, and García Sánchez was defeated and killed. The district of the Bureba, northeast of Burgos, was reclaimed for León-Castile, and the kingdom of Navarre became a tributary under Fernando's nephew, Sancho García IV (r. 1054–1076).

With the leadership of León-Castile secure in the Christian north, Fernando embarked on an ambitious series of campaigns against the Muslim *ṭā'ifa* kingdoms of the Iberian Peninsula. Perhaps as early as 1055 he launched his offensive against the Portuguese territories of Muslim Badajoz. On 29 November 1057 his forces took the town of Lamego, one hundred kilometers upriver from Christian Oporto. With that victory the valley of the Douro (Duero) River was secured for León. The next objective was the hill city of Viseu,

on the Mondego River to the south. It fell to Fernando's troops on 25 July 1058. Nevertheless, clearing the Mondego valley and plain of Muslims proved to be arduous. The key position was occupied by the hilltop fortress city of Coimbra, seventy kilometers southwest of Viseu. Not until 25 July 1064, after a six-month siege, did that city surrender to the Leonese. When it did, the northern two-fifths of modern Portugal had been reclaimed from the Muslims and could be reorganized as a possession of León-Castile.

More directly to the south of Fernando and Sancho's realm lay the *ṭāʾifa* of Toledo. It may have been a tributary as early as 1058, for in that year the last known Mozarabic bishop of Toledo was consecrated in León, presumably because of León's tributary status. Nevertheless, in 1062 Fernando's army invaded that *ṭāʾifa* took Talamanca, north of Madrid; and laid siege to Alcalá. The Muslim king, Al-Ma'mūn, agreed to annual *parias* (tribute payments) to secure Fernando's withdrawal. During the following year Fernando struck deep into Muslim Andalucía, ravaging the lands of the *ṭāʾifas* of Seville and Badajoz. If those two realms had not already pledged the payment of *parias*, they certainly began to do so at this time.

Prior to his southern campaigns Fernando had moved against the great *ṭāʾifa* of Zaragoza on the Middle Ebro River. The chronology is not clear, but probably in about 1060 he seized the territories on the upper Duero with their strongholds at San Esteban de Gormaz, Berlanga, and Vadorrey. He also took control of the rolling country to the south of the river about Santiuste, Huermeces, and Santamara. Most likely Zaragoza paid *parias* from this time, but in 1064 that kingdom broke off payments. The Leonese response involved a victorious campaign that carried all the way to the plains around Valencia on the Mediterranean. That Muslim kingdom had joined with Zaragoza in the attack on the Leonese positions on the upper Duero. It seems to have been turned over to Fernando's ally and tributary, Al-Ma'mūn of Toledo, but Zaragoza itself once again came under Leonese suzerainty.

Fernando now had reached both the apogee of his reign and the end of it. He died on 27 December, 1065, and was buried in the Church of St. Isidore in León. His wife, Sancha, lived until 27 November 1067. On the death of Fernando, the kingdom was divided among his three sons. The oldest, Sancho II (r. 1065–1072), received Castile and the tribute payments of Navarre and Seville.

FERNANDO II, KING OF LEÓN

The second surviving son of Alfonso VII of León-Castile and Berengaria, daughter of Count Ramón Berenguer IV of Barcelona, Fernando was born about 1137. He was associated in the government of the realm with his father and brother by 1152 and was knighted in 1155. Following the death of his father, the kingdom was partitioned. Fernando inherited the rule of Asturias de Oviedo, Galicia, a reduced León, and the Leonese Estremadura from Zamora south through Salamanca and Coria. His elder brother, Sancho III (r. 1157–1158), inherited the greater realm, including Asturias de Santillana, the Rioja, New Castile, and an Old Castile swollen to include territories as far west as Sahagún, Medina del Campo, Arévalo, and Ávila.

That division, and the sudden death of his brother, leaving a three-year-old son, the future Alfonso VIII (r. 1158–1214), meant that Fernando could hardly refrain from trying to exercise the regency in Castile. In the latter kingdom the magnate Lara and Castro families vied for control of the child and the government, and Fernando was ordinarily allied with the Castros. Though he never really controlled his young nephew's government, he did long occupy the royal city of Toledo. By 1170 Alfonso VIII had assumed control of his own affairs, and subsequently there was some minor fighting between Fernando and Alfonso over their respective borders.

The contention between Fernando and his cousin Alfonso I Enríques of Portugal (r. 1128–1185) was more serious. Both monarchs continued to claim and contend for control of the valley of the lower Miño, which today forms the border between those countries. In the south an aggressive Portugal made initial gains against the North African Almohads, capturing Alcácer do Sal, Évora, Cáceres, Trujillo, and Badajoz. Alarmed, Fernando intervened in 1169 and, after defeating Alfonso, forced him to surrender Trujillo and Cáceres and to withdraw from Badajoz. The latter recognized the suzerainty of León but retained its own Muslim ruler.

During the first fifteen years of his rule, Fernando II had pursued the Reconquest quite successfully, repopulating Ledesma, Ciudad Rodrigo, and Alcántara in the Leonese Estremadura and adding to these Truji-

llo and Cáceres, taken from the Portuguese. However, the circumstances changed dramatically in 1172, when the death of Ibn Mardānīsh, the great *tā'ifa* king of Valencia, Murcia, and Upper Andalusia, allowed the Almohads to unite Muslim Iberia. Their caliph, Abū Ya 'qūb Yūsuf, retook Cáceres and Alcántara in 1174 and pressed north to lay siege to Ciudad Rodrigo, although without success. The Muslims maintained the offensive in the west until their siege of Santarém in 1184. There Fernando came to the aid of Alfonso I Enríques of Portugal; the Almohads were routed and Abū Ya 'qūb Yūsuf was killed.

The Christian rulers in Iberia at this time came to rely increasingly upon the military orders to carry out the work of reconquest and repopulation. Both the Templars and the Hospitalers were already established in the peninsula, but native orders came to predominate. In the kingdom of León one of these was the Order of Santiago de Compostela, which had its beginnings at Cáceres in 1170 and was formally recognized by Pope Alexander III in 1175. Another was the Order of San Julián de Pereiro, which later changed its name to the Order of Alcántara when Alfonso IX of León conceded that frontier fortress to them in 1213.

Internally the development of the kingdom of León was brisk as agriculture, raising livestock, and the pilgrimage to Santiago de Compostela continued to flourish. In Galicia their growing wealth led the burghers of the towns to become increasingly impatient with the traditional control of secular affairs by their bishops. Fernando had to intervene repeatedly in Lugo to adjust relations between its *concejo* and the bishop, amending the *fueros* (code of laws) of that town. The same sort of problem occurred in Túy, on the sometime border with Portugal. Farther south, Fernando granted a *fuero* to Benevente, mediated a brief revolt in Zamora, and enlarged the privileges of Salamanca, where discontent had contributed to a short occupation by Alfonso Enríques in 1163.

Fernando II had married Urraca, the daughter of Afonso Henriques, in 1165 as part of a negotiated peace between the two monarchs. However, the royal couple shared a common great-grandfather, in Alfonso VI of León-Castile, and Pope Alexander III finally annulled the marriage in 1175 on grounds of consanguinity. Subsequently Fernando II had taken the noble Urraca López of Haro as mistress and had married her shortly before his death on 22 January 1188 and she had given birth to a son, Sancho. The king was interred in the cathedral at Santiago de Compostela. His seventeen-year-old son, Alfonso IX (r. 1188–1230), born of the Portuguese marriage, now faced the challenge of the queen mother to his right to succeed.

FERNANDO III, KING OF CASTILE

Fernando, king of Castile (1217–1252) and León (1230–1252), was the son of Alfonso IX of León and Berenguela, the daughter of Alfonso VIII of Castile. He was born in June or July 1201. After his parents separated in 1204, because of consanguinity, he was reared in his father's court. His mother, summoned him to Castile following the sudden death of her brother, Enrique I (r. 1214–1217). Though she was acknowledged as queen of Castile, she bowed to the wishes of the Castilians assembled at Valladolid and transferred her rights to the throne to her son, and Fernando III was then proclaimed king. When Alfonso IX discovered what had happened, he invaded Castile with the intention of uniting it to the Leonese crown, thereby restoring the unity of the two realms, separated since 1157. Finding little support for his cause, he retreated to León at the end of the summer and recognized Fernando as king of Castile in August 1218. Father and son pledged to live peacefully with one another and to act in concert against the Moors. Following his mother's counsel, Fernando III married Beatrice, daughter of the Holy Roman Emperor, Philip of Swabia and granddaughter of Frederick Barbarossa, at Burgos in 1219. As a consequence, their firstborn child, Alfonso X, was later able to put forward claims to the imperial throne.

As the Almohad empire that dominated Morocco and Muslim Spain began to disintegrate, Fernando directed his energy to the Reconquest. Seizing Quesada in 1224, he also accepted the vassalage of al-Bayasi, the ruler of Baeza, and his brother, Abū Zayd of Valencia, who hoped, with Castilian help, to secure their independence of the Almohads. Al-Bayasi collaborated with Fernando in his campaigns against Jaén and Granada in the summer of 1225, and his fellow Muslims, disgusted by his submissive attitude, murdered him the next year. Soon afterward the Moors of Spain threw off the last vestiges of Almohad authority, but as a result Muslim unity dissolved, thereby giving advantage to the Christian rulers.

While Fernando vainly attempted to besiege Jaén, his father captured Mérida and Badajoz. His death soon afterward, in September 1230, radically altered Fernando's fortunes. Although Alfonso IX had never formally determined the succession to the Leonese throne, Fernando claimed it at once and moved swiftly to take possession. In order to secure an undisputed title, he

had to persuade Alfonso IX's two surviving daughters by his first wife, Teresa of Portugal, to renounce their rights. The two former queens of León, Teresa and Berenguela, negotiated the settlement at Benavente on 11 December 1230, which compensated the infantas for their renunciation. Thus the kingdoms of León and Castile, separated since 1157, were reunited under Fernando, who was able to use their combined resources to prosecute the Reconquest.

Meanwhile, rivalry between Ibn Hūd of Murcia and Ibn al-Aḥmar (1232–1273), founder of the Naṣrid dynasty and the kingdom of Granada, benefited Fernando, who launched a major offensive that resulted in the capture of Úbeda in 1232. Elsewhere he laid waste the land around Arjona and Jaén, and threatened Córdoba and Seville. As 1235 drew to a close, a small band of Castilians, after invading the suburbs of Córdoba, quickly summoned Fernando to come to their aid. Receiving their message at Benavente in the middle of January 1236, he rapidly marched south and reached Córdoba on 7 February. In the weeks that followed, the bulk of his army tightened the siege of the city. When it became apparent that they could expect no help from their correligionists, the defenders surrendered on 29 June 1236. Those who wished to do so were permitted to leave, taking whatever they could carry, those who chose to remain were assured of religious liberty. The mosque of Córdoba was consecrated as a cathedral for the newly established Christian bishopric. The bells of Santiago de Compostela, which the Moorish ruler Al-Manṣūr, had carried off in 997 and hung in the mosque, were returned to the Christian shrine in Galicia.

In the years immediately following the conquest of Córdoba, many dependent towns and fortresses in the Guadalquivir valley submitted to Fernando. A few years later Murcia, in the southeast, also acknowledged his sovereignty. The assassination in 1238 of Ibn Hūd, who ruled Murcia, opened the possibility that the area might fall under the domination of Ibn al-Aḥmar, the emir of Tunis. To avert that, Ibn Hūd's family proposed to submit to Fernando as their suzerain and protector. Because he was ill, he sent his oldest son, Alfonso, to receive the homage of the Murcian towns. The Banū Hūd received him at Murcia in April 1243, and Lorca, Cartagena, and other towns, after a show of resistance, also submitted. As vassals of Fernando, the Murcian lords pledged an annual tribute of half their revenues, but otherwise they continued to rule as before. When Alfonso tried to seize Alcira and Játiva, towns reserved for Aragón (according to the Treaty of Cazola, 1179), he encountered opposition from Jaime I of Aragón. After negotiations they concluded the Treaty of Almizra on 26 March 1244, establishing the

boundaries between Castilian and Aragónese conquests in that part of the peninsula.

Once he had recovered from his illness, Fernando resumed the offensive, taking Arjona and several neighboring towns in 1244. His next objective was Jaén, a seemingly impregnable fortress. After systematically destroying the crops, the king blockaded the city in August 1245. Ibn al-Aḥmar, now the undisputed master in Granada, Jaén, Málaga, and Almería, was unable to offer any support to the defenders, who faced the real prospect of starvation. Because his hands were tied, Ibn al-Aḥmar authorized them to surrender in March 1246. As the Moors departed, Fernando introduced Christian settlers and converted the mosque into a cathedral. In the hope of preserving himself and his dynasty, Ibn al-Ahmar pledged homage and fealty to Fernando, promising to serve him as a loyal vassal, both in battle and in his court, and to pay a tribute of 150,000 *maravedis* over a term of twenty years.

Seville, the wealthiest city in all of Spain, a port on the lower Guadalquivir River with access to both the Mediterranean and the Atlantic, next attracted Fernando's attention. Preliminary operations disrupted the outer defenses of the city and severed supply lines. Alcalá de Guadaira, Carmona, Constantina, Reina, Lora, Cantillana, Guillena, Gerena, Alcalá del Río, and other adjacent towns capitulated in 1246–1247. A formal siege of Seville was established in July 1247.

The blockade of Seville was completed when Ramón Bonifaz of Burgos, acting on the king's orders, organized a fleet in the ports on the Bay of Cádiz and entered the mouth of the Guadalquivir. Repelling enemy ships, he made his way upriver and broke the bridge of boats connecting Seville and Triana. Their supplies steadily dwindling, the defenders appealed to the Almohads in North Africa for help, but in vain.

Isolated, with no expectation of relief, the defenders of Seville surrendered on 23 November 1248. Fernando III permitted them to leave, carrying their movable property, with safe conduct to Jerez or on Castilian ships to Ceuta, in Morocco. The Moors were given a month to settle their affairs before departure, and a Castilian garrison immediately occupied the *alcázar* fortress. Fernando entered the city in triumph on 22 December 1248. An archbishopric was established in Seville, and the king dedicated the remaining years of his reign to the colonization of Seville and the surrounding region, distributing houses and lands to those who had participated in the conquest or who were willing to settle there.

Fernando achieved the greatest success of all the Castilian kings in the Reconquest because the collapse of the Almohad Empire disrupted the unity of Muslim Spain. Taking advantage of the jealousies of rival

Moorish leaders, he gained control of the valley of the Guadalquivir from Úbeda to Seville and reduced the Moors of Murcia and Granada to the tributary status of vassals.

Aside from his efforts to eradicate Muslim rule in Spain, Fernando gave impetus to the development of the institutions and culture of his realm. He tried to reinvigorate the universities of Salamanca and Palencia, and welcomed scholars to his court. In the course of his reign, Castilian supplanted Latin as the official language of government and administration. His son, Alfonso X, eventually brought to fruition Fernando's plan to develop a uniform code of law for the kingdom. The *cortes*, in process of growth for a half-century, appeared as a fully constituted assembly of prelates, magnates, and townsmen representing the estates of the realm at Seville in 1250.

In the expectation of protecting his kingdom against any future Almohad intrusion into the peninsula, Fernando III was planning an invasion of North Africa, but death intervened on 30 May 1252. Buried in the cathedral at Seville, he was declared a saint by Pope Clement X in 1671. By his first wife, Beatrice of Swabia, he had had ten children including Alfonso X who succeed him. Two years after Beatrice's death in 1235, he had married Jeanne de Ponthieu, by whom he had three children.

FERNANDO IV, KING OF CASTILE

Fernando, the son of Sancho IV and María de Molina, was born on 6 December 1285 at Seville. He was only nine years of age when he succeeded his father on 25 April 1295. For many years his mother, a woman endowed with wisdom, determination, and diplomatic skill, strove to defend him and his throne against numerous enemies. His uncle Juan challenged his right to rule on the grounds that he was illegitimate, because the pope would not validate his parents' marriage. Continuing a quarrel of long standing, Alfonso de la Cerda (a grandson of Alfonso X) denied the rights of both Sancho and Fernando to the throne. Supporting Alfonso's claims, kings Jaime II of Aragón and Dinis of Portugal proposed a partition of Castile for their own advantage, and invaded the kingdom in 1296. The first break in this coalition came the following year, when Dinis agreed to sign the Treaty of Alcañices,

whereby Castile ceded certain frontier positions to him.

The new king's future began to take a turn for the better when he came of age in 1301. Pope Boniface VIII legitimated him in that year, thus removing any legal pretext for denying his right to the throne. As an assurance of peaceful relations with Portugal, Fernando married Dinis's daughter Constanza in 1302. Jaime II consented to submit Aragónese claims to Murcia to arbitration. The arbitrators, King Dinis, Infante Juan, and the bishop of Zaragoza, determined in 1304 that Jaime II should retain Alicante, Elche, Orihuela, and the lands north of the Segura River, but that the greater part of Murcia should be restored to Castile, in conformity with earlier treaties between the two kingdoms. Alfonso de la Cerda, in return for the cession of several towns and fortresses, gave up his claims to the Castilian throne.

Although internal peace was restored and the threat of external invasion was now removed, Fernando's relations with the nobility, who perceived him as essentially weak, were difficult. Nevertheless, he decided to resume the war of reconquest, taking advantage of domestic opposition to Muḥammad III, king of Granada. With that in mind, he concluded an alliance with Jaime II in December 1308, allotting to Aragón a sixth of the kingdom of Granada: the port of Almería and its dependencies. Previous treaties between the two kingdoms had reserved the whole of Granada for Castilian conquest. While the Aragónese laid siege to Almería in late July 1309, the Castilians besieged Algeciras and seized Gibraltar in August. Realizing that the loss of Gibraltar left him in a vulnerable position, Nāṣr, the new king of Granada, who had overthrown his brother, ceded Algeciras to the Marīnids of Morocco, in return for their alliance. Fernando had to abandon the siege of Algeciras in January 1310 because Infante Juan, Juan Manuel, and other discontented nobles withdrew from the royal host. Although the failure of the campaign was attributable in part to poor organization and ineffective coordination between armies and fleets, the primary responsibility rests with the halfhearted efforts of the Castilian nobility. Nevertheless, Fernando did retain possession of Gibraltar, though the Muslims recaptured it in 1333. His ally, Jaime II, had had to withdraw from Almería, returning home empty-handed.

As had happened so often in the past, the king of Granada, recognizing that the Marinids were a threat to his independence, turned away from them and again pledged homage and fealty to Fernando. Renewing the payment of tribute and paying an indemnity, Nasáuár also yielded several castles to Castile. His ambiguous attitude, however, provoked a revolt among his fellow

Muslims, causing him to appeal to Fernando for assistance in suppressing the rebels. The king set out for the frontier and captured Alcaudete, but became ill and died on 7 September 1312. He was only twenty-seven years of age.

By his marriage to Constanza, he had two children: Leonor, who married Alfonso IV of Aragón in 1329, and a son, Alfonso XI, born 13 August 1311, who succeeded him.

FERNÃO I, KING OF PORTUGAL

Fernão, born in 1345, was the son of Pedro I. Following his ascension to the throne in 1367, he formed alliances with England in hopes of becoming king of Castile. Upon the death of Pedro the Cruel of Castile in 1369, Fernão, citing his descent from Sancho IV and backed by Pedro's supporters and Catalonia-Aragón, claimed the Castilian throne against Enrique of Trastámara (Enrique II). Though Fernão occupied Galicia and blockaded Seville, Enrique defeated him. This and papal intervention in the struggle caused Fernão to make peace in March 1371. Fernão initially had been betrothed to Leonor, daughter of the king of Aragón, but under the provisions of the new Castilian-Portuguese treaty he was betrothed to Enrique II's daughter, also named Leonor. Fernão repudiated this betrothal in order to marry Leonor Teles de Meneses, whose husband, João Lourenço da Cunha, was still alive.

This Castilian-induced rupture with Aragón caused Fernão some personal economic hardship. This, combined with his dislike of the Castilian alliance, caused him to support the pretensions of John of Gaunt, duke of Lancaster, to the Castilian throne in 1372. The English defeats and Enrique's invasion of Portugal in 1373 led Fernão to request military aid from Edward III of England, but he was forced to sign the Treaty of Santarém with Enrique before help arrived. Even though the terms of the treaty stated that Fernão had to break with England and become the ally of Castile and France, he continued diplomatic relations with England. When Enrique died in 1379, Fernão once again openly allied with England, and fighting resumed between Portugal and Castile. Fernão's request for help from Richard II of England brought the earl of Cambridge to Portugal with an army.

Fernão had promised a marriage between his daughter and heir, Beatriz, and Cambridge's heir, but the failure of Cambridge's expedition and possibly the urgings of Queen Leonor caused Fernão to break this treaty and make peace with Castile. In 1383 Fernão married Beatriz to Juan I of Castile, although he later assured the English that he was not in favor of the marriage. Fernão attempted to ensure that Castile would not annex Portugal after he died by fixing the succession upon Beatriz's oldest child and making its grandmother, Queen Leonor, regent. However, when Fernão died on 22 October 1383, Juan claimed the throne on behalf of Beatriz. João, master of the military Order of Avis and Fernão's illegitimate half brother, emerged as King João I from the resulting war over the succession.

Fernão encouraged Portugal's merchant marine and laid the foundations for Portugal's later maritime success. The 1375 *Lei das Sesmarias* was an attempt to recultivate land and to counteract labor shortages caused by wars and plague; however, it was unable to stem the loss of agricultural workers.

FERRANTE, KING OF NAPLES See FERDINANDO (FERRANTE) OF NAPLES AND NAPLES, KINGDOM OF

FERRER, VICENTE, ST.

Son of a Girona notary, St. Vicente Ferrer (1350–1419) entered the Order of Preachers, studied theology, philosophy, and logic in Barcelona, Lérida, and Tortosa, having obtained the degree of master of theology by 1389.

After his ordination in 1378 he took up residence in Valencia, where he remained for some years and was known for his preaching and rivalry with his Franciscan contemporary, Francesc Eiximenis.

A lector in theology in the cathedral of Valencia, protected by the royal family and confessor to the heir to the throne Juan and his French wife, Violante, he was a strong supporter of Pope Clement VII in Avignon and later confessor to Benedict XIII. Called upon

to form part of the *junta* to settle the question of the papal schism, he was also among those who supported Fernando de Antequera in the Compromise of Caspe in 1412, subsequently enjoying good relations with him and acting as his constant adviser.

Between 1399 and 1412 Vicente traveled extensively throughout the Crown of Aragón, Castile, and even reached Flanders; after this date his missionary endeavors were intensified and his attention seemed to be directed primarily at the conversion of the Jews and Moors who were obliged to listen to his sermons. These occasions, like others from over a century earlier, frequently provoked the people to fervent expressions of faith and violent vituperations against the non-Christians.

Some of the sermons that he preached during the latter years of the fourteenth and beginning of the fifteenth centuries have been preserved, including some forty-three on the subject of Lent, which he preached in Valencia, and others he preached on ceremonial occasions, including one on Palm Sunday 1416 in Toulouse, where he had studied some years earlier. As was his custom he entered the town triumphantly, riding his mule, and preached indefatigably, but bystanders noted his sickly countenance, suggesting that by that date Vicente was no longer in good health. It is for his sermons on a wide variety of topics, many of which have survived in part if not in their entirety, that he is regarded as one of the great Catalan and Latin writers of the late Middle Ages. Studies have been made of his use of the *artes praedicandi*, a use reminiscent of the structure advocated in the treatise of Francesc Eiximenis known as the *Ars praedicandi populo*—a tripartite division consisting of introduction, theme, and exposition of the theme. The text was usually in Catalan and was chosen from the Bible, frequently from the Gospel for the day, but Vicente would frequently append its Latin equivalent. He then proceeded to enunciate the theme and explain its significance in contemporary language, often punctuating his exposé with exclamations and illustrative stories, miracles, lives of the saints, current events, and the occasional personal anecdote, at times dramatizing the stories or adding a touch of humor. His sources were those of any medieval friar—the Bible, patristic literature, lives of the saints, books of *exempla* and other similar compendia of useful material for preachers—but in his hands they took on a new significance, for they became a means of commentary on life around him.

He was a scholar, able to speak to his contemporaries using vocabulary and images they could understand and indicating to them the corruption he saw in all aspects of life. He criticized many of the daily customs and popular beliefs, bewailed the moral depravity

seen in the behavior of his contemporaries—lay and clerical alike—regarding the disintegration of society and the confusion that beset the church, characteristic of the late fourteenth and early fifteenth centuries, as signs that the end of the world was near. He is remembered for the sermons he preached in an attempt to make society aware of the problems and redress them before it was too late, and for the active role he played in resolving the questions of the Papal Schism and the royal succession to the Crown of Aragón, but most of all, perhaps, it is his contribution to Catalan language and literature that have ensured him a place in history.

Now regarded as patron of the city of Valencia and revered as a worker of miracles, his canonization process was begun under the Valencian pope, Calixtus III, in 1455, and completed three years later under his successor, Pius II.

FEUDALISM

One of greatest changes in western European society to result from the barbarian invasions of the fifth and sixth centuries was the spread of feudal relations. Despite the importance of the system that only in the seventeenth century came to be called feudalism, the real nature of this protective and service-based set of associations between freemen still awaits complete understanding. Recent studies, however, have attempted to show that there is no such thing as "classic" or "bastard" feudalism except in the tidy minds of modern institutional historians. Rather than being a perversion of the "model" of feudalism in northern Europe, then, the feudal relations in medieval Spain can be better understood as an adaptation to the unique conditions of Christian Iberian societies that had been forged in the crucible of war and coexistence with Islam.

The regime of feudal relations entered Spain from two sources, both of which emanated from the flow of barbarian peoples across the western provinces of the Roman Empire. The first source was the Visigothic kingdom that dominated the Iberian Peninsula from

the early sixth century until the Muslim invasions (711–718). Though emulating Rome in the issuance of such great law codes as the *Breviary of Alaric* and the *Book of Judges*, Visigothic rulers could scarcely re-create the centralized institutions of the empire. In lieu of a salaried, professional army, they relied on trains of personal retainers who fought in royal campaigns whenever required to. This class of warriors, called either “faithful men” (*fideles*) or “escorts” (*gardingi*), formed an important section of the itinerant royal court, the *aula regia*. Besides serving as the king’s army, they formed his bodyguard and routinely garrisoned his fortresses. While seeing to the immediate support of his retainers, the Visigothic monarch was occasionally impelled to reward their loyalty with grants of money or land, both of which came to be called benefices (*beneficia*).

This Visigothic model of retainers maintained by the sovereign whom they served was replicated, with very few changes, in the Visigothic survivor state that came into being in the late eighth century in the mountain fastness of Asturias. Similar societal norms spread to the realms that emerged from the Asturian kingdom: Aragón, Navarre, Castile, and León. As the Reconquest brought much of the Duero and Ebro river basins into Christian hands by the eleventh century, large swaths of land had to be brought under cultivation and held in defense against the ever-present danger of Muslim counterattack. Since the sovereigns of Aragón, Navarre, and León claimed as their own all of the territory they conquered from Islam, they were able to attract settlers into the reconquered lands without losing ultimate control over these valuable additions to their realms. The presence of a hostile frontier with the northern districts of the caliphate of Córdoba made land settlement a crucially important, though dangerous, undertaking that was ultimately fitted into the mosaic of royal government.

The sovereign was supported by a band of retainers, known as “the men of the king’s retinue” (*mesnaderos*), knights (*milites*), and the faithful (*fideles*). All of these royal supporters and fellow travelers were rewarded with grants of money or revenue sources (*solidata*) or unconditional gifts of land (*magnificentia*, *prestamonium*, *beneficia*). Though the greatest of these retainers, the lords (*seniores*), were given large territories and several castles to administer in the name of the sovereign, their status as warrior/administrators never evolved into that of independent feudal lords whose privileges and immunities effectively walled them off from royal control. The frontier nature of the new lands, coupled with the great influx of freemen into them by the twelfth century made “classical” feudalism effectively impossible in the states that emerged from the Asturian kingdom.

The formal bonds of homage and fealty entered the western realms only in the twelfth century, and even then they seldom implied the same complex of rights and services that formalized in Frankish feudalism. Such oaths were often seen as renewals of a kingdom’s allegiance to its king. The existence of such a broad-based feudal bond in Aragón has led Bisson to call it “a land of vassals.” In such a situation homage and fealty could imply quite different relationships and tenurial arrangements than in northern Europe. Not all the king’s men received fiefs; some were compensated with stipendiary grants instead. Even those holding land from sovereigns and lords did so under many different conditions. Some were given benefices as free gifts; the majority, however, received “tenancies” (*honores*) that in various ways fell under the shadow of royal or seignorial control. In many cases the *honor* remained a temporary grant that the sovereign could reclaim at the end of the tenant’s life. Neither were the revenues totally free, since the lord could annually claim at least a portion of them. Such grants were clearly not feudal in the northern European sense, even though the granting of true fiefs did begin, and spasmodically continued, from the thirteenth century. Despite this Catalan and Frankish influence, *honores* largely remained “public lands,” and the holders of them attained neither the full range of immunities nor owed the same services as vassals in other European regions. Thus even with such thirteenth-century works as the *Siete Partidas* and the *Fueros of Aragón*, which sought to harmonize western Iberian feudalism with “classical” norms, the “Spanish way” (*mos hispanicus*) of feudal relations was a unique one that owed its special open character to the danger and freedom which emanated from the ever-present frontier with Islam.

In Catalonia the descendant of the Carolingian Spanish March (*Marca Hispanica*), a style of feudal relations much closer to that current in France, came into being. As one branch of the defeated Visigothic realm scattered across the Pyrenees into the land of the Franks in the late eighth century, the “Spaniards” (*Hispani*) rapidly adapted to the tenurial norms of their Frankish benefactors. They gained a land base in southern France through the *aprisio* system, which allowed men to gain full possession of unclaimed land if they cultivated it for a prescribed term. When Charlemagne and Louis the Pious led invasions against the Muslim land between the Pyrenees and Tortosa in the last decades of the eighth century, the Hispani accompanied them and eventually provided the source of the official nobility that would rule the Spanish March. These Frankish agents, who bore the official title of count (*comes*), also referred to themselves as “princes” (*principes*) and “wielders of public authority” (*potes-*

tates). Though the society over which they held jurisdictional sway initially was composed of freemen, it became well experienced in the Frankish regime of fiefs and fealty long before the ninth century had waned. By 877 the Carolingian rulers had given the Hispani the right to receive benefices and pass them on to their heirs. The Spaniards thus increasingly turned to feudal tenure as a means of assuring networks of support and protection in the dark days of the tenth century when the structures of public power in the Spanish March became systemically weakened, though never fully overthrown, by the onslaught of feudalism.

The castle, instead of a distant Carolingian sovereign, became the true core of power in the Spanish March, and the proliferation of such fortresses gave the region the name “land of castellans,” which eventually evolved into Catalonia. The castle became a focus of allegiances between great lords, castellans, garrisons, and peasants. The terms of these personal alliances were realized in the ceremony of “homage” (*hominaticum*) and were sealed by oaths of “fealty” (*affidamentum, fidelitas*) made by the vassal (*vassalus, homo*) to his lord. Such proclamations of loyalty and service, generally written down in a pact (*convenientia*), were clearly tied to the lordly grant of a fief (*fevum, terra de feo*) to his vassal. Though originally the fief in Catalonia had been public land that officials used to support themselves, it came to personalize the lord-vassal relationship. Vassalic control of the fief was only provisional, since the lord could claim “control” (*potestas*) of it at any time and theoretically could settle it on anyone he wished when the vassal died. The social and tenurial advantage of feudal relations in Catalonia fueled the proliferation of such bonds between one vassal and several lords. To bring some order to this confusing situation, liege vassalage (*solidancia*) emerged in Catalonia. Declaring one of his many lords to be his liege lord (*melior senior*), the liege vassal swore to honor him above all others. When men began to take more than one liege lord, the complexities of the system became extremely dangerous, especially when two of a vassal’s liege lords waged war on one another and the vassal was caught in the dilemma of rendering military service to them both.

The system of feudal relations in Catalonia was clearly not a perfect one in comparison with the northern European model, yet the two elements that conspired to retard the broader development of Catalan feudalism stood outside it. The first was the continued existence of allodial land, especially in the districts between the Llobregat River and a Tortosa-Lérida line, which came to be called New Catalonia. The second was the persistence of public power in the person of the Catalan counts. From the ranks of the “official”

aristocracy, there stepped forward one personage who asserted a fuller sovereignty for his office—the count of Barcelona, Girona, and Ausona. From the reign of Ramón Berenguer I (1035–1076), the rulers of Barcelona began to form a niche in the diffuse and bellicose world that surrounded them. Rather than openly trying to enforce their suzerainty over the other Catalan counts and great lords, Ramón Berenguer I and his immediate successors attempted to rectify the norms of feudal relations and fief-holding while utilizing the public aspect of their comital office to extend their authority. The count of Barcelona as protector of general security—with his espousal of the peace and truce—and “legislator” (*legislator*) cast a much greater shadow than even the greatest of Catalonia’s feudal lords. This emergent fusing of public order with the customary law of feudal relations was frozen in legislation in Catalonia’s first great code, the *Usatges of Barcelona*. The authors of these laws, the well-trained and well-experienced curials (lawyers) of Ramón Berenguer IV (r. 1131–1162), intimately knew the feudal norms of Catalonia and yet propelled the regalist pretension of their master. As the influence of the count of Barcelona expanded, so did that of the *Usatges*; in the process Catalonia’s feudal custom was rectified under the political umbrella of the Barcelona ruler.

The tensions of this hybrid system, which combined feudal law with the structure of comital sovereignty, were all too obvious as the twelfth century waned. In the long and eventful reign of Jaime I (1213–1276), the wedding of crown and feudalism was a stormy one. The great commentator on the *Usatges*, Père Albert, sought to define the cases in which royal prerogative overrode feudal allegiance and vice versa. Despite such attempts to lay out good fences, the crown and the feudal world of Catalonia and Aragón did not often remain good neighbors. Between 1265 and 1348 the differences between feudal and royal law underpinned the intermittent rebellion of the Union of Aragón. Even after this baronial organization was crushed by Pedro IV (r. 1337–1378), the monopoly of Catalan feudalism remained largely intact in the countryside until challenged by a groundswell of peasant revolt (the *remensa* wars) in the late fifteenth century.

FLOR, ROGER DE

Corsair hero of the Sicilian Vespers War and leader of the mercenary Catalan Grand Company that devastated Byzantium, Flor was born about 1268. The memoirist Ramón Muntaner recorded his life, and Catalan letters and art have expanded his myth. In 1268 Roger's father, Richard Blume (Catalan, Flor), knight-falconer to Frederick II of Sicily, lost life and fortune to the Angevins at Tagliacozzo. Roger and his older brother James grew up in the dockside house of his affluent Apulian mother at Brindisi. A Templar sergeant at twenty, and captain of the order's best ship, the *Falcon*, Roger became a renegade when evacuating the Templar treasure from the fallen crusader city of Acre (1291). Hiring out as corsair to Catalan Sicily, with his personal fleet and army he was the scourge of Angevin shipping. Vice admiral and royal counselor by war's end, he leased his force to Byzantium in 1304 (36 ships, 1,500 horse, and 4,000 *almogávares*, Catalan mountaineer irregulars), demanding the title of grand

duke (later caesar) and marrying the emperor's niece. Roger was extremely generous and easily made friends; he already spoke Greek "well" and had a nubile daughter "by a lady of Cyprus." The Byzantine scholar Pachymeres describes him as "in the prime of life, with fierce eyes, quick reactions, and hot after adventure." Roger recovered all Anatolia from the Turks in bloody battles, carrying banners of emperor, pope, Sicily, and Aragón. In April 1305 the jealous co-emperor Michael IX Palaeologus invited him to a feast and assassinated him with his entourage, precipitating the "Catalan Vengeance." His son Rogero, born after Roger's death, was still alive in 1325.

FLORES, JUAN DE

A courtier, writer, knight, royal administrator, and diplomat, Flores was associated with the court of Garci Álvarez de Toledo, First Duke of Alba and, eventually, with that of the Catholic Monarchs. Extant documentation suggests that he was the nephew of Pedro Álvarez Osorio, third señor of Cabrera y Ribera and the first count of Lemos, and politically allied with the Enríquez, Osorio, Álvarez de Toledo, and Quiñones families. His formative years were probably spent at the ducal palace of Alba (Alba de Tormes), where he enjoyed considerable educational and political advantages, and in Salamanca, where he appears to have been active in local politics. On 20 May 1476 he was appointed official chronicler to Fernando and Isabel, and subsequently joined the royal entourage. During the civil war of the 1470s, he is known to have participated in attacks against the Portuguese and their *juanista* allies; there is evidence that he later joined Fernando in the Granada campaign. Documentation also suggests that he received various judicial assignments in Castile after 1477, and may have held the title of *protonotario de Lucena*. The dates of his birth and death are uncertain, but early genealogical sources suggest a long life, from about 1455 to 1525. He appears to have married Beatriz de Quiñones, a distant relative of Suero de Quiñones, and a son named Gaspar was apparently appointed chaplain to Isabel in 1503.

The extant works bearing Flores's name belong to a large body of courtly prose that examines the tragic nature of human passion, devotion, and intimacy. They include two sentimental romances, *Grisel y Mirabella*

and *Grimalte y Gradisa*, and an allegorical vision narrative, *Triunfo de Amor*, recovered in 1976. All probably were written between 1470 and 1477, the period of Flores's affiliation with the first duke of Alba. Of the three works, *Grisel* experienced the greatest commercial success, especially in the sixteenth century, when it was translated into numerous European languages as (*Historia de*) *Aurelio et Isabel*. It constitutes an ambiguous response to Pere Torroellas's *Coplas de las calidades de las donas* (before 1458), a superficially virulent, but arguably only playful, misogynistic poem. Although *Grisel* implicitly promotes the cause of women by condemning the egocentric nature of male passion and the political abuses of men, there are ironic indications that women lack the virtues they self-righteously claim for themselves. The romance ends with the ritualistic slaughter of Torrellas—a fictional persona of the real-life poet—by the queen of Scotland and her retinue. Flores may have intended to point out the equal contribution of both sexes to illicit love, while underscoring the inherently self-destructive nature of passion.

Owing to its emotional intensity and narrative sophistication, *Grimalte* is now generally recognized as Flores's masterpiece. A continuation and implicit interpretation of the *Elegia di Madonna Fiammetta* of Boccaccio (1313–1375), it seeks to reconcile the contradictory notions of sexual freedom, devotion, and social responsibility as perceived by Fiometa (Fiammetta), her lover Pánfilo, and their counterparts Gradisa and Grimalte. Grimalte's vain attempts to reunite the Italian couple ultimately result in Fiometa's suicide, Pánfilo's self-imposed exile, and the breakup of his own unstable relationship with Gradisa. Philosophically complex and engaging, *Grimalte* explores the selfish motivations for love and the tragedies that ensue from a one-sided passion. *Grimalte* became a favorite source of sentimental material for later chivalric romances, including *Tristán de Leonis* (1501) and the *Quarta parte de don Clarián de Landanís* (1528), which contain substantial plagiarisms.

Though largely addressing the same erotic themes as the romances, *Triunfo* is more lighthearted. A felicitous combination of courtly romance, political allegory, and fictionalized chronicle, it tells the story of Cupid's capture by disgruntled dead lovers seeking redress for their amorous suffering. Following a trial and death sentence, the god of love is rescued, and his supporters receive as a reward the reversal of the customary courting ritual: men replace women as the custodians of virtue and women importune them for sexual favors. In response to the social turmoil of the period, political issues receive prominent attention, but Flores

tends to exploit them as a vehicle for exploring the inevitable tension between joyous and tragic love.

Three other texts have been attributed to Flores with reasonable certainty: (1) *La coronación de la señora Gracisla*, (2) a short epistolary exchange between Tristan and Isolde, and (3) a fragmentary royal chronicle, the *Crónica incompleta de los Reyes Católicos*. Once thought to be artistically flawed, *Gracisla* is in fact a subtle *consolatio* written for Leonor de Acuña, the eldest daughter of Juan de Acuña, the second count of Valencia de don Juan, after the failure of her engagement to Pedro Álvarez Osorio, the third marquis of Astorga (April 1475). The work's plot, which relates the experiences of Gracisla, a Castilian maiden, at a beauty contest sponsored by the king of France, closely follows that of *Grisel*, and incorporates a number of allusions to actual events and individuals from the 1470s.

The *Crónica incompleta* represents Flores's official production as chronicler to the Catholic Monarchs. It is the most important source of information on his life and personal attitudes, since it contains circumstantial evidence of his activities in support of Isabel, most of which take place around Salamanca between 1475 and 1476. The extant text of the chronicle is evidently the copy of a working draft and has numerous gaps and inconsistencies. Nonetheless, it contains detailed information found in no other contemporary sources and has attracted the attention of historians. As a literary document it has hardly been studied.

Flores's works are known for their imagination, vividness of expression, and narrative complexity. He is a representative of a class of humanist knights dedicated to the ideals of the chivalric lifestyle, including the pursuit of literature as entertainment for the social elite. He is indisputably one of late medieval Spain's most prolific and versatile writers.

FOIX, HOUSE OF

The house of Foix had its origins in the family of the counts of Comminges-Couserans. In the eleventh century a partition of the domains of Count Roger the Old of Comminges produced the branch of the counts of

Foix. The counts emerged into prominence during the Albigensian crusades of the early thirteenth century, when Count Raymond-Roger assumed a leading role in resistance to the northern invaders. On the death of Raymond VII of Toulouse in 1249, the counts of Foix became the most important remaining independent lords of lower Languedoc.

During the fourteenth century the counts began to assemble the elements of the trans-Pyrenees principality that came to include the kingdom of Navarre. Through the marriage of Count Roger-Bernard III to Marguérite de Moncada they acquired a claim to the viscounty of Béarn in 1290. This inheritance was disputed by the counts of Armagnac, initiating the struggle between Armagnac and Foix that continued through the reign of the mercurial Count Gaston III Phoebus (1343–1391).

Frequently allied with the English during the Hundred Years' War, the counts of Foix became reconciled to the monarchy of France on the accession of Charles VII. Their domains reached their greatest extent with the marriage of Count Gaston IV (1436–1472) to Eleanor, heiress to the kingdom of Navarre. Following the reign of François Phoebus (1479–1483), Catherine of Foix and her husband, Jean d'Albret, ruled the united principality of Foix, Béarn, and Navarre into the sixteenth century. The inheritance, less the territory of upper Navarre conquered by Fernando II of Aragón in 1512, passed to the future Henri IV of France in 1572.

FOLKLORE

Not far beneath every genre of written literature in medieval Spain lay a substratum of oral folk literature that was always available to, and often utilized by, authors who wrote in Latin, Hebrew, Arabic, or the vernacular languages. The poet who composed, probably in the twelfth century, the *Poema de Mio Cid* used popular sources, motifs, beliefs, and superstitions. In the thirteenth century Gil de Zamora in his *Liber Mariae* used folk miracles, and Gonzalo de Berceo in his *Milagros de Nuestra Señora* enlivened and embellished his anthology with folk speech, proverbial expressions and motifs, and, in the twenty-fifth miracle—the only original one in the *Milagros*—he relied

upon local lore and legend, and possibly folk law. Even the erudite King Alfonso X el Sabio inserted many folk miracles into his *Cantigas de Santa María*, and his son, Sancho IV, followed in his father's footsteps in *Castigos e documentos*. In the fourteenth century Alfonso's nephew, Juan Manuel, in his *Conde Lucanor*, utilized stories and motifs from oral sources, and his contemporary Juan Ruiz, in his *Libro de buen amor*, used tales, proverbs, and colloquial expressions garnered from oral lore.

Writers of novelesque pieces in the fourteenth and fifteenth centuries included much folkloristic material in their works, for example, in *Libro del caballero Zifar*, *Amadís de Gaula*, and *Gran conquista de Ultramar*. In the fifteenth century Clemente Sánchez de Vercial in his *Libro de los exenplos por a.b.c.* and the writer who translated Odo of Cheriton's *Fabulae* into Spanish as the *Libro de los gatos*, included folk material. Alfonso Martínez de Toledo in his *Corbacho* likewise made folklore a vital part of his work, not only in the area of folk speech but also in some of his brief narratives. The vast body of Spanish ballads of the fifteenth and later centuries always made folklore a significant part of their language and subject matter. In that same century *Lazarillo de Tormes*, the *Abencerraje*, and the *Guerras civiles de Granada* depended to a considerable extent upon folk sources. In the Renaissance and the Golden Age authors often dipped into folklore: Juan de Timoneda, Cervantes, Lope de Vega, Guillén de Castro, Calderón de la Barca, and many, many others made use of popular lore for their most important works.

The substratum of folklore—folk language and literature, folk art and folk music—will never be exhausted, not only because it is rich in sempeternal motifs but also because it is self-perpetuating and continually creative. Albert Lord in his *The Singer of Tales* clarified the creative powers of epicry, including the *Poema de Mio Cid*, and Stith Thompson in his *The Folktale* and *Motif-Index of Folk Literature* proved the debt that from its earliest beginnings brief narrative owes to folktales.

In the Iberian Peninsula folklore absorbed a great deal of the *Matière de Rome* and the *Matière de Bretagne*, along with the folklore of the Visigoths and of the Muslim invaders, as well as from the Jews. The folk heritage, while not as important in the formation of medieval thought and religion, was ever present, and to a degree it even made itself felt in erudite and ecclesiastical circles. Whether it came from the age-old "native folk heritage" stemming from the Iberians, Phoenicians, Greeks, and Romans; from the Celtic and Germanic backgrounds and from the literary echoes of these sources; from the literature and/or the folklore

of the East; or from other European cultures, Spanish folklore had a powerful impact upon formal literature and upon contemporary popular culture. The fact that so much of folklore and folk literature was first narrated and later written in the vernaculars of Spain may have done much to separate it from the heritage of erudition. But in spite of this or other reasons, vernacular literature in its oral form was from the Middle Ages onward as integral a part of Spanish letters as any or all other literary elements.

FORAL

The *foral* (pl., *forais*) was a municipal regulation granted in Portugal by a king or a lord (church or secular nobility) to existing towns or to groups of families settled in new occupied areas. The *forais* rarely created new institutions and were little concerned about municipal organization. Their main goal was to define and specify taxation and the organization of justice. Nonetheless, they mentioned many local features that enable historians to study municipal government and daily life.

During the twelfth and thirteenth centuries *forais* were granted to most of the towns and large villages. A few were still granted in the fourteenth and fifteenth centuries. Their pattern differed somewhat according to the epoch, the size of the settlement, the purposes of the lord, and the legal training of the royal adviser. Some forms were imported from León and Castile; others were typically Portuguese. It has been possible to determine some six basic types of *forais* and to establish a sort of "family tree" connecting similar ones within each type. The *forais* should not be confused with communal charters. They did not create communes, the principle of which was very far from the Iberian tradition of community government. Self-rule was accepted, true, but only to a limited extent. In many cases all the officers had to be confirmed by the town's lord, generally the king. Self-administration was greatly reduced by a rigid system of taxation and a limited sphere of local justice. The king had the right to interfere frequently. Few attempts were made to secure a greater degree of self-government, which was

neither in the Islamic tradition nor in the conditions of life of early Portugal, where a strong central command was required.

Forais were also granted for other purposes, its name being gradually identified with "charter" or "bill of rights." Communities of free Muslims, for instance, had their own *forais*. Customs regulations, where taxation on imported and exported merchandise was established, were also called *forais*.

From 1472 on, a general revision of the *forais* was undertaken, first as a response to several municipal complaints against exaggerated and illegal taxation, then as a royal attempt to standardize the multiple forms and kinds of local revenues. Effective reform started only under King Manuel I, covering approximately the years 1497-1520. The new *forais* were now practically restricted to lists of taxes to be paid to the king or the feudal lords in each municipality. Furthermore, taxes were rendered more or less uniform, which incidentally reduced the historical interest of the charters for the study of common law and local life.

In the overseas dominions of the Portuguese crown, *forais* were granted to most towns throughout the fifteenth and sixteenth centuries. Thus, Funchal in Madeira, Ponta Delgada in the Azores, Goa in India, Macao in China, and Bahia in Brazil each had its *foral*, which was very often copied from a metropolitan charter granted to an important town. In this way patterns of administration and taxation were always similar to those in Portugal.

FORMULAIC COMPOSITION

One of the principal characteristics of oral traditional poetry is its formulaic diction. According to Parry and Lord's definition, a formula is "a group of words which is regularly employed under the same metrical conditions to express a given essential idea." That is, a formula has both rhythmic and acoustic value together with a narrative function. Formulas are the basic elements of the grammar of oral traditional poetry. They are adaptable in both content and prosodic form to a variety of contexts. The more permissive the verse form, the greater the variability of the formulas. There are fixed formulas, syntactic formulas, and formula patterns. The basic compositional unit is the hemistich,

but formulas can be extended to fill a full line or combined into longer series.

Command of basic formula patterns by the bard involves the development of substitution systems in which new phrases are created by analogy to those already in existence. The verse is a complete unit, to which subsequent verses may be linked by rhythmic and acoustic patterns as well as by paratactic devices like parallelism, opposition, and alliteration. This is the practice of a specialized art, characterized by controlled variation, which was learned during a long period of apprenticeship. Instead of restricting the performer, it offered him a wide range of appropriate phrases to draw upon. Variation from one performance to another was probably not great. The poet/singer's skill in the use of formulas determined to a large degree the quality of the product.

The oral-formulaic theory of poetic composition originated in response to the Homeric question. In his study of the noun-epithet formulas in Homer, Parry revealed the systematization of Homeric diction as evidence of its oral character. Since this theory was not generally acceptable to Homeric scholars at the time, he turned to the South Slavic oral epic tradition as a living analogue. This work was extended and completed by Albert Lord. In *The Singer of Tales*, the single most important work in the field, Lord studied the training and performance habits of the Serbo-Croatian bards as well as formulas, themes, and story patterns, and how they were used. His conclusions supported Parry's hypothesis concerning the oral traditional origin of the Homeric epics. Lord then applied his methodology to the medieval epic, reaching similar conclusions.

FRANCISCANS

Franciscans first appeared in the Iberian Peninsula shortly after the foundation of the Order of Friars Minor in 1209; in 1213 or 1214 St. Francis himself is said to have gone to Spain on his way to preach to the Muslims in North Africa, a journey that gave rise to numerous claims by towns as far apart as Barcelona and Santiago de Compostela that he either stayed in them or founded a house of his friars nearby. References are also made to the presence of some of his

followers who undertook missionary voyages to the peninsula, but the arrival of John Parenti in 1219 as provincial minister for Spain seems to herald the beginning of an organizational structure.

The first houses in the peninsula date from the 1220s, although in most cases their archives have disappeared; Barcelona, Girona, Lisbon, and Vic are among the few that possess records of their medieval houses, but for only Girona and Lisbon are they complete. By the 1230s many houses had been founded from Aragón and Catalonia to Galicia and Portugal, in Valencia and Mallorca, Navarre and Castile, and it was clear that the province must be subdivided into more manageable areas; hence the provinces of Aragón, Castile, Portugal (or Santiago), and Navarre. Each province was further divided into smaller groups of houses (custodies). By 1300 there were Franciscan houses throughout the peninsula, even in the territory held by the Moors in Andalusia.

The Franciscans, like all religious orders, received protection from the pope and from the king; they were exempt from episcopal jurisdiction, a privilege that brought them into conflict with the secular clergy, and in addition to their spiritual duties, they were frequently required to act as nuncios or ambassadors, look after valuables and important documents, dispense charity to the poor, and attend to outcasts such as lepers. In return they received gifts of land and privileges to draw water from royal wells and to transport grain from one area to another. Most significant of all, however, testators included them in their wills, frequently leaving them handsome sums of money that were sometimes beyond the capacity of their estate. They were not required to pay the tax on books demanded of other travelers, and because they traveled to centers of study beyond the peninsula, they often returned to their native area with new ideas.

In Catalonia and Mallorca especially, the Franciscans were influenced by the unorthodox beliefs of Joachim of Fiore and Peter John Olivi, and some were even imprisoned for their heretical beliefs. A few who had studied Arabic for missionary work in Africa embraced Islam; the most famous of them, Anselm Turmeda, died in Tunis, where the custody of Barcelona had a vicariate. Others, usually from privileged backgrounds, like Sancho López de Ayala, archbishop of Tarazona and then of Tarragona, and a relative of the king, reached the peak of the ecclesiastical hierarchy; some, like St. Anthony of Lisbon (or Padua) and Francesc Eiximenis, were renowned for their sermons and literary ability.

In addition to those who took the habit, lay men and women joined the Third Order of St. Francis and sought to follow the rule of poverty and service to

others in their daily lives. Some formed confraternities that, although they were not, strictly speaking, part of the Third Order, used the Rule of St. Francis as a basis for their organization and met on a regular basis in the Franciscan church with the superior or guardian of the house as their spiritual adviser.

By the late fourteenth century splendid conventual buildings had been erected, and many of the Gothic churches extant today owe much to Franciscan spirituality. Examples of fine medieval cloisters can be seen in Sangüesa, Mallorca, and Morella; the churches at Montblanc and Teruel show the size and simplicity of Gothic church architecture. Artists like Ferrer Bassa (his mural in the chapel of St. Michael at the convent of the Poor Clares at Pedralbes, Barcelona, still survives) and Lluís Borrassà (his most outstanding Franciscan painting depicts the three Orders of St. Francis gathered round their founder) painted scenes from the lives of St. Francis, St. Louis, and St. Clare, most of which have disappeared. Craftsmen of all kinds were employed in a variety of ways, and the visual impact of the Franciscan churches helped to illustrate their sermons both to Christians and to Jews, to whom they had a special mission.

Success brought prosperity, and prosperity threatened the simplicity of their founder's message; by 1400 the crisis within the order over how to interpret the Rule of St. Francis became more marked, and the houses in the Iberian Peninsula were divided into conventuals and observants, according to the way in which they conceived their spiritual calling and how it related to the rule. The rift contained the seeds of the troubled times of the fifteenth century and led up to the more serious issues of the Reformation.

FRÓILAZ, PEDRO, COUNT OF TRAVA

Pedro, Fróilaz, Count of Trava (?–ca.1123) was Alfonso VII's guardian during the reign of his mother, Queen Urraca of León. A prominent Galician magnate at the court of Urraca and her first husband, Raimundo

de Borgoña, he became the preceptor of their son, Alfonso. When Alfonso VI arranged Urraca's second marriage to Alfonso I in 1109, Fróilaz fomented a rebellion in Galicia, possibly in order to secure his charge's rights in case of offspring from Urraca's new marriage. Fróilaz lacked the support of the archbishop of Santiago, Diego Gelmírez, but his family held the northern lands of the province, and his stand provoked civil war. The crowning of Urraca's son Alfonso in 1111 mitigated the count's demands, but in the interim civil war broke out between Urraca and her spouse. Pedro Fróilaz and Bishop Gelmírez formed an army and recaptured Lugo, held by Alfonso I, and marched into León, where Alfonso I captured Pedro but Alfonso VII and Archbishop Gelmírez escaped. The count was released at some point and joined forces with Gelmírez, remaining at Alfonso VII's side. By 1116 Fróilaz and Alfonso VII campaigned against Aragónese forces, possibly at Urraca's request. In 1117 he assisted Urraca in the siege of Compostela, held against the townspeople who had rioted against Urraca and Gelmírez. This unity did not last; in 1120 Urraca campaigned against some of his followers in Galicia. Perhaps because of his activities Urraca considered him an overmighty vassal; his children's alliances with her sister, Teresa of Portugal, did not raise him in the queen's estimation, nor his control over Galicia. Urraca had Pedro Fróilaz imprisoned in 1123; there is no record of him after that.

Fróilaz married twice. The children of his first marriage with Urraca were Vermudo (who married Urraca Enriquez, daughter of Teresa of Portugal); Fernando (lover of Teresa of Portugal), Lupa, and Jimena. The children of his second marriage with Guntruda or Mayor Rodríguez, were Rodrigo, García, Velasco, and seven daughters.

FRONTIER

In the Iberian Peninsula the frontier was the strip of territory between Christian and Muslim Spain. From the eighth to the fifteenth century, Spain was divided by a ragged no-man's-land separating the Christian and Muslim realms of the peninsula. This intermediate zone, whether referred to as *frontera*, *marca*, or *limes*, served an extremely important military function as the site for both Muslim and Christian castle networks.

Despite the difficulties in tracing this rather amorphous buffer zone, certain very definite conclusions can be drawn about its configuration at any one time by a study of the military relations of the two Spains. By and large the Muslims, after the initial conquests, were unable to make large gains at the expense of their Christian neighbors. It was the Christians of Castile-León, the Crown of Aragón, and Portugal who, by individual settlement and concerted royal attack, pushed the frontier steadily southward. With the breakup of the caliphate of Córdoba in the early eleventh century, this movement was intensified, and by the end of the thirteenth century, the Christian states, with the conquests of Lérida, Tortosa, Córdoba, and Seville between 1148 and 1248, had driven the frontier to the Guadarramas, the *cordillera* that marked the doorway of the kingdom of Granada. Seemingly poised for the final extension of its borders, Castile, the only late medieval Christian state to share a frontier with Granada, was diverted by a series of disastrous civil wars from its reconquest mission until the accession of the Catholic Monarchs.

The Spanish, and indeed every, frontier stands as "a wild place coming under order." The presence of a hostile boundary could not fail to mold the society of Castile. Initially composed of men drawn to a realm of both danger and freedom that was spoken eloquently of in the *fueros* (charters) of the border settlements, the Castilian frontier society eventually came to be bound more by clan than by legal ties and was a world of quick and violent response to affronts that caused *vergüenza* (shame) to clan honor. On the Muslim side of the frontier, the society was molded by a siege mentality that periodically brought volunteers from all Islam to defend the beleaguered kingdom of Granada against the infidel.

While the Iberian frontier came to symbolize the holy and chivalric war that would be fought and imagined as the Spanish reconquest, it had as much to do with forging connections between the two Spains. Though attempts were made to control it, commerce—much of it in the form of smuggling—flowed across the border. The border was also permeable to a composite Muslim-Christian justice that sent agents (*rastreros*, *alfaqueques*) to settle disputes and punish crimes that involved men of different faiths. This was rendered possible by the linguistic continuum of the Iberian frontier, which routinely provided individuals fluent in both Arabic and Castilian. Such a language bridge facilitated a remarkable cultural interaction that manifested itself in a set of unique hybrid artistic, literary, and musical forms.

Even with these connections, the frontier remained for Castile a symbol of an unending but also neglected war with the Muslim infidel, as many Fran-

ciscan preachers reiterated during the later Middle Ages. Added to this call to arms against Muslim neighbors was an overlay of millenarianism that saw the defeat of the Muslims by an Iberian ruler as fulfillment of prophecy that would lead inexorably to the last days. From this brand of fanaticism came a certitude that even the existence of a frontier with Islam was unconscionable. In 1492 the frontier was eradicated with the conquest of Granada. Nevertheless, the lessons it had taught in language, politics, commerce, and stock raising, as well as the cultural norms it had imparted, continued to define a Spanish national character that was transported to the New World, and there was duly transmuted by yet another set of frontiers.

FRUCTUOSUS OF BRAGA, ST.

Fructuosus, very likely the most important figure in Visigothic church history after the death of St. Isidore of Seville (636), nevertheless is quite inadequately known because the sources, principally his own *Regula monachorum*, certain *decretals* of the Tenth Council of Toledo (656), and the anonymous *Vita sancti Fructuosi* composed between 670 and 680, cast light on his ascetic spirituality but are notably reticent on the major events of his monastic-episcopal career.

Born in 610/15 to a Visigothic noble family rooted in the Narbonensis, Fructuosus became closely associated with Galicia through his father's rank as duke of that province, which still extended, as in Roman and Suevic times, to the Douro (Duero) River. Attracted to the monastic life under Bishop Conantius of Astorga, he founded in the nearby Bierzo wilderness a cenobium for which, between 635 and 640, he wrote his extremely rigorous *Regula monachorum*. Other foundations followed, generating a widespread monastic movement in religiously backward Galicia in which the nun Benedicta played a significant role. Close to 650, apparently just after Fructuosus traveled to Baetica (Andalusia) and founded two monastic houses there, he prepared to depart Spain for the revered

homelands of monasticism in the Byzantine East. Halted in this plan by King Reccesvinth and brought before the monarch at Toledo, Fructuosus evidently persuaded this able ruler to support him in bringing about, along monastic lines, a thorough reform of the decadent Galician church.

The campaign opened in 654 with the deposition of the abbot-bishop Riccimir of Dumio, and in 656 that of the metropolitan bishop Potamius of Braga; in both instances Fructuosus took over the see, holding them simultaneously. This fact alone demonstrates beyond question, despite the complete silence of the sources in this regard, that Fructuosus now regarded himself as the heir and renewer of the project of St. Martin of Braga (d. 579), who, after founding the abbey-bishopric of Dumio and linking it, as *episcopus sub regula*, with his subsequent office as metropolitan of Braga, sought to create a sternly monasticized clergy in Galicia. The effort failed, not least through the Visigothic Eingeovigild's annexation of Suevic Galicia. Now, in his terminal decade as *sub regula* of the again conjoined sees of Dumio and Braga, Fructuosus undertook to reverse the secularizing and decadent course of the provincial church, an effort of which all too little is known, although it was manifestly the subject of conflict in the final half-century of the Visigothic state. At his death around 665, Fructuosus was buried in a monastery of his own foundation located between Dumio and Braga.

Dimly though they are known, Fructuosus's devoted labors on behalf of monasticism and the church as a whole are impressive and undoubtedly, along with his cult, survived in some degree into the early Reconquest. He must not, however, contrary to much tradition, be assigned authorship of the *Regula communis*, a collection of decrees.

FUEROS, ARAGONESE

Aragón was a small and swiftly expanding country, and its early *fueros* (charters) were granted primarily to attract settlers. As a consequence they generally conferred immunities and protection rather than imposing obligations and restrictions. In Aragón, the word *fuego* became synonymous with "privilege." The nature of

such privileges depended on the quality of settlers being sought. Three families of Aragónese *fueros* thus emerged, geographically differentiated and corresponding to the three major classes of Aragónese society.

In the Pyrenees region the purpose of settlement was economic development. The *fueros* of Jaca (1077) were intended to attract merchants and artisans, particularly from France. They were characterized by a general equality of classes under the law, strict protection of private property, freedom of the individual from imposts and seigniorial monopolies, restraint of violence, and a due respect for weights and measures. The example of Jaca spread swiftly throughout the Pyrenees region; by the thirteenth century the *fuego* of Jaca applied to virtually all of Aragón north of the Guara Mountains.

South of this area, in the plains and river valleys conquered in the course of the twelfth century, mounted warriors were needed to govern the land and fight the Muslims. Here the monarchs offered *fueros* favoring the noble, or *infanzón*, class. The *fueros* of Barbastro (1100) and Zaragoza (1119) are good examples of this family of privileges, which was characterized by legal discrimination in favor of the nobility, and the enhancement and protection of seigniorial rights. *Infanzones* were required to perform only three days of military service at their own cost, could clear themselves in court by either oath or battle, were free of taxes on flocks throughout the realm, and had the right to farm open land at will. This family of *fueros* became the most widely diffused in Aragón south of the Guaras.

Infantry was needed along the immediate frontier with Castile and the Muslims, and peasant/warriors were sought. The *fuego* of Calatayud typifies this third family. The community was granted judicial autonomy, and authority was vested in a council with an elected judge. Settlers were pardoned of all previous crimes, and status was regarded less as a matter of birth than of personal accomplishments and finances. Kindred were expected to seek vengeance for wrongs, and relatively high levels of civil violence were tolerated. Immunity from numerous restrictions, obligations, and monopolies attracted men and women to dangerous and undeveloped frontier outposts.

In Jaca the local *fueros* were amplified and extended throughout the course of the twelfth century in a manner that reflected the ascendancy of the aristocracy in both political and economic affairs, as well as a growing acceptance of the concept of the territoriality of the law. This modified *fuego* of Jaca became regarded as the *fuego* of Aragón, and by the thirteenth

century versions of it guided jurists in Huesca, Borja, and Zaragoza.

In 1247 King Jaime I convened *cortes* (parliament) in Huesca, where he entrusted the compilation of the *fueros* of Aragón to Vidal de Canellas, bishop of Huesca. The result was the Código de Huesca, actually one compilation for the use of the *cortes* and a second, more elaborate work for the guidance of the jurists and administrators of the realm. These compilations clearly promoted the privileged status of the *infanzón* class, and at the same time impeded the growth of royal power by restricting the application of Roman law in Aragón. Later *cortes* and kings added to the *Fueros* of Aragón, basic elements of which, having survived many vicissitudes, continue in force today.

The *fueros* of Aragón contained many noteworthy and admirable features, not the least of which was the *ley de manifestación*, which in the seventeenth century served the British Parliament as a model in the formulation of the Habeas Corpus Act.

FUEROS, CASTILIAN

Fuero is a term used in medieval Castile to indicate a body of rights and exemptions from standing obligations, or a contract governing the use of land between agreeing parties. The term derives from the Latin *forum*, and its application in Spain is especially tied to the fact that in Roman towns the forum constituted the place for administering justice. As a concept, *forum* received its widest territorial application as the title of the great code of law compiled by Hispanic and Visigothic jurists called the *Forum iudicum* (also *Liber iudiciorum*), later translated as the *Fuero juzgo*. The Asturian and Leonese monarchies strove to revive the *Fuero juzgo* in the ninth and tenth centuries with very limited success. This territorial use of the term *fuero* was renewed again in the thirteenth century by the Castilian kings Fernando III (r. 1217–1252) and Alfonso X (r. 1252–1284), when they attempted to apply the *Fuero juzgo* to the newly conquered towns in Extremadura and Andalusia. Meanwhile the term *fuero* had found other uses at the local level, especially in the nascent towns of the High Middle Ages.

By the tenth century *fuero* had come to denote local grants of rights and immunities by local authorities, and occasionally by the king, to communities of

persons. Portuguese and Catalan variants (*forais*, *furs*) appeared by the thirteenth century. Much of the inspiration for such grants arose from the need to populate the frontier lands acquired during the Reconquest. *Fueros* for villages and towns often took the form of *cartas pueblas*, documents that established the rights and obligations of the new settlers, along with a description of the municipal boundaries. Until the twelfth century the municipal *fueros* in Castile were comparatively brief. The *fuero* of León, given to that city between 1017 and 1020 by Alfonso V, became the landmark charter of this earlier type, and influenced a number of others in the eleventh century. That foral influences could cross political frontiers becomes clear when Sepúlveda (1076) in Castile and Jaca (1077) in Aragón received *fueros* with similarly worded military service requirements.

Once larger towns like Toledo fell into Castilian hands, the king granted *fueros* to particular groups within the municipality, as Alfonso VI did for the Mozarabs (1101) and Alfonso VII for the French settlers (1136). Such grants consisted of compromises between royal needs and local customs, then were worked into written form by the king's redactors. Periodically the monarchs would reconfirm them, making occasional revisions. During the twelfth century the municipal *fueros* grew steadily fuller and more comprehensive, evolving by century's end into municipal law codes occupying over a hundred folios in the contemporary manuscripts. The redactors of the charters often borrowed single laws and even entire charters from earlier municipal collections. The result was the creation of several models of municipal charters that spread through the various towns of a region, each model with individual aspects highly similar, if not identical, to other charters in that group. Such models with their variations are usually referred to as formularies or families.

The evolution of urban law between 1158 and 1190 has long been dominated by two monumental municipal charters that appear at the end of this period: the *fueros* of Cuenca and Teruel, given by Alfonso VIII of Castile and Alfonso II of Aragón, respectively. Municipal and legal historians have long sought the origins and purposes of the law contained in these codes, but the great complexity of the variables that contributed to their formation has defied easy generalization. Our understanding of regional law is further complicated by the occasional migration of laws and even entire codes from one kingdom to another. In general, Aragónese and Navarrese contributions to the process have tended to be disproportionately undervalued in favor of Castilian law. In fact, each of these regions produced *fueros* whose accumulation of prece-

dents clearly shaped the ultimate content of the Cuenca-Teruel family. From the Castilian side of the Iberian Cordillera, the charter that seems to be a harbinger of the law of Cuenca-Teruel is the *fuero* of Uclés, granted by the master of the Order of Santiago and subsequently confirmed by Alfonso VIII in 1179. The *fuero* of Zorita de los Canes of 1180 also is often singled out as significant. In the non-Castilian lands of the *cordillera*, two Aragónese *fueros* are noteworthy, the charters of Alfambra (1174–1176) and of Medinaceli (probably given in the 1180s).

In addition to royal initiatives, the regional law of the *cordillera* itself provided a source for the legal materials contained in the charters of Cuenca and Teruel. The *cordillera* proved to be a region of legal creativity embracing the southern frontier of Navarre, the eastern frontier of Castile, and the western frontier of Aragón. The fully elaborated *fueros* of Cuenca and Teruel contain remarkably complete municipal law codes for the late twelfth century. For example, the manner of electing municipal officials and the definition of their offices are treated in connection with the administrative layout of the town. Military topics include the raising of the town militia for offensive and defensive purposes, and the system of vigilance that guarded the territories of the town and assured the garrisoning of its walls. The management of the livestock herds occupies considerable space in these records, suggesting the importance of sheep in the Castilian economy. Social legislation informs us in detail about the role of women in the town, the place of the Muslim and Jewish minorities, and even the operation of the marketplace and the administration of the municipal bathhouses.

During the reign of Fernando III, the Cuenca format was granted initially or renewed at a considerable number of towns. The geographic situation of these municipalities can largely be organized into three groups. One extended along the *cordillera* frontier with Aragón, and another concentration was established in the La Mancha and Calatrava area north of the Sierra Morena Mountains. Finally, as pressure increased on Jaén and upper Andalucía was absorbed, a third group of Cuencan charters was granted in the upper Guadalquivir. As was the case in León and Portugal, the Cuenca pattern was granted by military orders and bishops as well as by the king. If there is any effective explanation for the movement of this cordilleran municipal law across the *meseta* (plateau) into La Mancha (and even Plasencia on the Leonese frontier), as well as its penetration into upper Andalucía, it probably lies with the great body of livestock laws in the pattern that tied the grazing zones of La Mancha and

upper Andalusia to the *cordillera* frontier towns established there after their conquest.

While not as full in content as the rich Cuenca-Teruel formularies, other important families of charters can be identified. García Gallo has argued in behalf of such a family in central Castile, based initially on grants given to Toledo at various points in the twelfth century. Of the charters assigned to the latter half of the century, the most interesting are the reconfirmation of the *fueros* of Toledo by Alfonso VIII (ca. 1166) and the portions of the *fuero* of Escalona that García Gallo dates to the later twelfth century. Fernando III revitalized this family in the first decade of his reign (1217–1227). A number of his early grants appear to have strong ties to the twelfth-century Toledan pattern, especially those to Guadalajara, Palenzuela, Talamanca, Ávila, Uceda, Peñafiel, and Madrid. The capture of Córdoba in 1236 provided the opportunity to enlarge the size and content of the Toledan format. Córdoba was the largest town captured in the Reconquest since the taking of Toledo in 1085, and this justified a reworking of the Toledo charter structure in order to give the new populace of settlers a proper *fuero*. Córdoba's new charter also marked an effort to provide an effective and updated counterpoise to the more liberal and rapidly spreading pattern of Cuenca-Teruel to the east and southeast. Thus, in 1241 a *fuero* was granted to Córdoba, a charter subsequently awarded to a number of towns in the remaining years of Fernando's reign, particularly Mula (1245), Cartagena (1246), Jaén (1248), Arjona (ca. 1248), Seville (1251), and Carmona (1252).

A third important area of influence emerged during the twelfth century in the kingdom of León (while it was temporarily separated from Castile) and in Portugal. A family of large-scale charters developed on the frontier of León and Portugal after 1190. Indeed, the symmetrical opposite of the Cuenca-Teruel family seemed to be developing on the Leonese-Portuguese frontier, with four Portuguese and three Leonese variants surviving. However, the law contained therein does not represent the balance of Portuguese and Leonese contributions across the political frontier that can be observed in Cuenca-Teruel. Rather, the law is almost exclusively Leonese, and all of the surviving examples were originally granted by Leonese-Castilian monarchs during the thirteenth century. Although four of the places receiving these charters were subsequently absorbed into Portugal, there is little evidence that they influenced the later law of Portugal or that prior Portuguese law influenced the content of the foral family. Martínez Díez worked out a relationship among the surviving charters and named the group the Coria Cima-Coa family. The Latin original granted to

Ciudad Rodrigo after 1190 does not survive, but a copy made from it for Alfaiates exists, and a copy made for Castelo Rodrigo after 1230 survives in two direct descendants from the thirteenth century at Castelo Rodrigo and Castelo Melhor. By 1227 the town of Coria had been awarded a Latin version of this charter, leading to subsequent versions at Castelo Bom, Cáceres, and Usagre, and a late surviving vernacular version of Coria. The original was granted to Ciudad Rodrigo by Alfonso IX of León almost certainly with the extensive model of Cuenca-Teruel in mind, and was designed to summarize territorial law in the same manner.

The rather considerable number of freedoms granted and the sense of municipal independence connoted by the Cuenca-Teruel fueros posed problems for Fernando III and Alfonso X. Both to seek more uniformity in regional law and to reassert the place of the king as the central authority, Fernando made the aforementioned attempt to apply the *Fuero juzgo* to a number of towns. Alfonso followed by creating a new format, based on the Toledo family of laws, called the *Fuero real* and granted to a number of towns. The revolts of the Muslims, townsmen, and nobles at various points in the last twenty years of Alfonso's reign seems to have thwarted the learned king's effort to make this universal. However, his great Romanized collection, the *Siete Partidas*, would ultimately gain dominance in later centuries by establishing royal law over the regionalized customs represented by the *fueros*.

FUEROS, VALENCIAN AND CATALAN

A *fuero* was the customary law of a Spanish place (local) or region (territorial), eventually organized in writing and approved by the ruler or regranted elsewhere by him, from then on, it could not be changed

unilaterally. Notable collections in Catalan lands include Barcelona's *Usatges*, the *Costums de Catalunya*, and the *Costums* of Girona, Lérida, Mallorca, Roussillon, and Tortosa, as well as the maritime *Costums de mar* (*Libre del Consolat del mar*). *Fueros* (also *furs*) were distinct from the *actes* issued by one or two estates of a *corte* and from a *constitutió* issued by the ruler backed by all three estates (as at Barcelona in 1283). The *usatges*, in various compilations from the eleventh century to the definitive redaction in the thirteenth, represented the comital rule and often framed or supplemented other *fueros*. Lérida's and Tortosa's compilations date from the thirteenth century; Girona's and Perpignan's, from the early fourteenth. Below these larger codes were settlement charters (*cartes de població*), collective agrarian contracts issued by public authority either to attract or to establish settlers on new lands as a kind of colonial constitution. Font i Rius has gathered nearly 400 of these for Catalán lands over seven medieval centuries; Miguel Gual Camarena collected 300 for Valencia.

Valencia was unique in the thirteenth century. Antipathetic juridical imports contended in a conquered Islamic kingdom. Before its first *costum* filled this vacuum, at least nineteen places had borrowed the *fuero* of Aragónese Zaragoza and seven, the *fueros* of Catalan Lérida. Roman law enthusiasm and practitioners were prominent, meanwhile, and a Catalan-dominated capital made possible an advanced, monarchical code against conservative Aragónese influence. King Jaime I promulgated the highly Romanized Latin *Fori* or *Costums de Valencia* around 1240, long before the whole realm was conquered. Conferred for the city of Valencia, a provision assured that it was meant to spread over the kingdom. Indeed, it was the earliest Roman law code of general application in Europe, against the claim of codes like that of Frederick II. The fuller *Furs de Valencia* in 1261 (revised in 1271) was in Catalan, promulgated by king and Valencian *corte*. Technically this *furs* was not a *fuero* but the cooperative new work of *corte* and ruler, like Barcelona's *constitutió* growing regularly thereafter by additional *furs* from each Valencian *corte*. The *furs* was printed in its proper chronological form in 1482, by traditional rubrics in 1547–1548, and in a critical edition beginning in 1970, the original Latin *Fori* in 1967.

G

GALAICO-PORTUGUESE LANGUAGE

Galaico-Portuguese developed from the Latin/Romance dialect spoken in the northwest corner of the Iberian Peninsula, in what had been the Roman province of Gallaecia (modern Galicia). It was brought south with the conquest of the Muslim-dominated areas, eventually replacing the southern Romance dialects.

Isolated from the main centers of linguistic innovations of late imperial times, Galaico-Portuguese has a phonetic structure that is, unsurprisingly, characterized by a general conservatism. The tonic vowel system is that of western Late Latin, the isochronic system of seven vowels, with open and closed midvowels in the front and back series: /i/ /e/ /ɛ/ /a/ /o/ /ɔ/ /u/—*lide* “battle” < LITE(M), *verde* “green” < VIRIDE(M), *azedo* “acetic” < ACĒTU(M), *dez* “ten” < DECE(M), *cabo* “end” < CAPUT, *forte* “strong” < FORTE(M), *nume* “name” < NŌMEN, *outono* “autumn” < AUTUMNU(M), *escudo* “shield” < SCŪTU(M).

This system remained without further basic change, unaffected by the wave of diphthongization that reached the central Hispano-Romance dialects. The atonic vowels likewise were /i/ /e/ /a/ /o/ /u/. The wave of syncope of posttonic vowels that affected most of early Western Romance evidently did not reach Galaico-Portuguese. Posttonic front vowels in contact with liquids consonants, and between /s/ or a nasal and another consonant, did drop, for the most part: for instance, *galgo* “greyhound” < GALLICU(M), *manga* “sleeve” < MANICA(M). However, many postatonic vowels remained in the medieval period, producing an accentual effect more like that of Italian: for examples, *bebera* “early fig” < BIFERA(M), *covedo* “elbow” < CUBITU(M), *divida* “debt” < DEBITA(M), *dúvida* “doubt” < *DUBITA, *lídimo* “legitimate” < LĒGITIMUS, *pessego* “peach” < (MALUM) PERSICU(M). Similarly, pretonic vowels not preceded by liquid consonants or nasals survived in medieval Portuguese: *cabedal* “capital” < CAPITĀLE, *saudar* “to greet” < SALŪTĀRE.

The preservation of the Late Latin yod, and other common changes, produced a number of offgliding diphthongs: FRUCTUS “fruit” > *fruito*, NOCTE “night” > *noite*, MAGIS “more” > *mais*. The Late Latin offgliding diphthong /ai/ evolved to /ei/: JĀNU-ĀRIUS > *janeiro*. The /au/ likewise became /ou/, as in CAUSA “cause” or “thing” > *cousa*.

A notable innovation of Portuguese is the weakening of intervocalic and syllable-final nasal consonants, resulting in a regular series of nasal vowels. Between like vowels, nasalization of the merged vowels was found: *bom* [bõ] < boo < Lat. BONU, *lã* [lã] “wool” < *laa* < LANA, *tens* [tes] “you have, hold” < *tees* < TENĒS. Between unlike vowels, nasalization tended to produce nasal diphthongs: *mão* “hand” < MANU, *irmão* “brother” < GERMĀNU, *pões* “you put, place” < PŌNES, *cães* “dogs” < CANĒS. In some words an initial nasal likewise produced nasalization of a following vowel: *mãe* “mother” < MĀTRE. In a number of words the nasal quality of an earlier vowel was subsequently lost: *areia* “sand” < *arêa* < ARENA, *boa* “good” (fem.) < *bõa* < BONA.

The metaphonic influence of final vowels on preceding tonic vowels also characterizes Portuguese. In modern standard Portuguese only three vowels are found in word-final position: a central vowel [ə], < Latin /-a/, and two high vowels [i u] that are reflexes of the merger of all Latin front and back vowels into a single front or back vowel. The effect of the high final vowels was to raise preceding tonic vowels: for instance, *isto* “this” (neuter) < ISTUD, *tudo* “all” (neuter) < *TŌTTU (C. L. TŌTUS). It is not certain whether the raising of final vowels goes back to Late Latin or is a medieval development. The evidence of modern Galician, in which the final back vowel is a close mid vowel [ɔ], would indicate that the closing of final vowels is a modern phenomenon.

In consonantal development, too, Galaico-Portuguese tends to be fairly conservative, with a few distinctive changes. The initial consonant groups of a

voiceless consonant with a lateral—in a way similar to Castilian, Leonese, and Italian—palatalized the /l/. The resulting group then became a voiceless palatal affricate /tʃ/—PLENU “full” > *cheio*, CLAMĀRE “to call” > *chamar*, FLAMMA “flame” > *chama*—and later a hushing fricative [ʃ].

Similar to the loss of single intervocalic nasals was the loss of the single intervocalic lateral /l/, as in *nevoa* “cloud” < NEBULA(M), *sair* “to leave” < SALĪRE “to jump, leap,” *povo* “people” < *povoo* < POPULU. The medial Latin /d/ also was dropped in a number of words: LAMPADA “lamp” > *lampaa*, NĪDU “nest” > *nio*. The loss of medial consonants produced a relatively large number of words with vowels in hiatus, including *nevoa*, *area*, *boa*, *saudar*, *nomear* < NŌMINĀRE, *vaidade* < VĀNITĀTE. When the same vowel appears in both syllables, they generally merged fairly soon: *povoo* > *povo* “people,” *viinte* > *vinte*, *seelo* > *selo*, *paaço* > *paço*. Other hiatus groups also tended to merge: ANELLUM “ring” > *eelo* > *elo*, VENĪRE “to come” > *viir* > *vir*, MONACHUM “monk” > *moago* > *mogo*, PALUMBUM “dove” > *paombo* > *pombo*. Geminate nasals and laterals simplified to a single nasal: ANNU “year” > *ano*. The loss of single intervocalic laterals and nasals must have been characteristic of the northern source of Galaico-Portuguese, for place names from Mozarabic dialects in southern Portugal reveal preservation: BASILICA > *Baselga*, FONTĀNĀS > *Fontanas*.

The affricates that developed in Late Latin from the combination of an occlusive and a yod, and from velar stops before a front vowel, are found in Galaico-Portuguese: FORTIA “strength” > *força*, RATIŌNE “reason” > *razão*, FACIŌ “I make, do” > *faço*, JŪDĪCIU “judgment” > *juízo*. The Western Romance voicing of simple intervocalic occlusives that one expects between vowels is frequently not found in the case of these affricates: PUTEU “well” > *poço*.

Medieval spelling is often inconsistent, especially in representing sounds not found in earlier Latin. Normally Latin spelling was used wherever possible. The nasal and lateral palatals were represented by digraphs, probably borrowed from Provençal spelling: *ob* as in TENEŌ “I hold, have” > *tenho*, FĪLIU “son” > *filho*. The palatal affricate /tʃ/ also was spelled by a digraph, *ch*, and the apical affricates /dz/ and /ts/ by *z* and *ç* (c before *e i*), respectively. The palatal fricative /ʃ/ was written *x*. The nasal vowels were often represented solely by preservation of Latin spelling, or by a final *m*, as in *bom*. The tilde likewise was used to spell nasal vowels, as in *razon* or *razõ*.

In morphology the loss of intervocalic /n/ and /l/ had important effects of derivation. Nouns and adjectives ending in these consonants formed plurals with-

out them: For instance, *sinal* “sign” and *sinaes*, *leon* “lion” and *leões*, *cao* “dog” and *cães*. The same phonetic change produced definite articles consisting of a single vowel: *o* and *a*. Verbs sometimes preserved older forms of the first-person singular indicative, as in MENTIO(R) “I lie” > *menço*, SENTIŌ “I feel, perceive” > *senço*, ARDEŌ “I burn” > *arço*. “Strong” verbs maintain the atonic *-i* of the first-person singular in the oldest texts—for example, STETĪ “I stood” > *estivi*, PŌTUĪ “I was able” > *pudi*—but by the beginning of the fourteenth century the reduction of atonic final vowels to a mid front vowel produced the standard ending *-e*. The Late Latin third-person singular ending *-u/-i* was often found as *-o*, alternating with zero (e.g., *fizo* vs. *fez*).

One distinctive feature of the Portuguese verb system was and is the “personal infinitive,” or what appears synchronically to be identical with the regular infinitive with certain personal endings added (e.g., *sem o sabermos* “without our knowing it”). One widely accepted theory perceives the origin of this form in the Latin imperfect subjunctive, which for the most part disappeared in Late Latin, replaced by the pluperfect subjunctive. Others have suggested an analogical source.

Galician became separated from Portuguese in the fourteenth century, preserving the apicoalveolar sibilant (known as the *geada*) also found in Castilian and distinct from the sibilant resulting from the simplification of the older affricates /ts, dz/. Standard Portuguese has been based for the most part on the central forms of the language found from Coimbra south, while Galician has undergone a massive influence of Castilian, both in pronunciation and in vocabulary.

GALAICO-PORTUGUESE LYRIC POETRY

Whether Portuguese literature today—with its offshoots in Brazil and the five Portuguese-speaking African countries—should be considered the most nearly major of the minor literatures or the most nearly minor of the major ones is a moot point. Old Portuguese poetry, at least from the late eleventh century to the early

fourteenth, was unrivaled in an Italy as yet without Petrarch, a France without Villon or Ronsard, an England without Chaucer, and a Spain with not one lyric poet whose name has survived.

The corpus of secular poetry in Old Portuguese (or Galaico-Portuguese, the languages of Portugal and Galicia not having diverged until after the period concerned) consists of some 1,680 songs, preserved in the *Cancioneiro da Ajuda*, in Lisbon; the *Cancioneiro da Vaticana*; and the *Cancionero da Biblioteca nacional*, Lisbon—the last two compiled in Italy some two hundred years later (available in 1973 and 1982 facsimile editions, respectively). Such was the prestige of these songs that Castilians, Leonese, Aragonese, Catalan, and even Italian poets tried their hand at composing them; among Castilians, Alfonso X complemented the troubadours' secular output by organizing a collection of 420 devotional *Cantigas de Santa María*, many presumably his own.

The secular poetry is conventionally and not altogether satisfactorily grouped under the three main headings of *cantigas de amigo*, *cantigas de amor*, and *cantigas de escarnho e mal dizer*, or flytings. The last are of chiefly psychological interest for their virulent misogyny and the coarsely explicit sexual insults the poets exchange, in contrast to the courtly elegance of their Provençal-inspired love songs and the tenderness and delicacy of the *cantigas de amigo*. If the former are of particular significance for the literary historian, they are by no means so devoid of genuine poetic interest as their relative neglect in favor of the latter might suggest.

The neglect is forgivable: the charm and freshness of the *cantigas de amigo* make them immediately accessible and attractive to modern sensibilities, and many of them are among the most captivating lyrics written anywhere in the Middle Ages. Subgenres include locally acclimatized forms of the general European pastorel, aubade, dance song, and barcarole, plus the indigenous pilgrimage song, all but the first being typically attributed wholly or in part to a female speaker addressing, referring to, or conversing with a lover, and all deriving from a convergence of Provençal influence with a native folk-song tradition of great antiquity and probably ritual origins. While the songs in their present form are the work of sophisticated poets, it is the latter strand that accounts for both the mysterious and hieratic atmosphere and the parallelistic form of the loveliest of them; the potentialities of the immemorial and universal device of parallelism, indeed, were arguably developed with more subtlety and ingenuity by these poets than by any before or since. Even the *cantiga de amor*, though heavily indebted to Provence, retains traces of the indigenous

tradition, and its practitioners do not doubt their superiority to their more cerebral mentors in emotional intensity, if not in the intellectual convolutions of *canso* (a type of song) and *trobar clus* (a type of obscure poetry).

What is most notable about the *cantiga de amigo*, however, is not its comparably convoluted parallelism. Dante ascribed the origin of vernacular poetry to one poet's wish to be understood by a lady to whom "era malagevole ad intendere i versi latini" ["Latin verses were difficult to understand"]: the great innovation of the *cantiga de amigo* lies in the engagement of some hundred poets, for almost a century and a half, in the common enterprise of trying to imagine what such a *donna* might say if she herself were writing the verses: perhaps the first example (outside China, where such songs proliferated in the fifth and sixth centuries) of a concerted and persistent effort to break out of the prison of the self, experienced as a gender-specific identity.

Of the 153 poets of the *Cancioneiros* only a few can be named here: the Villonesque Bernal de Bonaval; Garcia de Guilhade, ironic and innovative; Fernández Torneol, author of one of the most magically perfect aubades ever written; the proto-Freudians Portocarrero and Pero Meogo, singer of phallic stags, symbolic fountains, and dresses torn in the dance, who would surely rank as one of the major poets of the Middle Ages if more than nine of his songs had survived. Others, the number of whose extant works is in inverse proportion to their quality, are the barcarole poets Meendinho, whose one poem some consider the finest *cantiga de amigo* of all, and Martim Códax, the music of six of whose seven "sea chanties," exceptionally, has survived, as has that of King Alfonso's Marian *cantigas*. Gómez Charinho, a Galician admiral in Alfonso's service, depicts his mistress longing to go with him on campaign against the Moors but later rejoicing at his dismissal from his post, since now she no longer need fear for those in peril on the sea. Ayra Núñez, a fine poet and worldly priest "in Galice at Seint-Jame" a century before the Wife of Bath made her pilgrimage there, wrote delicious and ingeniously crafted dance songs and pastorales.

The poet with the largest number (138) of extant songs is Dinis, the sixth king of Portugal. Survival value here was clearly not dictated by hierarchy alone: the poet-king was also famous for a farsighted afforestation scheme whose vestiges may still be seen near Leiria.

GALICIA

Today, the word *Galicia* designates the territory, in the northwestern corner of the Iberian Peninsula, that is bounded by the Atlantic Ocean, the Cantabrian Sea, the Galaicodurian Massif and the lower reaches of the River Miño. This territorial and social entity is a creation of the middle centuries of the medieval period. Before this time, according to the *Abledan Chronicle* and the two versions of the *Chronicle* of Alfonso II, Galicia was a much larger territory extending as far south as the Duero River valley. This *provincia* or *urbs Gallecie* remained as the successor-state to the *Gallaecia* established by the late-Roman administrative reform of Diocletian and of the *Gallaecia* occupied by the Sueves and subsequently incorporated into the Visigothic kingdom. As late as the eleventh century, the realm inherited by García, son of Fernando I, was still the old *Gallaecia*, expanded by the lands recaptured—or expected to be recaptured—from the Moors. The old territorial notion still persisted when Alfonso VI bestowed the countship of Galicia on Raymond of Burgundy. Five years later, however, the county of Portugal was to be separated from Galicia and, under Count Henriques and Countess Teresa, to begin its path toward independence; and by the beginning of the XIIIth century, when the *Historia Compostelana* was written, Galicia was the Galicia of today, the lower reaches of the river Miño having acquired their definitive frontier character: *fluvius enim iste Portugalensem terram disternat a Gallaetia*.

The earlier, wider conception of Galicia is, as a survival of the era initiated by the Roman conquest, typical of the high medieval period between the eighth and eleventh centuries in areas like Galicia, where the effects of the Islamic invasion did not involve an abrupt break with preceding developments. The most remarkable and renowned event in high medieval Galician history—the discovery of the tomb of St. James the Great—is certainly related to such survivals; specifically, to the tradition that, since the seventh century, had represented St. James as the direct promotor of Christianity in Hispania. It is awareness of this tradi-

tion by the clergy of the never-abandoned see of Iria that can explain the attribution immediately made of the early-ninth-century discovery. The medium- and long-term consequences of this—the pilgrimages and the *Camino de Santiago*—were momentous. In the short term, the presence of the Asturian monarch Alfonso II and the protection he afforded to what was to become Compostela served to consolidate the incorporation of Galicia into the northern kingdom. This meant that just as Alfonso was formulating his neo-Visigothic program a territory was incorporated that shared with the lands to the north of the Cantabrian *cordillera* a virtual lack of Islamic influence, but which, unlike the latter region, had experienced relatively intense Roman and Germanic transformations.

Features characteristic of earlier times also manifested themselves in the social patterns of the Galicia of the ninth and tenth centuries, as evidenced by written sources, which at this time began to provide information about the fabric of society. These persistent traits are quite clear, ranging from the spatial distribution of the population—the basic unit is the *villa*, the small hamlet that had replaced the ancient hill forts in a process begun with the Roman conquest—to the pattern of social stratification characterized by the presence of a large serf population, a still significant number of land-holding peasants, and an aristocratic elite devoted to the expansion of the kingdom under the direction of the monarch, to ecclesiastical habits—such as territorial organization in parishes and monasteries inherited from the Germanic period.

This older pattern began to break up in the mid-twelfth century, being replaced by an idiosyncratic form of feudalism. Both internal and external factors were responsible for this change. Ranking high among the latter was the surge in pilgrimages, which made Santiago a center of incessant activity characterized on the one hand by its dynamic civic life and on the other by the growing prestige of the episcopal see eventually raised to metropolitan status thanks to the efforts of Diego Gelmírez.

The rise of the pilgrim route to Compostela, which connected Galicia with the rest of the Castilian-Leonese kingdom and, further afield, with the centers of western Christendom, combined with internal trends—demographic growth, intensification of agricultural activity, the spread of urban nuclei—in driving overall social change; but the specific social forms that arose were also influenced by political factors. After the twelfth century, Galicia lost the relatively central position it had held in the Castilian-Leonese kingdom. Portuguese independence, the reunification

of Castile and León in the thirteenth century and finally the rapid advance of the Reconquest led to the centers of power moving away from Galicia and to a reduction in its contribution to the repopulation of the regained territories. The adverse effects of the new situation seem to have been felt most by the lay nobility. The result of it all was the establishment of a feudal society whose chief features were the reduction in the number of small holders and their replacement by a dependent peasantry; the concomitant concentration of property, largely to the benefit of ecclesiastical institutions, Benedictine and Cistercian monasteries especially; and the division of power between the monarchy and other social groups, which favored the clerical sector—the principal recipients of jurisdictional suzerainties, from the Tierra de Santiago to monastic fiefs—at the expense of lay nobility and citizenry, whose power was limited following the abortive anti-episcopal revolts of 1117 and 1137 in Compostela.

The contradictions in the social structure were to be highlighted by the late medieval crisis. The new nobility that emerged from the Trastámaran civil war, lacking a solid financial basis, sustained its social position by the abuse of power. The reaction of the citizenry and peasantry against such abuse came to a head in the Irmandiño Revolt of 1466–1469. Yet neither the revolt nor the short-lived triumph of the nobility (immediately emptied of content by the centralizing policies of the Catholic Monarchs) gave rise to significant changes in the social system established in the preceding centuries. Rather, one is led to the conclusion that the crises of the fourteenth century and the conflicts of the fifteenth were shake-ups that helped to consolidate its basic features for a long time to come.

GALÍNDEZ DE CARVAJAL, LORENZO

Royal secretary, historian, and editor, Galíndez was born in Plasencia on 23 December 1472 and died around 1530. The illegitimate son of an archdeacon of Coria (later legitimized), he took his mother's family name first and his father's second. He read law at Salamanca University and later occupied a chair there. He married Beatriz Dávila, daughter of Pedro, *señor de las Navas*. In 1499 Galíndez was named judge on the Valladolid circuit, and three years later was promoted to the Royal Council. He was awarded the degree of Doctor of Laws in 1503, and at the relatively young age of thirty-one had so gained the confidence of Queen Isabel that she asked him to be present when she drew up her will. His first task as a civil servant was to list the laws and ordinances of all previous monarchs, a laborious work that was never published; it was also said that he had begun a collation of the *Partidas*. Galíndez accompanied the Catholic Monarchs through the main events of their reign, and on Fernando's death in 1516 was appointed to go and meet the new king, Carlos I, at Aguilar de Campóo; for Carlos's guidance he prepared an *Informe sobre los miembros del Consejo Real*. We know little of his activities in the last years of his life; it is assumed he retired to his native city about 1525.

Posterity remembers Galíndez not as a civil servant or a legal adviser but as a historian, an editor of historical texts, and an early critic of historiography, acutely aware of the partisanship of his near contemporaries. He compiled two genealogical monographs, but more significant was his *Memorial o registro breve*, an annual itinerary of the Catholic Monarchs from 1468 to 1516. He prefaced this with the first extensive set of observations on the problems and aims of official historians, which, according to some, was a prelude to a history of Spain or at least of the Catholic Monarchs. At Fernando's request he had been collecting and revising manuscripts of major chronicles past and contemporary, at least from Pedro López de Ayala onward. Whatever his intentions, only one was published, that of Juan II of Castile (Logroño, 1517). He also added four biographies to the *Generaciones* of Fernán Pérez de Guzmán, revised a copy of Hernando del Pulgar's *Crónica de los reyes católicos*, which he gave to Antonio de Nebrija to adapt and translate as the *Decades duae*. He also revised Diego Enríquez del Castillo's chronicle of Enrique IV and Diego de Val-

era's *Memorial de diversas hazañas*, and possibly commissioned the work of Lucio Marineo Sículo.

GAMA, VASCO DA

Vasco da Gama was born about 1460 in Sines. He was the son of Estevão da Gama, a minor noble who had fought in North Africa and later became admiral of Portugal and governor of Sines.

The rounding of the Cape of Good Hope by Bartolomeu Dias in 1488 had confirmed the existence of a sea route from western Europe to Asia; consequently King Manuel I of Portugal ordered another, larger expedition and put the young Vasco de Gama in command of it. His fleet consisted of four ships: two *naus*, the *São Gabriel*, captained by Gama himself, and the *São Rafael*, captained by his brother Paulo; the *Bérrio*,

a smaller ship, probably a caravel, captained by Nicolau Coelho; and a large supply ship captained by Gonçalo Nunes. The number of sailors and soldiers who took ship on Gama's first voyage was between 150 and 200 men.

Gama sailed out of the Tagus on 8 July 1497. He reprovisioned in the Cape Verde Islands, leaving there on 3 August and heading southwest to avoid the doldrums. Like Dias he picked up the westerlies and, turning east, made his first South African landfall at Saint Helena Bay on 7 or 8 November. He rounded the Cape of Good Hope on 22 November and anchored in Mossel Bay. Having abandoned his supply ship and redistributed its remaining provisions, he sailed on, reaching the Great Fish River on 16 December. Soon thereafter he was at present-day Natal Point, so named by Gama because it was sighted on Christmas Day. He reached Quelimane on 24 January 1498, Mozambique Island on 2 March, Mombasa on 7 April, and Malindi on 13 April. Favorably received there by the sultan, who liberally resupplied him, Gama set out to cross the Indian Ocean on 24 April. He was able to profit from the southwest summer monsoon wind, which took him to India in under a month. By 20 May he was anchored off the Malabar coast just above Calicut. The *samorin* of Calicut received him coldly, and at one point held Gama and his retinue prisoner. By a judicious mixture of threats and astuteness, Gama extricated his fleet and left India at the end of August 1498.

The return journey was disastrous: he was obliged to burn Paulo's ship for lack of men to sail her, for many had died of scurvy and dysentery; Paulo died on Ilha Terceira in the Azores. Gama arrived in Lisbon at the beginning of September and was rewarded magnificently by Manuel I with three pensions, the admiralty of India, and, much later, the countship of Vidigueira.

In 1502 Gama made his second exploratory expedition with a fleet of twenty ships that bombarded Calicut and left a five-warship guard at the entrance of the Red Sea to thwart Muslim trading competition. He also cemented an alliance with the more friendly Malabar state of Cochin. He returned briefly to India as viceroy of Portuguese India in 1524, dying there at the close of that year.

Vasco da Gama's achievement cannot be overestimated: he circumnavigated the African continent, directly linking the Indian Ocean with Europe, and he effectively sent into economic and political decline the powers of the eastern Mediterranean (Venice, Genoa, Egypt, and Turkey) so that economic power would shift permanently to the Atlantic. The consequent European dominance of western Asiatic waters was to continue until 1941–1942, when the Japanese over-

threw British, French, and Dutch power; thus some Indian historians still call the period 1497–1941 “the Vasco de Gama era” of Indian history.

GAMES AND GAMBLING

The gloomier moments of medieval life were partially brightened by an array of games and other diversions. Ranging from the silly to the sedate, from the physical to the cerebral, these entertainments had broad appeal to a highly stratified society. Some of these activities parallel modern spectator sports: French-inspired tournaments, for example, played to leisure-class audiences. More plebeian sports included ball games, such as handball and a forerunner of baseball, the latter depicted in the thirteenth-century *Cantigas de Santa María* (cantiga 42).

Sedentary players preferred chess and backgammon, both of which formed part of the Oriental culture brought by the Muslims to Christian Europe. The lavishly illustrated *Libro de acedrex, dados e tablas*, commissioned by the polymath Alfonso X the Learned, appeared in 1283 and was the most elaborate medieval treatise on these games. Two centuries later Luis de

Lucena coupled the games of love and chess in his *Repetición de amores y arte de ajedrez*. Of all the instruments of play, dice possessed the oldest, if hardly the most illustrious, pedigree. Playing cards, on the other hand, did not arrive at the Iberian Peninsula until about 1375, having first appeared in Italy. The advent of printing a century later ensured that playing cards would enjoy accurate reproduction and widespread distribution.

Gambling, that raffish progeny of innocuous games, likewise played a prominent role in medieval pastimes. Adaptability was gambling's virtue, since any game could be transformed by the addition of a wager, just as any locale could become an informal gambling den. Numerous references to Christian, Muslim, Jewish, women, clerical, and student players testify to the general allure of gambling. Although church and state sought to limit gambling in an effort to preserve social order and prevent moral decay, their injunctions often proved ineffective. Indeed, recognizing the material gain that would accrue to the royal fisc, Alfonso X, the putative author of the *Ordenamiento de las tafurerias*, sought to establish a monopoly on organized gambling.

GARCÍA DE SALAZAR, LOPE

Lope García de Salazar (1399–1476) was a Basque nobleman best known for a vast compilation, the *Libro de las bienandanzas e fortunas*, written between 1471 and 1476 while he was held prisoner by two of his sons. Earlier, in 1454, he had compiled a shorter work, the *Crónica de Vizcaya*. The *Bienandanzas* consists of twenty-five books, the last six treating northern Spain, particularly Salazar's native Vizcaya. Salazar's stated purpose was to preserve knowledge of the past for future generations. For his history of Spain and other countries and peoples, he favored a genealogical approach, tracing the rise and fall of leading figures, summarizing and often copying verbatim texts from his own library, collected, he informs us, from various parts of Spain and abroad.

Twentieth-century scholars discovered in the *Bienandanzas e fortunas* a wealth of information on historiographical and literary texts, including some now

lost, as well as legends that circulated in northern Spain in the fifteenth century. In Salazar's books on the history of Spain, interest has focused principally on his use of epic material (*Roncesvalles*, *Fernán González*, the *Mocedades de Rodrigo*, etc.). Concerning other sections of the work, attention has been given to his use of the *Libro de buen amor* and the pseudo travel book attributed to the Infante Dom Pedro de Portugal (a work otherwise known only in later printings); a now lost Alexander prose romance, the *Poridat de las poridades*, and the Aristotle and Phyllis legend in his history of Greece; Trojan and Arthurian romance in his history of England; the Flores and Blancaflor romance and epic tales concerning Berta and Mainete in his history of France; a version of the Melusine romance and a story of the descent into hell in his history of Flanders; and the *Gran conquista de Ultramar*, including the *Caballero del Cisne*, in his history of the Crusades. Salazar frequently alters his written source with information derived from oral tradition, for example, an account told by English seamen of the passing of King Arthur to the Island of Brasil in his condensation of the post-Vulgate *Roman du Graal*.

GARCÍA DE SANTA MARÍA, ALVAR

Royal secretary and historian, García was born in Burgos about 1370, into an old Jewish family. His elder brother Solomon converted to Christianity under the name of Pablo de Santa María and led the rest of the family to be baptized around 1390. The family preserved and improved their social standing in the church and royal household as loyal servants of the crown. In 1400 García married Marina Méndez from Toledo; there was no issue, so he legitimized a natural daughter conceived before his marriage. He was introduced early to the court of the regent Fernando de Antequera and in 1408 was appointed to the royal scriptorium. In 1410 he was proclaimed by the regent as "noble ciudadano, regidor, secretario de su cámara, su coronista y consejero, libre de todo pecho" ["noble citizen, rector, secretary of his chamber, chronicler and coun-

selor, free of all taxes"]. When Fernando became king of Aragón in 1412, García briefly followed him there. After Fernando's death in 1416 he returned to Castile to continue in his position as royal chronicler until the 1450s, when, according to Alfonso de Palencia, he fell into disgrace. Following his death on 21 March 1460, he was buried in the main chapel of the monastery of San Juan, Burgos, where, according to Galíndez, manuscripts of his work were deposited.

Alvar is known to posterity as the main author of the *Crónica de don Juan II de Castilla*. According to Fernán Pérez de Guzmán, he was a "notable e discreto onbre que non le falleçería saber para ordenar e conçiençia para guardar la verdad" ["a notable, discreet man whose wisdom and conscience for keeping to the truth would never falter"] who was replaced as historian, with the result that the remainder of the history lacked authority. It is hard to decipher his contribution to the *Crónica*, given the difficulty of assessing authorship of the surviving manuscripts. Galíndez's opinion, as the text's first editor, was that Alvar had started in 1406 (with a gap of some ten years from where López de Ayala left off) and continued to 1420, when he left off. It was continued by another to 1435, and a third from after 1435 to the death of Juan II (1453); after this it was revised by Pérez de Guzmán, whose text Galíndez claimed to respect.

His views have not been totally accepted by modern critics in their examination of the three main manuscripts. But despite the observations of Cantera, Carriazo, Terracini and Donatello Ferro, the balance between original and *refacimenti* has not been totally worked out. The first volume of a "critical" text by Carriazo contains the bare text up to 1411 without any critical apparatus. Overall, the treatment is very traditional; the deliberate anonymity of the author echoes that of previous chronicles. Like Ayala he must have had access to official documents, probably assembled in annual registers before being gathered into a royal itinerary that forms the basis of the narrative. This narrative follows Fernando in the early part, then alternates between Juan II and Álvaro de Luna in the later part. Stylistically there is no great variation (until the last years) in expressive devices. One abiding characteristic is the detailed description of rituals. The chronicle marks the end of a long series.

GARCÍA DE SANTA MARÍA, GONZALO

García (b. 31 May 1447) was a grandson of Tomás García de Santa María of Zaragoza, a first cousin of Pablo de Santa María, *converso* bishop of Burgos, and son of Gonzalo de Santa María, also of *converso* (Christian convert) stock, merchant and moneylender of the same town. By training and profession he was a legal officer, serving as councillor to the chief justice of Aragón, Juan de Lanuza, and also to the governor of Aragón, Archbishop Alfonso de Aragón. He was involved in property and other deals that brought him into conflict with the law (1469). In 1499 he claimed that the servants of the viscount of Evol tried to assassinate him; no reason was given. Like many of his contemporaries, he had brushes with the Holy Office. The *Libro verde de Aragón* claims that the Inquisition had disciplined him and his wife, a Valencian *converso*, Violant de Bellviure.

García's small but choice library gives some measure of his cultural background. Most of the books are in manuscript form and in Latin, equally divided between law and letters. He does not give the titles of those in Greek and Romance, merely listing an important nucleus, including Diogenes Laertius's *Lives of the Philosophers* in an Italian hand, four treatises of Cicero, Trogus Pompeius, Virgil's *Aeneid*, Juvenal, and St. Jerome, plus two volumes of Lorenzo Valla's works. In his own words, he valued these books above all else. Despite his complaint that the new printing presses had lowered the price, he was still enthusiastic about this novelty, and worked for Paulus Hurus and his successors.

The bulk of García's work was translation of moral treatises into the vernacular. Although he regarded this as a laborious task, he had significant things to say about the art of translation and, before Antonio de Nebrija, about the connection between the spread of the mother tongue and political power. He also edited the corpus of Aragonese law (1494), the *Dialogus pro ecclesia contra sinagogam* (1497), and the synodal constitutions of the archbishopric of Zaragoza (1498). He also played some role, according to Fabricio de Vagad, in encouraging the latter to write his *Crónica de Aragón* (1497). We have data on three historical works in Latin related to the Crown of Aragón: a general history of Aragón, of which only fragments remain; a genealogical work whose aim was to secure and confirm the links between the Crown of Aragón and Castile; and an official Latin biography of Juan

II of Navarre and Aragón, commissioned by his son Fernando and inspired by Sallust's *Catiline Conspiracy*, which illustrates the triumph of the king over the rebellious Catalan patricians in the 1460s. It can be classified as the first true humanistic product of Iberian historiography. It was utilized, directly or indirectly, in the later works of Lucio Marineo Sículo on Aragonese history.

GAYA CIENCIA

Gaya Ciencia is a late medieval synonym for the art of composing troubadour poetry, probably coined by the Consistòri del Gai Saber, a bourgeois institution with academic pretensions founded at Toulouse in 1323, which aimed to promote a troubadour revival. Arnaut Vidal, the first winner in the May Day competition, was awarded a "doctorate in *gaya sciencia*" in 1324 for a poem ostensibly in praise of the Virgin Mary. This science is defined as "gay" because the joy of love (in Provençal, *joy*; adj. *gai*, fem. *gaia*) was a key concept in both Provençal and Arabic love poetry. Indeed, the word *trobar* itself almost certainly derives from the Arabic *taraba*, "to be moved by joy or grief; to sing, to play music." The Toulouse consistory commissioned a large treatise on Provençal grammar and poetics, *Las Flors del gay saber, estier dichas las leys d'amors* (1328–1337); one of the founders, Raimon de Cornet, wrote a *Doctrinal de trobar* in verse (1324).

This institution was fostered by Pere IV of Aragón after his annexation of Toulouse in 1344. His successor, Joan I, established a poetic academy in Barcelona in 1393, modeled on that of Toulouse. Jaume March (uncle of Ausiàs) and Lluís d'Aversó were appointed as *mantenedors* (overseers); both wrote theoretical works on poetry. There was also a Catalan version of *Las Flors del gay saber*. Learned vernacular culture was further encouraged by Martí I of Aragón: in 1396 he established a faculty of Limousin or Provençal at the University of Huesca, the earliest faculty of the modern humanities in Europe. The almost miraculous civilizing properties ascribed to the gay science by Joan I and Martí I are similar to those mentioned by Ibn Hazm, Guillaume IX, Raimbaut de Vaqueiras, Juan Ruiz, Rodrigo Cota, and others with reference to love: "purissimo, honesto, et curiali nitens eloquio, rudes erudit . . . cor laetificat, excitat mentem, sensum clarificat atque purgat." In 1413 Fernando de Antequera confirmed the concessions "pro gaya sciencia"

granted by his royal predecessors. Enrique de Aragón (also known as *de Villena*), a *mantenedor* of the Barcelona consistory, then wrote the earliest surviving treatise on poetry in Castilian. This fragmentary *arte de trovar*, addressed to the Marqués de Santillana, contains an eyewitness account of the solemn ritual of electing a poet laureate. Santillana, in turn, summarized his views on poetry in the preface to his collected verse, dedicated to Pedro, Constable of Portugal, in 1449. *Gaya sciencia* is here defined as a divinely inspired craving for perfection to which noble and perspicacious minds are susceptible.

The theory that to be technically proficient a poet requires both nobility and divine inspiration was expressed by Juan Alfonso de Baena in the preface of the *Cancionero*, which he compiled for Juan II of Castile in 1445: “el arte de la poetrya e gaya çiençia es una escriptura e conpusyçion muy sotil e byen graçiosa . . . alcançada por graçia infusa del señor Dios”; the practitioner of this science must be courtly, amorous, and of noble birth: “que sea noble fydalgo e cortes e mesurado . . . que sea amador e que siempre se preçie e se finja de ser enamorado.” This antibourgeois definition of *gaya ciencia* was espoused by the impoverished *hidalgo* Alvarez de Villasandino in his hostility to the learned school of Imperial. It was thus that Provençal poetics, in a modified form, influenced the Castilian courtly lyric. One of the last theoretical works in this tradition was a Castilian rhyming dictionary, *La gaya ciencia*, compiled (ca. 1474–1779) for Alfonso Carrillo, Archbishop of Toledo, by Pero Guillén de Segovia.

GELMÍREZ, DIEGO, ARCHBISHOP OF COMPOSTELA

This most famous and most powerful ordinary of the shrine of Santiago de Compostela was a native of Galicia, born about 1070 into a family of the minor nobility of that province. He probably was educated in part at the court of Alfonso VI (1065–1109) of León-Castile and in part within the clerical community of the cathe-

dral. In 1090, and again in 1096, Gelmírez was the royal administrator for the possessions of the then vacant see of Compostela. In 1094 he had become the notary of Count Raymond of Galicia (1090–1107), originally from Burgundy, who held the province by virtue of his marriage to Urraca, daughter of King Alfonso. The choice of both king and count, Gelmírez was elected bishop of Compostela perhaps as early as 1098, and certainly by 1100. He was consecrated on 21 April 1101. The see to which he succeeded had been famous since the ninth century as the shrine-church purportedly housing the relics of the apostle St. James the Great. As the only site of apostolic remains in the Western world except Rome, it had long been the destination of pilgrims. In 1095 Pope Urban II had approved the exemption of the see from its traditional metropolitan, Portuguese Braga, and made it directly dependent on Rome.

Gelmírez's major triumph was to secure the transfer of the former metropolitanate of Visigothic Mérida to Compostela by Pope Calixtus II in 1120. As a result Compostela immediately became the metropolitan see for Ávila, Salamanca, and Coimbra, and Gelmírez, an archbishop. The suffragan see of Coimbra finally could not be retained, but in the long rivalry for power that ensued, Compostela ultimately wrested the Galician sees of Túy, Lugo, Mondoñedo, and Orense away from Braga.

In addition Gelmírez had been named papal legate for the ecclesiastical provinces of both Braga and Mérida by Calixtus II, and used his power for the aggrandizement of his own church. He also hoped to have Compostela replace Toledo as the primatial see of Iberia, but fell short of his goal. He was also an energetic reformer of the church and cathedral chapter of Santiago de Compostela, and carried out much of the construction of a major new Romanesque cathedral there, begun a quarter of a century earlier.

Gelmírez was also a major political figure of the realm of León–Castile. He was guardian, along with the Galician magnate Count Pedro of Traba, of the only son of Count Raymond and Alfonso VI's daughter, Urraca. When Urraca succeeded to her father's realm in 1109 and married King Alfonso I of Aragón (r. 1105–1134), Gelmírez and Pedro raised a revolt against the royal couple in the name of the rights of the future Alfonso VII. The Galician prelate was sometimes the soul of the opposition to Queen Urraca and sometimes, particularly after her separation from Alfonso in 1112, her close collaborator. With the death of Urraca in 1126 and the succession of her son as Alfonso VII (r. 1126–1157), Gelmírez initially shared the glory of his former protégé. At the Council of León

in 1130 he was able to place canons of his church in the bishoprics of the royal city of León and of Salamanca. Three years later another canon of Compostela became bishop of Orense.

But royal favor was inconstant, and as early as 1127 Gelmírez found himself the subject of extortion at the hands of a needy Alfonso VII. After 1134 the archbishop was increasingly eclipsed by the rising influence of the archbishop of Toledo, who placed his own canons as royal chancellor and then in Compostela's suffragan see of Salamanca in 1135. The following year the king collaborated in an attempt to have Gelmírez removed from his ecclesiastical dignity. At the Council of Burgos in 1136 the Galician prelate was rescued only by the support of the papacy and the ineptitude of the conspirators. Nevertheless, the cost of maintaining his office again came at the price of substantial future subsidies to the king.

The troubles of the archbishop of Santiago de Compostela were, in good part, due to his position as one of the great magnates of Galicia as well as a prelate there. His office made him the administrator of widespread royal lands, and these, combined with the lands of the shrine—church itself, automatically established him as the most powerful figure of central Galicia. There he was caught between the ambitions of the Trastámara counts of Traba in the north and of the monarchs Teresa (r. 1112–1128) and Afonso I Enríques (r. 1139–1185) of Portugal in the south.

By royal grant and policy Gelmírez was also the lessee of the royal mint in Compostela and the city's civil administrator. In the latter capacity he resisted the ambitions of a nascent citizen commune to a share in the government of the town, although he did grant a measure of participation to it. The communal movement had allies even within the cathedral chapter. When his troubles in the larger political arena became acute, he faced outright revolt in 1117 and again in 1135. Both began with unsuccessful attempts on his life that failed only by the narrowest of margins. In each case the crown had initially encouraged Gelmírez's enemies, and repudiated them only when their attempt at assassination had failed.

After 1136 Gelmírez played only a small part in the life of the realm, and his activities in the church seem to have tapered down as well. From 1138 he was probably intermittently ill, and he died on 31 March 1140.

GENERAL ESTORIA See ALFONSO X, KING OF CASTILE; ILLUMINATION

GENERALITAT

The Generalitat originally an ad hoc, temporary administrative delegation from the *corts* (parliaments) of Catalonia called the *Diputació del General*, had evolved by the end of the Middle Ages into an important governing body. The *Diputació* appeared first in Catalonia in the mid-fourteenth century, and by example it was extended to Aragón and Valencia in the early fifteenth century, and into Navarre roughly fifty years later.

The original function of the *Diputació del General* was to supervise the implementation of acts voted on in the *corts*, especially those concerned with fiscal collection and anything connected to the privileges of Catalonia. The mandate of its authority initially was limited to the period between meetings of the *corts*. In 1359 Pedro IV (r. 1336–1387) granted this ad hoc commission a permanent status to the *Diputació del General*, composed of three representatives, or *diputats del general*, one from each of the three estates of the *corts* and elected by the members of the *corts*. The representative from the ecclesiastical estate presided over the *Diputació*. Local *diputats*, whose number varied considerably, represented the *Diputació* in the principal cities. All *diputats* received a salary, and an audit was conducted every three years in an attempt to limit fraud. The *Diputació* resided permanently in Barcelona.

By 1365 the *Diputació's* jurisdiction was extended to include the counties of Roselló and Cerdania. In 1413 Fernando I of Antequera, in recognition of the growing importance of the *Diputació*, created three additional *diputats*, the *oidors de comptes*, who were directly responsible for finances. All *diputats*, both local as well as the *Diputació del General*, were limited to a three-year term, but successors were appointed by the incumbents, thus creating an influential, closely held oligarchy. Within a few years the *Diputació* had become an administrative body with a status roughly equivalent to that of the royal court.

Although as an institution the *Diputació* had grown in prestige and influence, during the fifteenth century the membership began to change, reflecting new social and political alignments and weakening its oligarchical nature. In 1454 a bloc of newly influential

artisans and merchants in Barcelona protested the selection procedures. Alfonso V (r. 1416–1458) responded with an order that all future elections be a mixture of election and lottery; by 1493 all elections were by lottery only.

The Diputació was immensely valuable to the king in terms of collection of sums approved by the *corts*, and to the Catalans themselves as a guardian of traditional liberties and privileges. By the mid-fifteenth century, however, it no longer was simply on a par with royal governing bodies—it had become a potent counterbalance to royal authority. During the 1440s and 1450s, after decades of increasingly violent unrest in the countryside, Alfonso V decided to liberate the *remenses*, peasants in northeast Catalonia who were bound to their secular and ecclesiastical lords under harsh servile conditions. The *diputats*, landholders whose economic and political interests were seriously threatened by Alfonso's decision, argued that the order was contrary to the traditional liberties of Catalonia and fiercely opposed the action. Led by the archbishop of Tarragona, the *diputats* allied with Barcelona's town council, the Consell de Cent, and forced Alfonso to revoke his order.

The conflict continued during the reign of Juan II (1458–1479), and once again royal prerogative was challenged by the Diputació, and not just with respect to the *remenses*. In 1460, when Juan ordered the arrest of his son, the popular Carlos of Viana, on charges of treason, the *cort* immediately denounced it as contrary to the privileges of Catalonia, and before disbanding, granted emergency powers to the Diputació. Joining with other factions from Barcelona in defiance of Juan, and with support from throughout the other crown realms, in 1461 the Diputació forced Juan to sign the Capitulation of Vilafranca, which recognized Carlos as the legitimate heir. It was an unambiguous victory of the Catalans as well as a demonstration of the immense power of the Diputació. In the civil war that followed (1462–1472), the Diputació maintained its defiance of the king until the end, when royalist forces besieged Barcelona and forced a negotiated settlement. Its political power dwindled progressively after the union of Castile and Aragón in 1479, its function limited to administration under the dominance of the government of Madrid.

GERMANIC INVASIONS

The origins of the movements of population that often are called the Germanic invasions are not easy to determine, largely because most of the literary evidence relating to them is Roman in origin, and is limited in quantity, especially for what appear to be some of the more crucial periods. In general, Roman authors, whose sense of the cultural superiority of their own civilization in relation to that of the "barbarians" beyond the frontiers was highly developed, were not interested in investigating or providing their readers with details of the social organization and value systems of such alien societies.

However, contrary to old stereotypes, it should not be imagined that the Germanic societies beyond the imperial frontiers, roughly represented by the Rhine and Danube Rivers, were constantly pressing on those barriers, anxious to break into the empire and establish themselves on Roman soil. Their own societies, if more fissile than that of Rome, were normally stable, and they possessed traditional lands of their own. Moreover, a mutually beneficial relationship of trade and employment existed between the empire and its neighbors. Increasingly during the late Roman Empire, groups and individuals were recruited from among the Germanic peoples beyond the frontiers to serve Rome's military needs. In such ways, as well as in trade, elements of the material culture of the Roman Empire came to be established among the Germans.

By the late fourth century, other than in language, there was little to distinguish the Germans from the inhabitants of the frontier provinces of the empire. The causes of the breakdown of this relatively stable set of relationships and the period of upheaval that marked most of the fifth century are not easily determined. Ecological changes in the vast region stretching north from the Danube and around the top of the Black Sea precipitated the disintegration of the dominant Gothic societies in that area, and this in turn seems to have had a slightly delayed effect on the smaller ethnic groups facing the empire along the Rhine.

In the East the first manifestation was the flight of those who were to re-form themselves into the confederacy of the Visigoths toward the imperial frontiers and their crossing into Roman territory in 376. In the West the freezing of the Rhine in the winter of 406

allowed a racially mixed alliance of three smaller confederacies to cross the river on 31 December and enter Gaul. The four groups involved—the Hasding and Siling Vandals, the Alans, and the Suevi—moved across Gaul from a point in the Central Rhine Valley near Mainz, causing the breakdown of local order and ravaging the countryside through which they passed. Being in movement, they could support themselves only from what they could take, and needed security before they could reestablish themselves as economically self-supporting communities.

On the other hand, they were forced to continue moving, in that their needs for food and maintenance could be met only by finding new victims. Thus, in September or October 409 they reached the Pyrenees, and were able to cross into Spain, either through the negligence or with the deliberate assistance of the imperial troops defending the passes. Once in the peninsula, following a further period of movement and depredation, it became possible for them to establish themselves in the role previously played by the Roman army. A treaty made with the regime of the rebel emperor Maximus may have been the cause of this. The Alans and Siling Vandals settled in the southern provinces while the Hasding Vandals and Suevi occupied the former imperial military zone in the northwest. It may be assumed that they established themselves as garrisons in the major towns, and received pay and supplies from the local administrations.

The treaty made with Maximus was not recognized by the legitimate imperial government, which attempted to remove these unwanted peoples and regain its tax revenues. In 416 the Visigoths, led by Wallia, were employed by Emperor Honorius (r. 395–423) to carry out this task. They destroyed the Alan and Siling Vandal confederacies but had to be recalled to Gaul in 418 when it seemed likely that they were planning to move on to the wealthy but poorly defended African provinces. This, however, was achieved in 429 by the Hasding Vandals. Their removal to North Africa left the Suevi as the dominant military force in the Iberian Peninsula, and they established control over most of it, other than the northeast, with a capital at Mérida.

A renewed military alliance in 456 between the Visigoths and the imperial government, now dominated by a soldier of mixed Visigothic and Suevic origin named Flavius Ricimer, involved a further invasion of Spain. The Visigoths under Theoderic II (r. 453–466) crossed the Pyrenees and destroyed the Suevic kingdom in the south of the peninsula. A small version of it was reconstructed in the northwest, and

survived until absorbed into the Visigothic kingdom of Leovigild in 584. The year 456, though, may be said to date the establishment of continuous Visigothic rule over the greater part of Spain.

GERONA (GIRONA), CITY OF

Gerona (in Catalan, Girona) is situated on relatively high ground in the valley of the Ter River between the small Onyar, Güell, and Galligants streams. It controlled the main route from Barcelona into the Midi and is at the center of a rich agricultural region, and was besieged on many occasions.

Gerona was a fortified place on the Roman Via Augusta. Settlement centered around what is now the cathedral, the Gironella tower, and the Church of St. Feliu. In the late fourth century, when the poet Prudentius wrote his *Crowns of Martyrdom*, devotion was already centered on the martyr Felix. A collegiate church built in his honor, along with the cathedral, were the oldest ecclesiastical foundations. Gerona was an episcopal see from at least the fifth century, and this status, as well as the relics of St. Felix and the town's strategic position, assured its survival during the Visigothic era.

The Muslim occupation lasted from about 715 until 785, when the citizens delivered the city to Frankish forces. Gerona was thus the first substantial permanent conquest of Charlemagne's forces (Barcelona would fall sixteen years later). Charlemagne was revered in Gerona and worshiped as a saint in the late Middle Ages.

Gerona was the center of a county and a diocese in the Carolingian Empire. Although controlled at times by the counts of Cerdània-Besalú, by the eleventh century Gerona was firmly in the hands of the counts of Barcelona and was closely identified with the fortunes of Ermessenda, wife of Ramón Borrell and regent for many years after his death. A Romanesque cathedral was consecrated in 1038 (of which the bell

tower remains, visible only from within the cloister). A Gothic structure was erected in the fourteenth century. The cathedral contains the largest single nave among medieval Iberian churches.

The population and prosperity of the town grew in the twelfth and thirteenth century. A municipal government of six (later four) *jurats* and a council of eighty was reformed in the fifteenth century to assure a less oligarchical system of election and political control. A Jewish population of perhaps 500 flourished until the late fourteenth century.

Before the Black Death of 1348, Gerona was the second most populous town in Catalonia. Its population may have approached 10,000 and certainly surpassed 8,000. The mortality figure from the first great epidemic was about 15 percent, but the decline in population continued throughout most of the late fourteenth and fifteenth centuries. In 1497 Gerona had 4,750 inhabitants.

Gerona suffered greatly during the civil war of 1462–1472. Its sympathies lay with the Generalitat of Catalonia and the citizens of Barcelona who opposed King Juan II. Nevertheless, at the opening of the war, Queen Juana Enríquez and her son (the future Fernando II of Aragón) withstood a siege of Gerona by an army of the rebels led by the count of Pallars until the invading forces of Louis XI of France came to her aid. Other sieges occurred place in 1463 and 1467, and Gerona changed hands more than once during the war.

GERONA, COUNCIL OF

An important early provincial church council, the Gerona meeting in June 517 promulgated legislation concerning liturgy, baptism, and clerical celibacy. It took place at a time when the Visigothic rulers, who were Arians, tolerated Catholicism and allowed contacts with the papacy.

The Council of Gerona was presided over by Juan, Archbishop of Tarragona. It followed a council in Tarragona that had taken place in 516 and represented an attempt to institute regular provincial gatherings. In attendance were six of the suffragans of the metropoli-

tan: Frontinianus of Gerona, Paul of Ampurias (a see that would not survive the Muslim period), Agrippius of Barcelona, Nibridius of Egara (another later-to-be-abandoned see), Orontius of Lérida, and Cynidius of Ausona (later Vic).

The second and third canons established two series of Rogation Days, periods of fasting and prayer from the Thursday to the Saturday after Pentecost and on the three days beginning on November 1. This followed a practice first attested in the province of Vienne, but antedated acceptance by Rome (which would take place under Gregory I the Great) and the church as a whole.

The power of the archbishop of a province to set a standard liturgy for all suffragen churches was recognized by the first canon. Another step toward liturgical uniformity was to require recitation of the Lord's Prayer after matins and vespers (canon 10). These two liturgical provisions would be cited in the *Decretum* of Gratian in the twelfth century (*De consecratione*, dist. IV, c. 15 and dist. V, c. 14, respectively).

In the early church, baptism was performed only at Easter. A century after the beginning of the Pelagian controversy, the Gerona Council upheld and extended the practice of infant baptism by requiring immediate baptism of sick newborns. This canon (canon 5) went against Pelagian opposition to infant baptism and the notion of original sin. An adult Christian not yet baptized (catechumen), less common by 517 than in earlier centuries, was to be baptized on Easter or Christmas, but here, too, exception was to be made for the sick (canon 4).

The most significant conciliar acts for the later history of the church were those concerning clerical discipline and admission to clerical office. Married men entering holy orders at the level of subdeacon or above were encouraged to live separately from their wives (canon 6). Unmarried clergy were not to entrust their household to women not related to them (canon 7). Men who married widows or divorced women were barred from holy orders (canon 8, cited in *Decretum*, dist. XXXIV, c. 8). Rules on the admission of penitents to orders were defined according to the severity of their offense and the type of penance performed (canons 9 and 9bis).

GERSONIDES See LEVI IBN GERSHOM

GESTA COMITUM BARCINONENSIIUM

Catalan historiography of the Reconquest began in the twelfth century in such ecclesiastical centers as Cuixá, Ripoll, and La Roda. It took the form of short monastic annals in Latin linked primarily with French rather than universal or Hispanic history. The annals are calendrical, studded with historical events but possessing a meagre organic structure. The first formally conscious chronicle of Catalan history, the *Gesta comitum* originated in the monastery of Santa María de Ripoll in various versions that eventually included the early kings of Aragón. The earliest Latin version is structured around the legend of Count Wilfred the Hairy (Guifré el Pelós) and the origins of the counties of Barcelona, Urgell, Besalú, and Cerdanya and covers the period up to the death of Ramón Berenguer IV (1162). It was written by the same author in three stages and completed between 1162 and 1184. A first addition containing the kings of Aragón corresponds to the reign of Alfonso I (1103–1134), written probably between 1200 and 1208; a second contains the reigns of Pedro II (1196–1213) and the minority of Jaime I, which can be dated 1214–1218, and a conclusion covering almost all the reign of the latter (1214–1276), ascribed to 1270–1275.

An intermediate version—based on the earliest text, with additions from the *Chronicones Rivipullenses*, the eulogy of the Abbot Oliba of Ripoll, the *Brevis historia monasterii Rivipullensis* and Rodrigo Jiménez de Rada's *Historia gothica*—was finished between 1268 and 1270. This was the basis of a Catalan version, slightly abbreviated, datable to 1268–1283. The definitive version derives from the intermediate, extended up to 1299 by a very detailed narrative and completed between 1304 and 1314. Historians consider that this continuation offers the most striking passages of the totality, both as literature and as history.

AL-GHĀZALI (ALGAZEL) See PHILOSOPHY, ISLAMIC

GIBRALTAR

Gibraltar, a strategically important peninsula on the Iberian coast in the Mediterranean Sea, was under Muslim rule from 711 until 1462, with a brief period

under Christian domination at the beginning of the fourteenth century. The name Gibraltar does not appear until 1310; in the ninth century it was known as Jabal Ṭāriq, "Mount of Ṭāriq"; in the twelfth century the name was officially changed to Jabal al-Fath, the "Mount of Victory." The official name of Gibraltar for the rock and the surrounding peninsula dates from the 1713 Treaty of Utrecht, which allocated Gibraltar to Great Britain. Gibraltar lacked an indigenous economy, but both the Christians and Muslims recognized Gibraltar's military importance.

There is, however, no documentary evidence of settlement until Fernando IV attempted to populate the peninsula after he captured Gibraltar in 1309; he also built a dockyard and a keep. The Marīnids, at the request of the king of Granada, recaptured Gibraltar in 1333. Alfonso XI, who had arrived too late to relieve the garrison, immediately planned the recapture of Gibraltar. This siege was not successful; it also permitted the possible recapture of Tarifa by the Muslims, which was prevented only by the battle of Salado. Alfonso was again besieging Gibraltar in 1349–1350 when the bubonic plague struck his army and included the king among its victims. After ten sieges Gibraltar surrendered in 1462 to the duke of Medina Sidonia, who later turned it over to the crown.

GIL DE ZAMORA, JUAN

Juan Gil de Zamora (d. after 1318), a Franciscan friar and historian, was appointed by Alfonso X of Castile as the tutor of his son and eventual successor, Sancho IV. Born perhaps about 1241, Juan entered the Franciscan order and was sent to study at the University of Paris (ca. 1272–1273) and later at Siena. Returning to Castile around 1278 with the title of master, he served as lector (teacher) in various Franciscan houses of study. After holding other administrative positions in the order, he was named provincial minister of the province of Santiago about 1300. In the meantime he served Alfonso X and his son, comparing his own relationship to Sancho with that of Aristotle and his disciple, Alexander the Great.

Juan's principal work, written about 1278 and dedicated to his distinguished pupil, was the *Liber de preconiiis Hispaniae*, a book extolling the glories of Spain. A confusing mélange of historical and geographical information, as well as ethical principles, it clearly reveals the author's pedagogical purpose.

Juan's broad acquaintance with the Bible, classical writers, Aristotle's philosophical treatises, John of Salisbury's *Policraticus*, and the principal peninsular historians is displayed on every page. His warning that royal avarice and unaccustomed exactions could result in the impoverishment of the kingdom seems to be a veiled criticism of Alfonso X.

Juan's *Liber de preconiis civitatis Numantine* (finished in 1282) was written in praise of his native Zamora, which he identified with ancient Numantia, famed for its resistance to Roman conquest. Also notable is his *Liber illustrium personarum*, a biographical dictionary with useful data concerning recent and contemporary figures such as Alfonso IX, Fernando III, and Alfonso X. He also contributed to the formation of Alfonso X's *Cantigas de Santa María* by collecting stories of the Virgin Mary's miraculous intervention in the lives of various saints. These were included in his *Liber Mariae*, a book hailing Mary's glories. As part of this work he also composed at the king's request (probably about 1278) Latin hymns for the Office of the Virgin Mary. Other unpublished philosophical and theological works include *Ars dictandi*, *Historia naturalis*, *Liber contra venena et animalia venenosa*, *Liber de arte musicae*, and *Proslogion seu de accentu et de dubilibus biblie*.

GIL DE ZAMORA, JUAN, ON MUSIC

After accompanying the royal court to Seville in 1260, Juan Gil (Aegidius Zamorensis) served no later than 1278 as *scriptor suus* (secretary) to Alfonso X's son and heir Sancho IV. In 1295 Gil became *vicario provincial*, and in 1300 *ministro provincial* for Santiago province of his Franciscan Order. The Franciscan minister general, Giovanni Buralli of Parma (r. 1247–1257) commissioned him to write “a succinct and easily understood introduction to music—omitting already familiar music examples.” During Giovanni of Parma's visit to Spain in 1248, he became lost one stormy evening in the mountains, thereafter asking that houses of the Franciscan order sing after compline the first nocturn of Our Lady's Office, which begins with the so-called *Benedicta* antiphon, then singing Psalm 66 and concluding with a prayer for the safety of prelates. Within Giovanni of Parma's musical context his asking the Spaniard Gil to write a music treatise becomes the more understandable.

In compliance with the minister-provincial's request for an elementary music treatise, Gil's seventeen

chapters contain constant citations from Scripture. His musical authorities—later constantly invoked Boethius and Isidore—include Rabanus Maurus, Walfredus Strabo, Petrus Comestor and John of Afflighem. Like the latter, Gil distinguished between *musicus* and *cantor*, the mere singer being of a much lower order than the scientific musician. He assigns each of the eight modes a distinctive emotional property, mode 1 being suited to all sentiments (including those in the Song of Songs). Mode 2 expresses sad or melancholy sentiments (the Lamentations of Jeremiah), mode 3 voices severity or harshness, mode 4 caresses, mode 5 comforts the despairing, mode 6 conduces piety and contrition mode 7 expresses adolescent joyousness, and mode 8 varies between the sweet and the morose.

Gil's Spanish upbringing shows itself in his chapter 8 dealing with mutations. His use of the word *regula* to mean line on a staff is also a distinctively Spanish usage. In chapter 17 on instruments he mentions the *canon*, guitar, and *rabé*, instruments known in Spain but not mentioned by Isidore from whom he copies most of his observations on musical instruments. Peculiar to Gil is the oft-quoted warning that only the organ befits divine service, the other instruments having become sullied by their use in secular environs.

Bartholomaeus Anglicus shared a portion of Gil's treatise (*De proprietatibus rerum*, book 19, chapters 132–146), the same portion transmitted in John of Trevisa's 1398 English translation (published in London in 1495).

GIRALDES, AFONSO

Afonso Giraldes is universally considered to be the author of the *Poema da batalha do Salado*, a laudatory poem about Afonso IV of Portugal, who participated, along with his son-in-law, Alfonso XI of Castile and León, in the Battle of Salado (1340). This work is written in octosyllabic quatrains rhyming *abab*, and reveals remarkable similarities with the *Poema de Alfonso XI*, written in 1348 by Rodrigo Yáñez, a poet probably of Leonese descent. The two texts share a similar purpose, employ the same metrical form, and contain identical lines, but still it cannot be affirmed that one author

copied from the other. The length of the *Poema da batalha do Salado* is uncertain—only fifty-six lines have survived.

Both poems have been referred to by some critics as “rhymed chronicles,” but such a classification seems inappropriate. It appears that both poets rely on their own memories of contemporary events, and that their common expressions belong to a stock of formulas from a powerful oral tradition. Perhaps it would be better to designate the poems as “new epics” that react against the excesses of the heroic epic, especially because both stem from a court tradition yet employ some devices of the traditional epic style.

GIRONA, CERVERÍ DE

A thirteenth-century Catalan troubadour whose professional name was taken from the town where he was born (Cervera, in the province of Lleida), he once used his original name, Guillem de Cervera, when addressing a verse book of proverbs, *Proverbis*, to his sons. His large production, written in the second half of the century (before 1285), makes him the last great troubadour and is closely related to his poetical service to the Aragonese kings and princes, especially Jaime I the Conqueror and his son Pedro III. However, despite acting as an official troubadour, and not as a *joglar*, he was inclined to raise his voice to criticize political events of his time. This relates, rather than to the role of moral adviser he played in many poems dealing with the decline of courtly virtue, to an asserting of proud awareness of his status in the court.

The same can be said as regards his personal remarks on the subtlety of his *trobar ric*, and certainly most of his witty lyrics show off both his metric and his wordplay virtuosity, which was highly appreciated by later courtly poets, such as Andreu Febrer and Jordi de Sant Jordi. Generally his 119 poems (five of them are narratives) cover the widest range of troubadour styles, genres, and topics, and even include unique examples of minor genres, often drawing on traditional lyrics, as in his parallelistic *Viadeyra*, which is virtually a *chanson de malmariée*.

The gaiety of these pieces and of some *pastorelas* contrasts with much of his love poetry, as does the sentimentalism of the latter with his misogynist poems (his *maldit bendit*, for instance, was meaningfully quoted in Eiximenis’s *Terç*). Cerverí’s verse *Sermó* points to some clerical Latin learning, reinforced by the above-mentioned *Proverbis* or, among other pieces, by his splendid religious *Alba*.

GOLD, AFRICAN

The search for precious metals was one of the prime movers of early European expansion, and it goes without saying that only Spain and Portugal were in a position to achieve a supply of it from overseas before the end of the fifteenth century—Portugal from its African discoveries as early as mid-century and Spain from the Antilles, especially Hispaniola, Cuba, and Puerto Rico, in its very closing years. In both cases the gold appears to have been largely alluvial. The Portuguese never extracted theirs from areas under their control, but always traded for it—in contrast, the Spaniards conducted or supervised the panning or sluicing operations on a fairly extensive scale. In neither case are there reliable figures available on the amounts gained.

The African gold trade was far older than the Portuguese participation in it, and in fact is mentioned by Herodotus. It was always accompanied by the slave trade, but it was entirely a trans-Saharan caravan trade, or at least until Fez or one of the North African ports had been reached, especially Tripoli or Ceuta. From there, caravans carrying trading goods or food moved south along any of a number of Saharan routes, usually calling at the mid-desert salt mines of Taghaza, where they exchanged the food for salt. Then they proceeded to Timbuktu, where they traded their salt or other goods for slaves or gold, the gold having been obtained by another set of traders from the Niger basin in exchange for the salt in the famous transactions known as the “silent trade.” Then the caravans returned by the same routes.

The Portuguese probably did not make significant inroads into this trade, but they did manage to syphon their gold supplies from much the same regions, though from the coastal regions—first from informal barter along the coasts, but soon after mid-century

from a *feitoria* (trading post) on Arguin Island, which remained active until around 1505, and after 1482 at São Jorge da Mina, or, as it came to be called after its loss to the Dutch in 1642, Elmina, on the Gold Coast (modern Ghana). In both cases beads, cloth, mirrors, and manufactured metal objects were traded for the gold, as well as for slaves—in both cases through intermediaries. Exactly how much was traded remains unknown, but to judge from the coining of Portuguese gold *dobras* after mid-century, the amounts obtained must have been considerable. There appears to be little ground, however, for assertions that the trade dealt a significant economic blow to the Muslim “enemy” across the Straits of Gibraltar.

GONÇALVES, NUNO

A Portuguese painter, Gonçalves (ca. 1425–ca. 1491) lived during the reigns of four kings—João I, Duarte, Afonso V, and João II. These were the most eventful years of Portuguese history, when the country moved from the old feudal order into a precapitalist mercantile society. It was a period of great contrasts, of royal deaths and public festivals, enlivened by the exciting news of the navigations and the discovery of new lands. Gonçalves expressed in his paintings the mood and the spirit of his age. His masterpiece is the polyptych of St. Vincent in the Lisbon cathedral. It consists of six wood panels representing St. Vincent, patron of Lisbon, being worshiped by the king, the court, and various communities. This vast work, comprehending sixty figures, was produced between about 1467 and 1481. Its portraits are remarkable for the accuracy of the physical detail that reveals the characters of the subjects: merchants, knights, princes, kings, bishops, the lower clergy, and ordinary people. The polyptych, as it survives, is incomplete. The entire work probably was presented to the cathedral by Afonso V to commemorate his victories in Morocco. St. Vincent holds a missal open to a passage of the Gospel according to John (14:30–14:31), where the reference to the prince of the world, Satan, has been interpreted as an allusion to Islam.

Gonçalves produced other paintings and probably drew the scenes of the Pastrana tapestry, which shows Afonso V at Arzila. The monumental representation of the human figure, in contrast to his inability to work out the perspective, makes him a foremost painter of

the fifteenth century. In recognition of his services, Afonso V knighted him around 1470. Gonçalves' portrait of Henrique “the Navigator” illustrates the entry on Henrique, Prince of Portugal in this encyclopedia.

GONZÁLEZ DE CLAVIJO, RUY

Fifteenth-century Castilian traveler born in Madrid (year uncertain). After Sotomayor and Palazuelos, who had been sent by Enrique III as ambassadors to the east, returned to Castile, the king called upon Clavijo to undertake an embassy to Tamburlain (Timur). Clavijo afterward wrote an account of the trip known under the title of *Embajada a Tamorlán*. It is the first known Castilian book of travels and includes both factual and fabulous information. Many of the places it names are difficult to determine with any precision. However, Clavijo departed from Seville in May 1403 in the company of two colleagues, one of whom was a theologian. They were loaded with gifts for Tamburlain. The ambassadors sailed the Mediterranean, reached Constantinople, traveled along the coast of the Black Sea, and landed at Trebizond, from whence they went to Tabriz, Teheran, and Meschud, arriving in Samarchand on 4 September 1404. There they were favorably received by Tamburlain, who, though mortally ill, nevertheless bestowed rich presents upon them. González de Clavijo was married to Mayor Arias, one of the few known women poets of the fifteenth century, who during her husband's absence wrote a lyrical address to the sea pleading for his safe passage and return. Upon returning to the Iberian Peninsula in 1406, Clavijo and his party proceeded directly to Alcalá de Henares, where the king conferred the title of chamberlain upon him in recognition of his exploits. After Enrique III's death Clavijo retired to Madrid, where he died in April 1412.

The account of González de Clavijo's travels, along with a brief biographical sketch, was first published at Seville in 1582 by Argote de Molina. Recent research into the *Embajada a Tamorlán* by López Estrada, however, has placed into question González de Clavijo's sole authorship, proposing that the bulk of the work was composed by Alfonso Páez de Santa María, the theologian who accompanied Clavijo on his embassy, and may even include material from Muhammad Alcací, one of Tamburlain's envoys to Castile.

GONZÁLEZ DE MENDOZA, PEDRO

Lawyer, priest, statesman, patron of the arts, and operative head of Spain's most powerful clan, Pedro González de Mendoza (1420/1428–1495) was the fifth son of Catalina Suárez de Figueroa and Íñigo López de Mendoza, Marquis of Santillana. He studied civil and canon law at the University of Salamanca; responded to his father's request to translate into Castilian Virgil's *Aeneid*, celebrating the origins of the Roman empire; then became an architect of the Spanish Empire being referred to as "the Third King" during the reign of Fernando and Isabel.

González de Mendoza showed himself an able proponent of a strong monarchy and Spanish unity under Castilian hegemony while a member of Enrique IV's council, and in coming to support the succession of Isabel and Fernando against the young, single, and seemingly weaker claimant Juana, who may or may not have been Enrique's daughter. In 1476 Isabel legitimated his sons, Rodrigo, Diego, and Juan. Named archbishop of Seville and cardinal of Sancta Maria in Domini in 1473, González de Mendoza became archbishop of Toledo in 1485. Known as the Cardinal of Spain, advising Isabel in particular, he presided over the royal council for twenty years.

González de Mendoza's armies and money, and his role in requisitioning ecclesiastical wealth, were crucial in defeating the Portuguese, and in 1476 he emerged as hero of the decisive Battle of Toro, which assured Castile to Isabel. He prepared the way for reasserting royal authority in Seville, officiated at the baptism of Prince Juan, negotiated the neutrality of Louis XI of France, advised on peace terms with Portugal, enhanced royal revenues by revoking *juros* (bonds) issued during civil war in the reign of Enrique IV, then performed a range of services crucial to winning the war against Muslim Granada. González de Mendoza was nearly always at Isabel's side, and it was his great silver cross, placed atop the Alhambra, that signaled victory in 1492. He commissioned Rodrigo Alemán to carve the fifty-odd scenes of Muslim towns surrendering on the choir stalls in Toledo's cathedral. And he advised Isabel to sponsor the initial voyage of Christopher Columbus, arguing there was little to lose in providing three ships and perhaps much to gain.

González de Mendoza was the principal Spanish mediator with the papacy in the process of instituting the Spanish Inquisition. Earlier he had issued a pastoral letter (now lost) instructing clergy to catechize backsliding converts from Judaism. Hernando del Pulgar characterized him as a moderate opposed to inquisitorial methods. Yet although nondoctrinaire, worldly, and pragmatic, clearly he worked toward an exclusively Christian Spain, sanctioning force when persuasion failed. Powerful in patronage, he suggested that Isabel choose first Hernando de Talavera, and then Francisco Jiménez de Cisneros, as her confessor and adviser, and then that she select Jiménez as his successor both as archbishop of Toledo and as first minister. Ill with kidney disease for a year, he died in January 1495.

González de Mendoza amassed positions for his relatives and titles and fortunes for his sons, and supported religious and charitable foundations—the Church of the Holy Sepulcher in Jerusalem and the Church of the Holy Cross in Rome. He founded and endowed the Hospital de Santa Cruz in Toledo and the Colegio de Santa Cruz in Valladolid, where on the facade he had himself portrayed as donor, with balding head and sensible workaday face. Yet chronicles, other texts, art, and architecture belie that portrait's simplicity.

GONZÁLEZ, DOMINGO (DOMINICUS GUNDISALVUS)

Domingo González, or Dominicus Gundisalvus (or Gundisalinus, among other variants), Archdeacon of Segovia, was chief assistant to Raimundo I, Archbishop of Toledo, founder and driving force of the twelfth-century Toledo School of Translators. Gundisalvus's contemporaries associated with the school include John of Spain, a converted Jew and Gundisalvus's partner in translation, Hermann of Carinthia, Robert of Chester, Adelard of Bath, Walter of Malvern, Michael Scot, Hugo of Santalla, and other intellectual elites of western Europe. Gundisalvus was active in the second quarter of the twelfth century and is known both for translations and for original works extant in codices housed in the National Library in Paris.

Twelve known translations from Arabic into Latin that are due at least in part to his involvement include

Avicenna's (Ibn Sīnā) *Metaphysica Avicennae* . . . sive de prima philosophia, *Physicorum Avicennae liber primus*, *Liber de anima Avicennae*, *Liber Avicennae de coelo et mundo*, *Logica Avicennae*, and *Liber Avicennae de ortu scientiarum*; (Al-Ghazālī's) *Physica*, *Logica*, *Metaphysica*, and *Philosophia*; Avicbron's *Fons vitae*; and al-Fārābī's *De scientiis*, the translation of which is also attributed to Gerard of Cremona. The prologue to his translation of Avicenna's *De anima* reveals the collaborative method of translation probably used in the School of Translators.

Given the essentially Aristotelian and (Neo-) Platonic thrust of his sources—Al-Fārābī, Avicenna, Avicbron, and Algazel—it cannot be too surprising that Gundisalvus should manifest the same thrust in his original philosophical writings, of which five are known: *De processione mundi*, *De anima*, *De unitate*, *De divisione philosophiae*, and *De immortalitate animae*. The influence of his sources is so great that some maintain that these originals are little more than translations with elaborations. Although Gundisalvus distinguishes theology (*scientia divina*) from philosophy (*scientia humana*), Sarton provides the following maxim that makes Gundisalvus's view of philosophy patent: "nulla est scientia quae philosophiae not [*sic*] sit aliqua pars." Furthermore, Sarton presents, Gundisalvus's classification of knowledge as follows: propaedeutics (comprising grammar, poetics, and rhetoric), logic, and the sciences of wisdom (*scientiae sapientiae*). The *scientiae sapientiae* are divided into the theoretical and the practical: "The theoretical branches are (a) Physics (*scientia naturalis*), divided into *medicina*, *indicia*, *nigromantia*, *ymagines*, *agricultura*, *navigatio*, *specula*, *alquimia*; (b) Mathematics, divided into *arithmetica*, *geometria* (and optics), *musica*, *astrologia*, *scientia de aspectibus*, *de ponderibus*, *de ingeniis*; (c) Metaphysics. The practical branches are politics, economics and ethics." Sarton observes that the writings of subsequent philosophers—Michael Scot, Albert the Great, and Robert Kilwardby—reflect Gundisalvus's classification in their own writings.

Gundisalvus's primary contribution can be summarized, then, as his having transmitted, from Arabic culture to Western Christendom, Arabic Aristotelianism combined with (Neo)Platonism, filtered to some extent through Christian theology.

GONZÁLEZ, FERNÁN

Fernán González (ca. 910–970), "first count of Castile," gained Castile's independence from the kingdom of León through military skill, luck, and shrewd political maneuvering. His popularity can be seen in the large number of ballad, poetic, and chronicle sources that describe his exploits and make him the most famous Castilian hero next to El Cid.

During the dynastic dispute that followed the death of Ordoño II of León (924), Fernán González supported Ramiro II over his older brother, Alfonso IV (the Monk) as king of León. The strength of the alliance was recognized by Queen Toda of Navarre when she arranged the marriage of her daughter Sancho to Fernán in 932 and her daughter Urraca to Ramiro II.

While supporting Ramiro II, Fernán distinguished himself in battle against the Moors at Toledo (933), Osma (934), and Simancas (939). As Fernán founded and protected monasteries, and expanded his territory, he began using the title *gratia Dios comes* (count by the grace of God), suggesting a hereditary title and not a temporary grant by the king of León. Ramiro, fearing that Fernán was not acknowledging his feudal bonds, intervened by sending his son, Prince Sancho the Fat, to harass Castile and capture Fernán González. In 944, the count was imprisoned until his wife and vassals finally gained his release. After his release Fernán demonstrated his loyalty to Ramiro by marrying his daughter Urraca to Ramiro's son Ordoño III.

Fernán González was at the peak of his power in the mid-tenth century. By 947 he was again using the title "count by the grace of God," and upon Ramiro II's death in 951, Fernán's daughter became queen of León. However, Ordoño III died without heir in 956, and the count's enemy, Sancho the Fat, claimed the throne. Unwilling to allow the ravager of Castile to sit on the throne, Fernán González married his widowed daughter to the son of Alfonso IV and installed him as Ordoño IV while Sancho was on a weight reduction visit in Pamplona. Ordoño IV ruled for two years until a slimmer Sancho I returned and forced Ordoño to flee in 960. Fernán González was thrown in prison a second time (960–962) and released only through the intervention of his mother-in-law, Queen Toda, who wanted to put down a revolt by Fernán's loyal vassals and, perhaps, to ensure that her grandson would inherit the title Count of Castile. Upon his release the count arranged his daughter's divorce from Ordoño IV and

married her to the heir of the Navarrese throne. The now widowed Fernán wed the daughter of King García II Sánchez of Navarre and spent the rest of his life in relative peace.

Though only a handful of documents mention the historical Fernán González, the legendary figure appears in numerous ballad, poetic and narrative sources. The best known of these is the *Poema de Fernán González*, written about 1250 by a monk from the Benedictine monastery of San Pedro de Arlanza. Prosified versions of the *Poema* also appear in the *Primera crónica general* and the *Crónica General de 1344*. Unlike the historical figure, the poetic Count Fernán is a crusader who wins much land from the Moors and gains Castile's independence from the kingdom of León through a shrewd economic deal. He is married only once, to Doña Sancha, who helps him escape from prison twice. Regardless of the activities of the historical count, the presence of the fictional count in poems, ballads, and chronicles suggests a strong and lasting fascination with Fernán González, first count of Castile.

GRAN CONQUISTA DE ULTRAMAR, LA

The only Castilian chronicle about the Crusades, *La gran conquista de Ultramar* is a long work that survives in four manuscripts (1187, 1920, and 2454, Biblioteca Nacional de Madrid; 1698, Biblioteca Universi-

taria de Salamanca) and a print version (Salamanca, 1503), yet none of the manuscripts is complete. In fact, together they cover only about 73.5 percent of the text; 26.5 percent of the text is covered exclusively by the Salamanca print, the sole complete version of the work. In addition to a number of partial editions of the work, which transcribe most of the manuscripts, there are two complete editions. The first, by Pascual de Gayangos (Madrid, 1858), follows the Salamanca print and manuscript 1187. The second, by Louis Cooper (Bogotá, 1979), follows the Salamanca print alone. The *Conquista* was included, in a condensed form, in the fifteenth-century Galician *Crónica general de 1404*, an interesting chronicle, yet to be edited, that also includes several Arthurian legends (Hispanic Society of America, B2278).

The most studied issue regarding the *Conquista* is the matter of its author. The Salamanca print attributes the work to Alfonso X, an attribution never questioned until Gayangos, in the prologue to his edition, argued against it and in favor of a much later date of composition, which he placed in the fourteenth century. Although many of his arguments were not accepted by the critics, who settled the question by attributing the work to Sancho IV, its basic line of reasoning prevailed. Gayangos discovered that except for the attribution clause, the text of the prologue was the same as that of the *Bocados de oro*. This caused him to conclude that the editor of the *Conquista* had copied the prologue from that work. However, although the *Bocados de oro* dates from before the *Conquista*, its prologue appears to be a fifteenth-century addition, so it is difficult to know which work borrowed it from the other, or if they both borrowed it from a third source. In any event, even if the prologue had been borrowed at some point, that would not necessarily mean the accompanying attribution clause, present in the *Conquista* but not in the *Bocados de oro*, was false. Gayangos thinks it is, because the oldest manuscript, 1187, attributes the work to Sancho IV. However, this manuscript covers only the end of the work. Therefore, its attribution does not guarantee that Sancho was also the author of the beginning of the work. Indeed, manuscript 1920, which also attributes the work to Sancho IV, says he ordered the scribe to translate this work "from the conquest of Antioch on." This could mean that was the portion of the work done by the scribe, but also mean that it was the portion of the work undertaken by Sancho. Since manuscript 1698 attributes the work to Alfonso X, this attribution cannot be a forgery by the editor of the Salamanca print.

Operating with positivistic presuppositions, Gayangos did not take into account the way medieval chronicles were composed: by different kings and

scribes over a long period of time. The attributions to Alfonso X and Sancho IV are not really contradictory, for it is perfectly possible, and in fact most likely, that the project was conceived and started by the father, continued by the son, and finished at a later date. This would make sense, since Alfonso, in addition to having a known passion for writing chronicles, was clearly obsessed with the Holy Land and dreamed about leading a European crusade, following in Louis IX's steps, as he showed in his letters and wills, as well as in the *Cantigas*. His capture, in the first years of his reign, of the North African city of Salé, shows his early interest in the project. This interest seems to have increased in the last years of his life, when, in all probability, he ordered the composition of the *Conquista* out of frustration, nostalgia, and hope.

This chronicle, which is a translation not only of the *Eracles*, but also of several French epics about the Crusades, all combined in Alfonso X's customary style, begins with the uprising of Muḥammad and ends with Louis IX's expeditions to North Africa, the enterprise Alfonso so much wanted to continue. The most famous part of the work is the Swan Knight episode, which has traditionally been considered a chivalric romance (fiction) included in a chronicle (history). However, according both to recent theories of historiography and to medieval views on the matter, chronicles must be read as a whole and cannot be divided into "historical" and "fictional" parts. When approached in this manner, the links between this episode and the rest of the chronicle become obvious. The Swan Knight is a chivalric archetype, and Godfrey of Bouillon's life follows it faithfully. In the *Conquista* the successes and failures of the Christians in the Holy Land are presented as depending on their following or deviating from the chivalric model offered by the Swan Knight and his grandson, Godfrey of Bouillon. This provides an explanation for their rather depressing defeats and a recipe for much-desired victories at the same time. This work is, therefore, a chivalric chronicle. Its structure was reproduced in *Amadís de Gaula* and the chivalric romances of the Golden Age, which are basically long accounts of the ups and downs of knights involved in crusade-like adventures in distant lands. Alfonso X's great love for chivalry is well documented. In his other chronicles he included chivalric episodes, such as the tale of Pirus in the *Estoria de España* and the tale of Bruto in the *General estoria*. In *La gran conquista de Ultramar*, he did the same thing, only on a larger scale, as was called for by the more chivalric framework of this chronicle, the subject of which was the closest to his heart.

GRANADA, CITY OF

Granada was founded as a walled city in the turbulent period following the collapse of the Islamic caliphate in the eleventh century. ʿAbd Allah ibn Buluggūn, last of the Zīrid line there, tells in his memoirs how his forebear Zāwī ibn Zīri had proposed to the inhabitants of Elvira, capital of that region (*kūra*) in caliphal times, the selection of a suitable nearby hilltop defensive position (*maqil*) to which they, together with him and his Sanhāja Berbers, should move. To these original Andalusī and Berber elements was added a considerable Jewish presence, and Bargebuhr has argued that the oldest parts of the Alhambra incorporate the palace of the Jewish minister Joseph ibn Naghrilla. Under the Zīrids, Granada flourished as capital of their *tāʾifa* state, and this prosperity continued under the Almoravids and Almohads. After the Almohad rule collapsed, and with Christian forces perilously close, dignitaries from the city invited the caudillo of Arjona, Muḥammad ibn Naṣr, to enter, which he did in 1238. The city began to expand as Muslim refugees flocked in from areas falling to the Christians.

Making use of old Zīrid fortifications, Muḥammad soon converted the Alhambra hill into a palace-citadel of great defensive strength (and incomparable beauty) that would serve the Naṣrid dynasty he founded until the end, in 1492. The city proper (*madīna*) lay below, with the principal public buildings: the mosque (the cathedral now occupies the site); the caravanserai (*funduq*) for merchants, in the building now known as the Corral del Carbón; the covered market or *alcaicería* (Arabic, *al-qaysariyya*, the word for officially administered markets in a number of cities, not just in Granada); the hospital (*maristan*); the college (*madrāsa*) founded in 1349. The city's economic prosperity rested in part on the trade in locally produced silk, and on its processing and weaving; the industry was carefully regulated by a powerful trade guild.

Walled suburbs (Arabic, *rabād*; plural, *arbād*) spread over the hills of Granada's magnificent site; one in the south was called Najd (Uplands, perhaps to recall a place-name in the Arabian Peninsula). Some quarters had names indicating the principal occupation of the inhabitants (e.g., *Al-Fakhkharīn*, "of the potters"); others, the place of origin of the original inhabitants (e.g., Antequeruela, settled by refugees from

Antequera after 1410). The existence of strong walls, not only around the whole city but also between one *rabād* and another, was of particular importance in the final period, when factional discord brought interne-cine strife.

Watered by aqueducts and other channels, broad green zones planted with trees, and interspersed with pleasure palaces and summer residences (of which the Generalife is an outstanding surviving example), surrounded the city. Irrigation reached up to levels abandoned to *secano* (dry lands) in modern times.

Population in Zirid times has been estimated at 26,000. Under the Naṣrids immigration took the figure much higher. The estimate for 1492 of 40,000, given by Andrés Bernáldez, the curate of Los Palacios, is very low, and presumably refers only to remaining permanent residents. L. Marineus Siculus speaks of 150,000, a high figure presumably reflecting the influx of troops and of refugees. For the German traveler Munzer, in Granada shortly after the surrender, there was no greater city in Europe or in Africa. There is an unresolved controversy both with regard to the exact spatial relationship of Granada to earlier cities thereabouts (Ilibira, Qastiliya, Illiberis) and to the antiquity and etymology of the name Granada. That a place-name Garnata existed before the Zīrid foundation is clear. Pocklington reviews the bibliography on the etymology very fully and argues that Garnata is of Romance origin, from *granata*, not in the primary sense of "pomegranate," but rather in the derived sense of "red" (because of the local soil). It seems unlikely that this debate is closed.

GRANADA, KINGDOM OF

The Berber *tāʾifa* kingdom of Granada was created by Zāwī ibn Zīrī, and, after his return to North Africa in 1020, it continued to be ruled by his family until the Almoravids deposed ʿAbd Allāh (b. Buluggīn) in 1090.

The kingdom of Granada again achieved autonomy in the mid-thirteenth century, but now it was the sole surviving Islamic state (it covered, beside the modern province of Granada, that of Málaga and Ronda, as well as parts of Jaén and other areas). The dynasty that ruled it up to 1492, the Banūʾl-Aḥmar or Banū Naṣr, came from Arjona, where, in 1232, they had made a reputation for themselves rallying their fellow Muslims to the *jihād*. In the years immediately following, their campaigns were scattered (in Jaén, Córdoba, Seville, Jerez), and had no lasting effect, but in Granada the activities of Muḥammad Ibn al-Aḥmar found the necessary focus. Orthodox Muslim opinion disapproved of Muslims remaining as subjects of Christian rulers, so large numbers of the pious, especially the well-to-do and the well-educated, emigrated to the kingdom of Granada. The resettlement of so many refugees posed many problems, but the prosperity which this mountain kingdom was to achieve rested on the basis of the presence there of a large skilled population committed to wresting a living from difficult terrain by intensive methods of agriculture.

While elsewhere Romance speech and Arabic co-existed; in Granada, however only Arabic was spoken. And since the inhabitants were those who had opted to live in an Islamic state, this was a pious society where men of religion, the ʿulamāʾ and *fuqahāʾ*, enjoyed prestige and power. It was a culturally cohesive and monoglot nation state. In some places—Granada itself, Málaga, and, above all, Lucena—there were large Jewish communities, but of the other *dhimmi*s, the Christians, we hear little, and indeed nothing is known of surviving Mozarabic Christians; such Christians as there were came from outside: slaves, resident foreigners, fugitives from justice.

The key to the survival of the kingdom of Granada through the difficult early days lay in the deal struck between Muḥammad I and Fernando III of Castile at Jaén in 1246. All Christian sources agree that Muḥammad became the vassal of the Castilian monarch, and thereafter provided sustained military help to him in his enterprises—at the conquest of Seville, for example. At Fernando's death in 1252, Muḥammad and all his people mourned. In the Castilian view, a permanent bond was established, and the kingdom of Granada acquired an indelible vassal status. For Granada to pursue an independent policy thereafter was treasonable. There is no indication that the Granadans shared this view at all. In Islamic law, a ruler is not able to place himself, still less his Muslim subjects, in permanent subordination to a Christian monarch. To protect its independence Granada needed to find a North African counterbalance to the power of the Christians. The danger was that, as in 1090, protectors would become

dominant masters. The principal skill required of the rulers of the Granadan state was the ability to juggle alliances, and at times the rapid switches of alignment which proved necessary are disconcerting.

During the late thirteenth and early fourteenth centuries it was the Marīnids who provided most of the military assistance. Their first large-scale intervention came in 1275, when 5,000 cavalry crossed from Tangier, and from then onward there were North Africans fighting in almost all the campaigns, sometimes in their own formations, occupying territory as their own, sometimes in units incorporated into the Granadan forces, sometimes as individual volunteers motivated by the duty to sustain the *jihād*. Without North African assistance, it is difficult to imagine that Granada would have survived as long as it did.

Muḥammad I died in a riding accident and was succeeded by his son Muḥammad II (1273–1302). Such stability is difficult to match in later reigns. Muḥammad II possessed a strong but warped personality: there is a strong suspicion that he murdered his own father. His short reign was brought to an end by public indignation at insane policies that led Granada into conflict not only with Aragón and Castile, but with the Marīnids as well. The reign of Naṣr (1309–1314) was not without its successes: a determined Aragonese onslaught on Almería was beaten off, but the loss of Gibraltar to the Castilians was much lamented. In 1314, power passed for the first time away from the line of Muḥammad I to a collateral branch. Ismāʿīl (1314–1325) had presented to him a great opportunity when the foolhardy Castilian regents, Pedro and Juan, exposed their forces rashly near to Granada itself and suffered an ignominious defeat. Ismāʿīl's aggressive policies seemed vindicated, but he was to die in an affray inside the Alhambra. It was his youngest son, Muḥammad IV (1325–1333) who was proclaimed ruler by the minister Ibn al-Maḥrūq. Far from bearing this minister gratitude, Muḥammad had him assassinated before three years' time, allegedly because he was in negotiation with the Castilians. Thus did the history of the kingdom of Granada settle into a bloody pattern according to which changes of government were brought about by assassination. That the state was to survive in spite of this for another century and a half is due, in large measure, to the political genius of Yūsuf I (1333–1354). His was a golden age of Granadan culture, and some of the finest of the buildings of the Alhambra stand as his monument. Although Granada experienced some reverses, notably at Salado in 1340, Yūsuf seems not to have been held responsible. His reign ended when a madman stabbed him to death in the mosque.

Muḥammad V came to the throne in 1354 and his reign closed with his death in 1391, but this span of

thirty-seven years was interrupted by the reigns of Ismāʿīl II and Muḥammad VI. Such interrupted reigns are a peculiar feature of Granadan political life. A political faction could launch a coup with success, but their creature could not consolidate his grasp on power. Another feature of this coup that was to be repeated was the role played by one of the powerful ladies of the royal family, Maryam, one of the wives of Yūsuf I. Ismāʿīl II (1359) is described as soft and effeminate. Muḥammad VI, who replaced him, is portrayed with equal hostility, as coarse and lacking in refinement, ready to roll up his sleeves and to go about bareheaded. His misfortune was that an even tougher prince, Pedro the Cruel of Castile, held a grudge against him. Most unwisely Muḥammad VI cast himself on Pedro's mercy in Seville: Pedro had none, and chopped off his head. In 1362 Muḥammad V could thus take over the kingdom once more: he was to remain in power for nearly thirty years.

Yūsuf II succeeded his father without violence in 1391, but his short reign proved a bloodbath. He had a faithful minister, Khālīd, hacked to pieces before his own eyes, and three of his brothers met their death. His own death is alleged to have come when he put on a poisoned tunic, a gift from the King of Fez.

A policy of negotiating truces with the Castilians in return for tribute had given the Granadans in the late fourteenth century the peace that enabled them to build up their economic strength. Yūsuf II's younger son and successor, Muḥammad VII (1392–1408) refused to pay for truces. Blood now flowed on the frontiers. When he died, in 1408, his elder brother, brought out of prison in Salobreña to reign, tried to negotiate for peace once more, but facing him was Fernando, to be known as *el de Antequera*. Yūsuf pointed to the harm both sides suffered from "pointless loss of life and property inflicted on great knights and good men." If Yūsuf wanted peace, Fernando countered, let him acknowledge himself a vassal of Castile "and pay the tribute which they used to give to Alfonso the son of Fernando who conquered Seville." This in essence was the Castilian position from this point on: vassalage or nothing.

The period following the death of Yūsuf II provides an extreme example of multiple interlocking reigns. Muḥammad IX came to the throne in 1417, but in following years power was to pass between Muḥammad X and XI and Yūsuf IV and V. The initial impression is of extreme political instability, but if we note that over a period of thirty-five years one ruler (Muḥammad IX) ruled for twenty-seven years; another (Muḥammad VIII) for four; and the other three for less than a year apiece, Granada may appear less volatile than many other states. Muḥammad IX stood out against

the Castilian demands that their suzerainty be recognized, and so the Castilians sought to replace him by puppets who did not prove acceptable to the Granadan people. It was Muḥammad IX's desire to arrange for the transfer of power after his death to his own nominee, but a rival claimant emerged: Sa'd (Cirizá in Castilian sources). From 1455 Sa'd was to rule without a rival until in 1464 his own son, Abū'l-Ḥasan 'Alī rose against him. Abū'l-Ḥasan and then his brother al-Zagal were to provide aggressive leadership until very near the end for the people of this beleaguered kingdom. Romantic history seeks to connect the fall of Granada with Abū'l-Ḥasan's turbulent private life: his alleged preference for the beautiful Isabel de Solís over his noble Arab first wife. No doubt harem politics had some impact on the conduct of public affairs, but the kingdom of Granada fell because, on the one hand, the sustained policy of the Castilians of wrecking Granadan agriculture by destructive raids (*talas*) was finally having the desired effect, and, on the other, the Castilian crown had at last found the determination and the means to keep sufficient troops, and sufficient artillery, in the field for long enough to batter down the defenses of the principal Granadan strongholds. At a time when the new artillery was swinging the balance in favor of those who attacked, the defenders of Granada's castles found it difficult to hold out.

The one monarch so far unmentioned is Muḥammad Abū 'Abd Allāh (Boabdil). It is highly likely that the Castilians intended to use this prince as a malleable puppet in order to outmaneuver the "old king" Abū'l-Ḥasan, and indeed in 1492 it was Boabdil who finally handed over the keys to the Alhambra. But Boabdil's motives were enigmatic, and his actions at times under siege were heroic. The capitulations he negotiated would have provided protection for his people if the Castilians had kept their part of the bargain. The problems that arose came after the kingdom of Granada had ceased to exist, when there were no sanctions that could be invoked against those who broke their word. The existence of a Muslim kingdom of Granada had been the ultimate guarantee of the rights of Muslims throughout the Iberian Peninsula for a quarter of a millennium. The rapidity with which forcible conversion to Christianity followed after 1492 was a clear demonstration of how necessary to the Muslim cause the existence of this kingdom had been.

GRANDE See NOBLES AND NOBILITY

GUADALETE, BATTLE OF

Guadalete is the name most commonly given to the battle between the Visigothic king Roderic and the invading army of Arabs and Berbers led by Tāriq ibn Ziyād. In this encounter, fought almost certainly in 711, the Arabs were victorious, thus opening the way to their rapid conquest of Spain. Arab sources are almost unanimous in locating the battle at a site called Wadilaqqa, but the identification of this with the valley of the Guadalete River, between Medina Sidonia and Jerez de la Frontera, was first made in the *De rebus Hispaniae* of Archbishop Rodrigo Jiménez de Rada and has not always been accepted by modern historians. Some have preferred to locate the battle in the vicinity of the Laguna de Janda, south of Medina Sidonia. However, it is not clear how much weight should be given to any Arab accounts of the battle, which are heavily laden with legendary accretions and none of which dates in present form to before the eleventh century. The near contemporary Christian Latin Chronicle of 754 merely locates the battle in "the Transductine Promontories." This source also makes the battle part of a longer and more complex Arab and Berber campaign in Spain in 711–712 than the simple invasion and decisive victory that the Arab histories imply. In the legendary historical traditions of the Asturian kingdom, contained principally in the two versions of the *Chronicle of Alfonso III*, Roderic's defeat is attributed to the treasonable actions of the two sons of his predecessor, Wittiza. This needs to be regarded with considerable skepticism.

GUDIEL, GONZALO PÉREZ

One of thirteenth-century Castile's outstanding churchmen, successively the bishop of Cuenca (1272) and Burgos (1275), the archbishop of Toledo (1280) and the cardinal-bishop of Albano (1298). He was a confidant and counselor to both Alfonso X and Sancho IV, a rare achievement that testifies to the diplomatic skills he had acquired in his years abroad (during which he was active at the papal curia and figured as rector of the University of Padua). He came from a Mozarab family and was the first of that descent since 1085 to achieve the highest office in the Castilian church. As notary for Castile and chancellor during the critical years of Alfonso X's reign, he was well placed, and (if the contents of his remarkable library provide any guide) no less qualified to assist in all departments of that king's intellectual endeavors—legal, historical, and scientific. His domination during Sancho's reign seems to have been even more complete. However, the reaction after the latter's death involved Gudiel's political marginalization: the *corte* (parliament) of Valladolid (1295) marked the low point of his fortunes. But from this he made a triumphant recovery. Summoned to Rome in disgrace, on arriving there he received the red hat. The Maecenas of his generation, he counted among his intellectual intimates both Jofre de Loaisa and Ferrán Martínez, author of the *Libro de caballero Zifar*, the prologue to which records the return of the cardinal's corpse to his native city.

GUESCLIN, BERTRAND DU

Known in fourteenth-century Castilian sources as Bertrán Claquín (because of mythical Muslim ancestry), Guesclin occupies an important place in French history and lore not unlike Castile's Cid Campeador. His exploits on the battlefield in defense of king and honor are celebrated in chronicle and verse; he is portrayed as patriotic and loyal, fierce and courageous, just, eloquent, and wise. This reputation notwithstanding, Guesclin, like Díaz de Vivar, was primarily a highly successful mercenary.

Born around 1314 in Motte-Broon to a family of the lesser nobility of Brittany, he distinguished himself for his courage and military prowess during a period of European history—the Hundred Years' War—that afforded him ample professional opportunities. He ex-

celled as commander of mercenary troops. Left idle by a truce between the English and the French, the main antagonists of the war, Guesclin twice signed on to lead armies into Castile to help Enrique de Trastámara usurp the throne from his half brother, King Pedro I. Financing for these ventures came mostly from the papacy in Avignon and King Charles V; they were eager to rid France of the disruptive and violent presence of large bands of unemployed soldiers and to install a pro-France ruler in Castile.

Guesclin first entered Castile in early 1366 at the head an international force of some ten thousand mercenaries, and by March, Enrique was crowned king of Castile. Guesclin returned to France, only to be recalled by Enrique the following year when Pedro I reentered Castile from forced exile, followed by ten thousand English soldiers.

On 3 April 1367, at the battle of Nájera, Pedro carried the day. Enrique escaped to France; Guesclin was taken prisoner but was soon freed. Pedro's victory proved ephemeral. His English allies left the peninsula, and he was outnumbered when Enrique reappeared in the fall of 1367 and was later joined by Guesclin. A few miles south of Toledo, the two armies met again. Pedro, routed, sought refuge at the fortress of Montiel, from which he negotiated his escape with Guesclin. Instead, the French commander delivered Pedro to Enrique, who stabbed Pedro to death on 23 March 1369.

Guesclin, rich with Castilian titles and lands, returned to his native land and was appointed constable of France in 1370. He sold his Castilian holdings back to Enrique II and spent the rest of his life in the service of the French until his death from illness, at age sixty-six, during a siege in Languedoc on 13 July 1380. He was buried at St. Denis with great honors.

GUILDS See COFRADÍA**GUZMÁN, DOMINGO DE**

Domingo's birth at Calaruega, Castile, about 1170 and his infancy were said to have been attended by marvels forecasting his sanctity and great achievements. From the ages of seven to fourteen he studied under the tutelage of his uncle, the archpriest Gumiel de Izán. In 1184 Domingo entered the University of Palencia, where he remained as a student for ten years. On one occasion he sold his books to help the poor and homeless of Palencia. His biographer, Bartholomew of

Trent, says that he twice tried to sell himself into slavery to raise money to free captives held by the Moors.

The date of Domingo's ordination to the priesthood is unknown. He was a student at Palencia when Martín de Bazán, bishop of Osma, called him to be a member of the cathedral chapter and to assist in its reform. In recognition of his success, Domingo was appointed subprior of the reformed chapter. On the accession of Diego de Azevedo to the bishopric of Osma in 1201, Domingo became prior of the chapter. As a canon of Osma, he spent nine years in contemplation, scarcely ever leaving the chapter house. In 1203 King Alfonso IX of Castile deputed the bishop of Osma to ask for the hand of a Danish princess on behalf of his son, Prince Fernando. The bishop chose Domingo to accompany him. Passing through Toulouse, they witnessed with consternation the effects of the Albigensian heresy. As a result Domingo conceived the idea of founding an order for combating heresy and spreading the Gospel by preaching throughout the world. After completing their mission in 1204, Diego and Domingo went to Rome, and from there they were sent by Pope Innocent III to join forces with the Cistercians, who had been entrusted with the crusade against the Albigensians. The pair quickly saw that the failure of the Cistercians was due to the monks' indulgent habits, and prevailed upon them to adopt a more austere life. The result was a greatly increased number of converts. Theological disputations played a prominent part in the preaching to the heretics, and Domingo and his companion lost no time in engaging in them. Unable to refute his arguments or counteract the influence of his preaching, the heretics often made Domingo the target of insults and threats.

Domingo realized the need for an institution that would protect women from the influence of the heretics. Many of them had already embraced Albigensianism and were among its most active advocates. With the permission of Foulque, bishop of Toulouse, he established a convent for women at Prouille in 1206. To this community he gave the rule and constitution that to the present day guide the nuns of the Second Order of Saint Dominic. On 15 January 1208 Pierre de Castelnau, a Cistercian legate, was assassinated, an event that precipitated the Albigensian Crusade under Simon de Montfort and led to the temporary subjugation of the heretics. During the crusade Domingo followed the Catholic army, seeking to revive religion and reconcile heretics in the cities that capitulated to Montfort. In September 1209 he came into direct contact with Montfort and formed a close friendship that would last until Montfort's death at Toulouse in 1218. Montfort regarded his victory at Muret as a miracle attributable to Domingo's prayers. Domingo's reputation for sanctity, apostolic zeal, and learning made him

a much sought-after candidate for various bishoprics, all of which he refused, preferring to preach. The foundation of the Inquisition, and his appointment as the first inquisitor, is ascribed to Domingo during this period, although there is evidence to indicate that the Inquisition was functioning as early as 1198.

By 1214 the influence of Domingo's preaching and his reputation for holiness had drawn a group of disciples around him. The time was right for the realization of his desire to found a religious order to propagate the faith and combat heresy. With the approval of Bishop Foulque of Toulouse, who made him chaplain of Fanjeaux in July 1215, he organized and canonically established a community of followers as a religious congregation whose mission was the propagation of true doctrine and good morals, and the eradication of heresy. Pierre Seilan, a wealthy citizen of Toulouse, placed himself under Domingo's direction and put his large house at Domingo's disposal. There the first convent of the future Order of Preachers (now known as the Dominicans) was established on 25 April 1215.

In November 1215 an ecumenical council convened in Rome to deliberate on the improvement of morals, the extinction of heresy, and the strengthening of the faith, an agenda identical to the mission of Domingo's new order. Along with the bishop of Toulouse, Domingo went to Rome to petition that his new order carry out the mandates of the council. His request, however, was not granted. Returning to Languedoc in December 1215, he informed his followers of the council's mandate that there be no new rules for religious orders. As a result the community adopted the rule of St. Augustine, which, because of its generality, easily lent itself to any form they might wish. In August 1216 Domingo returned to Rome and appeared before Pope Honorius III to solicit confirmation for his order. The bull of confirmation was issued on 22 December 1216.

In 1218, to facilitate the spread of the order, Pope Honorius III addressed a bull to all archbishops, bishops, abbots, and priors, requesting them to show favor toward the Order of Preachers. Later Honorius bestowed the Church of Saint Sixtus in Rome upon the order. In February 1219 Domingo founded the first monastery of the order in Spain at Segovia, followed by a convent for women at Madrid. It is probable that on this journey he also presided over the establishment of a convent in connection with the University of Palencia and, at the invitation of the bishop of Barcelona, a house of the order was founded in that city. Shortly before his death on 6 August 1221, Domingo returned to Rome for the last time and received many new, valuable concessions for his order. He was canonized on 13 July 1234 by Pope Gregory IX, who declared him to be as saintly as Peter and Paul.

GUZMÁN, NUÑO DE

The youngest of the illegitimate children of Luis González de Guzmán, master of the military order of Calatrava (1406–1407 and 1414–1443), by Inés de Torres, a wealthy heiress from Zamora, Nuño de Guzmán was educated by private tutor in the maternal home in Córdoba during a period of estrangement between his parents (1416–1430). Under his mother's guidance he became deeply interested in literature, "so that a day spent without reading seemed to me utterly wasted" (*Apologia Nunnii*), but he did not learn Latin. In 1430 he undertook a pilgrimage to Jerusalem and Sinai, returning via Cairo, the Aegean islands, Venice, Rome, Siena, Bologna, Genoa, Milan, Bohemia, Basle, Cologne, Lyon, and Tours before arriving at the court of Duke Philip the Good of Burgundy in Bruges (autumn 1432), where by his own account he was given an important office (*magistratus*), probably in the household of the duke's wife, Isabel of Portugal. On his return to Spain (ca. 1435) Guzmán found himself in the bad graces of his father, despite the personal intervention of Juan II and the support of his mother; consequently he set out for Burgundy again in 1439, but decided to visit Florence first, where the ecumenical council called by Pope Eugenius IV for reunion with the Eastern Church was just beginning. Guzmán was instantly dazzled by the intellectual ferment he encountered in Florence and, abandoning his Burgundian trip in favor of a vocation as literary patron and book collector, he befriended the celebrated *libralo* Vespasiano da Bisticci, Leonardo Bruni, Pier Candido Decembrio, and other humanists. He had Bruni's apologetic life of Cicero (*Cicero Nouus*) and his humanist version of Aristotle's *Ethics* translated into Tuscan, and received the dedications of Decembrio's Italian translations of Seneca's *Apocolocyntosis diui Claudii* and Quintus Curtius's *Life of Alexander*, while commissioning many superb *lettera antica* manuscripts from Vespasiano's *bottega*. In later years, Vespasiano tells us, Guzmán continued to commission Tuscan translations of classical and humanistic works, among which we know of Quintilian's *Declamationes maiores* (1456), Cicero's *Disputationes Tusculanae* (1456) and *De oratore* (date unknown), and Macrobius's *Sanumalia* (1463 or later). The most important fruit of his Florentine visit, however, was his personal friendship with the humanist Giannozzo Manetti (1396–1459),

who dedicated his *De illustribus longaevis* (1439) to Guzmán's father and his pathfinding Plutarchan parallel lives of Socrates and Seneca to Guzmán himself (1440, with notes on Seneca's Córdoba connections supplied by the addressee). In addition, Manetti cast two works into humanist Latin from notes prepared by Guzmán (1439); *Apologia Nunnii*, an autobiographical selfjustification addressed to his father, and *Laudatio Agnetis Numantinae*, an extended eulogy of his mother supposedly replacing a lost *alabanza* (works of praise) by Enrique de Villena. After returning to Seville in early 1440 Guzmán corresponded on literary matters with Alfonso de Cartagena, Alfonso de Palencia, and the Marquis of Santillana. The only works definitely attributable to Guzmán's own hand are his translation of Manetti's epideictic Tuscan oration on the qualities of the military commander, *Orazione a Gismondo Pandolfo de' Malatesia* (1453), made for the Marquis of Santillana (c. 1455); a revision of the Alfonsine translation of Seneca's *De ira* made (probably) for his mother (1445); and a highly popular vernacular compendium of Aristotle's *Ethics* made for his brother Juan de Guzmán, *señor* of La Algaba, (1467) and subsequently copied and printed a number of times either without attribution, or under false ascriptions to Alfonso de Cartagena and Alfonso de la Torre. It is highly probable, however, that Guzmán was instrumental in the Castilian translations of Bruni's *Vita di Marco Tullio Cicerone* and of Decembrio's versions of the works by Seneca and Quintus Curtius mentioned above, as well as the dissemination of other classical texts. When Guzmán died in Seville at some date between 1467 and 1490, Vespasiano tells us in his curious *Vita di messer Nugno di casa reale di Gusmano* (our fullest contemporary source) that Guzmán's splendid library came to a bad end. Nevertheless, Schiff's judgment that he was one of those to whom early Spanish humanism owed the most is fully justified.

H

HAFSA BINT AL-HAYY AR-RAKUNIYYA

A poet who lived in Granada in the twelfth century, Ḥafsa belonged to a noble family and received a superior education, which enabled her to become a teacher later in life. Like Wallādah, she was the lover of a poet, Abū Yafar, and many of her poems take the form of a dialogue with him. For example:

Shall I go to your house, or will you come to mine?
My heart always goes where you desire.
You may be sure you will not be thirsty or hot when
you meet me.
A fountain fresh and sweet are my lips, and the
branches of my braids cast a thick shadow.
Answer me quickly, for it would be wrong to make
your Butaynah wait, oh, my Yamil.

No less loving than the famous poet Yamil to his beloved Butaynah, Abū Yafar replied to Ḥafsa:

If I can find a way, I will go to you.
You are too important to come to me.
The garden does not move, but receives the soft puff of
the breeze.

Ḥafsa also was being courted by the governor, Abū Saʿīd, whose great passion for her she did not dare reject, and probably enjoyed to some extent. Mutual jealousy caused the relationship between Abū Saʿīd and Abū Yafar, who was his secretary, to deteriorate. Eventually the former had the latter killed. Despite the danger, Ḥafsa did not hide her grief, and wrote the following lines:

They threaten me for mourning a lover they killed by
sword.
May God be merciful to one generous with her tears
or to her who cries for one killed by his rivals,
and may the afternoon clouds so generously drench the
land wherever she may go.

After Abū Yafar's death Ḥafsa went to Marrakech, where she became tutor to the princesses.

All seventeen of Ḥafsa's known poems were written in the earlier part of her life. Although she produced

some satirical and panegyric poems, most of her works are love poems, at which she excelled. Of the almost forty women poets of al-Andalus, Ḥafsa is the most representative and the best known.

HAGIOGRAPHY

Medieval hagiography differs from the part of modern historiography that consists of scientific research on the lives of saints. If medieval chronicles in general very often included legendary components, the conventional patterns and the appeal to wonder operated especially in the lives of saints.

The oldest data on the custom of reading hagiographic texts in the church have been interpreted as readings during the Mass, and though testimonies of this kind are scarce later than the eighth century, there is a Hispanic particularity: in Mozarabic liturgy such a custom is documented until the eleventh century. Those readings were most frequent in matins, and apart from other offices, they must have occurred in convents during meals and work. Therefore the audience of hagiography consisted fundamentally of the religious living in communities. The rest of the faithful received the hagiographic stories through the examples that preachers took from legends, especially from the thirteenth century on.

In terms of a wider diffusion, minstrels may have included lives of saints, as well as *chansons de geste*, in their repertoires. Hence, the hagiographic poems of the *mester de clerecía* could have been recited on pilgrimages. In any case there is no doubt that the new dimension of hagiography in Romance languages which began to develop in the thirteenth century indi-

cates the desire that it be accessible to everyone, not just to those who were fluent in Latin. Provisional data show that the references in Spanish and Catalan account for one-third of the total in the first century of vernacular hagiography, and reach 75 percent of all hagiographic production in the fifteenth century.

Though the first examples of Castilian hagiography were written in verse, by the fourteenth century prose prevailed. The reading aloud or the recitation of the poems seemed inadequate for prose, which tended to be linked with private reading. However, prose did not imply a decline in the popularity of the hagiographic genre, since the legends had become part of common knowledge thanks to the poems. On the other hand, as the Renaissance approached, the custom of private reading increased, facilitated in this genre by the *flores sanctorum*, abbreviated compilations that proliferated in the fourteenth and fifteenth centuries, most of them following Jacopo da Voragine's *Legenda aurea*.

The Castilian hagiography has a generic character that could coincide with that of Latin hagiography or any other field of medieval literature. Since every hagiographic writing is the story of a sanctification process, its internal structure may be put in a sequence of three parts: the wish for sanctity, the improvement process, and the proofs of success (miracles while living, death, and postmortem miracles). The basic type of lives of saints is the one represented by Gonzalo de Berceo's writings devoted to San Millán and Santo Domingo de Silos. Sometimes the structure becomes more complicated when the narration of an earlier, impious life is included. The meaning of the story would be similar to that of other hagiographic writings, with the only difference that, in the *Vida de Santa María Egipciaca*, for example, the starting point is not a positive degree of sanctity, but a very negative one, a violent contrast that would appeal to the reading public.

There is another type of hagiography that, though following the same basic structure, is developed more in the other world than in this one. Perhaps the most famous example of vision literature is the *Poema de Santa Oria*, by Berceo, to which could be joined a story linked with travel literature, the *Vida de San Amaro*. In addition, the *Martirio de San Lorenzo*, by Berceo, and the *Vida de San Vitores*, by Andrés Gutiérrez de Cerezo, are late examples of what was the predominant hagiographic form in Iberia until the tenth century: the literature of martyrs. The passions present a story centered on the execution and its preliminaries, a specific and violent opposition between the sacred and the profane, opposite to the gradual developing of the lives of "confessors."

The hagiographic story of course centers on the saint; the rest of the characters serve to enhance the success of his life and fall into two dichotomous categories: supporters or antagonists of sanctity, and human or supernatural. Type characters that belong to those categories are parents, teachers, members of the religious community, authorities of the ecclesiastical or civil hierarchy, those who benefit from miracles, God, Christ, the Virgin Mary, and the rest of the heavenly court: and invidious clerks, deceivers, Moors, heretics, powerful people, and the devil, the enemy par excellence.

The analysis of the structure, characters, and vision of the world in Castilian hagiography shows that its essential meaning is the subject's life as an example. Nevertheless, the greater glory of the saint also confers benefits on the local centers that were connected with him or sheltered his relics. The ecclesiastical institutions that profited from these stories ranged from dioceses to religious orders to monasteries. The *Vida de San Millán* and *Vida de Santo Domingo de Silos*, by Berceo, are two very good examples because of their explicit mention of the tributes.

AL-ḤAKAM II, CALIPH OF CÓRDOBA

Al-Ḥakam II b. 'Abd Al-Raḥmān III ruled as caliph of al-Andalus from 961 to 976 with the throne name of Al-Mustanṣir. His reign is noted for its political continuity and cultural production.

Al-Ḥakam II was designated his father's successor as early as 919 at the age of four. Though 'Abd al-Raḥmān III lived for forty-two more years, Al-Ḥakam II participated actively in the caliph's administration and gained a breadth of experience in the palace and on military campaigns. By the time he came to power in 961, Al-Ḥakam II had witnessed his father's consoli-

dation of power and understood well how to maintain it. He was particularly adept at delegating administrative duties and was fortunate to have many political advisers and military leaders that he could trust.

Al-Ḥakam II's most significant political achievements involved maintaining the borders in the north, co-opting the majority of the powerful provincial families into the Córdoba aristocracy and military, and subduing the Idrīsīds of Morocco. The only real outside threat he faced was a raid by the Vikings in 971, which was quickly repelled. He continued the practice of obtaining soldiers from outside al-Andalus but turned south, recruiting Berber horsemen from Morocco instead of buying slaves from the north. Either more pious or more recognizant of the vital political role of the Muslim jurists than his father was, Al-Ḥakam II often consulted the leading *faqīhs* of al-Andalus, and their power increased significantly during his reign. Al-Ḥakam II gained enough esteem among the Christian kings to the north that they regularly solicited his arbitration in their own disputes. The mother of his only son and heir, Hishām II, was a Basque princess. Al-Ḥakam II sent the Jewish doctor Ibrāhīm b. Jacob on a diplomatic mission to Otto I and commissioned the translation of the Talmud into Arabic.

Al-Ḥakam II is better known for his patronage of the arts and culture than he is for his political exploits. His library of over 400,000 volumes and a forty-four-volume catalog was one of the largest Islamic collections of the time. Al-Ḥakam II was himself a fairly good poet, and during his reign Córdoba became one of the leading centers of Islamic culture. He encouraged the study of astronomy and mathematics at the increasingly opulent court of Madīnat al-Zahrā, the palace complex outside Córdoba that his father had built. The Byzantine mosaic workers he continued to import to adorn Madīnat al-Zahrā worked as well on the Great Mosque of Córdoba, which Al-Ḥakam II enlarged yet again.

Al-Ḥakam II suffered a stroke in his latter years, and this might account for his not providing his young heir Hishām II with the political training and confidence that had proved so important in Al-Ḥakam's own reign. Al-Ḥakam II died in 976 leaving the fifteen-year-old Hishām II to the mercy of the increasingly powerful *hājib* (chamberlain) Al-Manṣūr. Although al-Manṣūr provided strong leadership from Córdoba until his death in 1002, the weakened Umayyad caliphate only lasted another thirty years.

HALEVI, YEHUDA See YEHUDA HA-LEVI

HARO FAMILY

Descended from Iñigo López, the *mayordomo* of King Sancho III of Navarre (r. 1000–1035), the Haro family first came to prominence in the region that overlapped the modern Spanish provinces of Vizcaya, Álava, and Rioja. The twelfth century marked the emergence of the Haros as important officials in the courts of both the Navarrese and the Castilian kings. Diego López de Haro had a long official career that centered on his post as count of Nájera. His grandson and namesake, the royal standard-bearer (*alférez real*) for the Alfonso VIII of Castile, played crucial roles as commander of the rear guard at the Battle of Alarcos (1195) and as commander of the vanguard in the Battle of Las Navas de Tolosa (1212).

The thirteenth century saw the extension of Haro power eastward into Aragón as a cadet branch of the clan, the Azagras, became lords of Albarracín and Tragacete, and proved to be extremely rebellious subjects of the monarchs of the Crown of Aragón. The Haro clan's base, however, remained Vizcaya, and their power was derived from the offices they held in the Castilian court and parliament. The most important of these was that of standard-bearer, a post held by a Haro throughout the Middle Ages.

Undoubtedly the most influential of the thirteenth-century Haros was Lope Díaz de Haro, the nephew of the hero of Las Navas, who used his position in the court of Sancho IV of Castile to expand the power of his family at the expenses of its archenemies at court, the Laras. His cruel regime precipitated a wide-ranging revolt of the brotherhoods (*hermandades*) of the Castilian nobility in 1286–1287. Though the royalist forces under Haro were able to put down the Lara-led revolt, the unity of the victors soon began to unravel in 1287. When Haro showed himself to be an unreliable vassal, he was killed by other members of Sancho IV's retinue.

The fortunes of the family were saved with the escape of Lope's brother, Juan López de Haro, who became a leader of the Castilian noble brotherhoods in the early decades of the fourteenth century and, in that position, dominated the activities of the Castilian *cortes* and the royal court of Sancho IV's son, Fernando IV. In the later decades of the Middle Ages and into the early modern period, the Haros remained significant court agents who through marriage became allied to such highly placed officials as the Count-Duke of Olivares.

HEBREW LANGUAGE AND LITERATURE

Language

Hebrew as a spoken language fell into desuetude in the Diaspora as early as the biblical period, and in Palestine itself during the Greek and Roman eras. Jews in Visigothic Spain spoke the language of the people, and following the Muslim conquest (711) began using Arabic, already the dominant language of the majority of the Jews in the world. However, in part as a response to the 'Arabiyya reaction in the Muslim world, in the tenth century there was a nationalist revival among Jews of al-Andalus that gave rise to the first scientific study of Hebrew grammar and lexicography and resulted in a renaissance of the Hebrew language—not as a spoken language but for literary purposes. Menahem ibn Sarūq and his opponent Dūnash ibn Labrat and their students engaged in heated controversy from which there gradually emerged a correct knowledge of Hebrew grammar.

Judah ben David Hayyūj (11th century), probably a teacher of the famous poet Samuel ibn Naghrilla, and Judah ibn Balsam were two of the important grammarians of the next generation. However, it was Jonah ibn Janāh who dominated that generation, with his works on grammar and his Hebrew dictionary, the first accurate one of its kind. Moses ibn Ezra, renowned poet of Granada, names Ibrahim ibn Saqtar as one of the two greatest grammarians, along with Ibn Janah. Isaac ibn Barūn (twelfth century) was another great grammarian; his *Kitāb al-muwazanah* marks the first scientific effort at comparative linguistics (Hebrew and Arabic), although his predecessors, particularly Ibn Janāh, drew heavily on their knowledge of Arabic in analyzing Hebrew. Later important contributions were made by Abraham ibn Ezra, David Kimhi, Joseph ibn Caspi, Profiat Duran, and others.

However, the foundation of Hebrew grammar had been firmly established by the end of the twelfth century. All of these works on Hebrew grammar, except for the dictionary of Menahem, were written in Judeo-Arabic and later had to be translated into Hebrew,

chiefly for use in Provence and Aragón-Catalonia in the later medieval period when Arabic was no longer known.

Nowhere in Spain, of course, did Hebrew become a commonly spoken language. Spanish was everywhere the language of the Jews, with Arabic prevailing as a strong secondary language in Castile, particularly in Toledo. However, the Hebrew renaissance showed itself in biblical commentary, poetry, and literature; these in turn influenced the style of Hebrew writing not only in scholarly treatises (rabbinic, philosophical, or scientific) but also in the everyday letters of the people.

Some Christians became proficient in Hebrew. "Schools" of Hebrew (actually single teachers at various monasteries) were established by the Dominicans, and to a lesser extent by the Franciscans, in the thirteenth century. Such instruction was usually given by *conversos* (converts to Christianity), but in some cases by Jews (as at Murcia, Barcelona, and Valencia); at Játiva in 1302–1303 a Christian taught Hebrew and a Jew taught Arabic (earlier a Jew had been the instructor in Hebrew there). There also were Christian noblemen who learned Hebrew for its own sake. Juan Fernández de Ixar, author of the *cancionero* that bears his name, was one of these; the important Aragónese Jewish poet Solomon de Piera addressed Hebrew poems to him. The daily contacts between Jews and Christians, and the necessity for the kings to know Jewish law, explain the ever-increasing number of Hebrew words that became part of the standard Spanish vocabulary in the medieval period, some of which survive in modern Spanish. The fifteenth-century *cancioneros*, of course, containing many poems by *conversos*, are full of Hebrew terms, but this may not be evidence of a general knowledge of these words in the way that unquestionably is the case with royal and other documents.

Literature

The first problem is to define precisely what is meant by "literature." Even Hayyim Schirmann, the great authority on Hebrew poetry and literature of medieval Spain, included as "literature" Hebrew works that were essentially philosophical or educational, simply because they were written, in part or in whole, in rhymed prose.

By "literature" we understand a work of fiction, clearly recognizable as such, that, while it may have a secondary aim of moral instruction, is primarily intended to entertain. In the case of the Hebrew literature of medieval Spain, we can be even more specific, since it is invariably of a single genre, borrowed from the

Arabic. This is *maqāma*, a term of unclear origin, perhaps meaning “sitting” or “standing.” In any case it appears to refer to the recital of tales to an audience. The style was first used in the ninth century, apparently by Al-Jāhiz, but the Muslim authors with whom the style is most associated are Al-Hamadhānī (967–1008) and Al-Harīrī (1045–1122), whose *maqāmāt* was translated into Hebrew by Judah al-Harizi.

The characteristics of this style, whether in Arabic or in Hebrew, are rhymed prose interspersed with actual poetry (metric); obviously fictitious, even mythical or legendary, names of heroes; a protagonist who is often the author himself (particularly in the Hebrew form); and an antagonist who is a trickster and almost always a mythical or “nonreal” person.

The first known Hebrew *maqāma*, which has not survived in its entirety, is that of Solomon ibn Saqbel (mid-twelfth century). A unique feature of the Hebrew form, which was to be imitated by his successors, was the parody of the biblical prophetic “call,” where God (or at least a voice) addresses the author in pseudoprophetic language, in an amusing manner, to arouse him to his task. Ibn Saqbel also set the tone of this genre in Spain, where, unlike the relatively few examples of Hebrew literature from other lands, these stories are totally secular, with no religious or moral elements of instruction whatever. Indeed, love and sex play a prominent role in almost all the Hebrew *maqāmāt*. The element of deceit is also central. One of the most entertaining stories, for example, finds the hero enticed into a harem where he believes the most beautiful woman is madly in love with him. To his surprise, he finds that this “beauty” is a man disguised to trick him; it is, of course, the mythical antagonist. The skill of the author is manifest in having already planted clues to alert the careful reader and arouse suspicion before the trick is revealed.

Interestingly, the second Hebrew *maqāma* that has survived comes not from al-Andalus but from Barcelona: Joseph ibn Zabara’s (twelfth century) *Seferhasha Cashucim* (*Book of Delights*; available in a poor English translation, a very good Catalan translation, and a fairly good Spanish one). While generally lacking the humor, and certainly the outright sexuality, of the Andalusian examples, this work is rightly considered one of the most important of Hebrew literature. (Its supposed influence on the *Libro de buen amor* is, however, highly doubtful.)

Judah ibn Shabbetai (thirteenth century; Toledo and Zaragoza) introduced another important motif that was to have a lasting influence in Hebrew literature and may, indeed, have influenced subsequent Spanish literature: the wiles, or deceitfulness, of women. His totally fictitious work was taken seriously in Provence,

where it aroused several responses defending women. We find thereafter many humorous tales of women that demonstrate not so much their deceitfulness as their cleverness and quick wit in turning a potentially dangerous situation (usually sexual) to their advantage.

Judah al-Harizi, known also for his poetry and particularly for his Hebrew translation of Maimonides’ *Guide for the Perplexed*, composed the largest example of the genre, *Tahkemoni* (available in a good English and a recent Spanish translation). This work accurately reflects his own travels but is interspersed with many humorous fictitious tales and includes a chapter of great importance on Hebrew poets.

Of major importance also is the work of Isaac ibn Sahulah of Guadalajara (ca. 1281), *Meshal ha-qadmoni* (*Tale of the Ancient One*), which contains many delightful tales and became one of the most lavishly illustrated Hebrew books.

Jacob ben El’azar of Toledo (early thirteenth century), who also composed a Judeo-Arabic grammatical treatise, produced a *maqāma*, unfortunately not complete, which ranks alongside that of Ibn Saqbel for sheer entertainment and brilliance of style. Problematic are some works that, while definitely in the *maqāma* style, may not entirely fit the definition of “literature” we have suggested. One of these is *Ben ha-melekh ve-ha-nazir* (*The Prince and the Ascete*) of Abraham ibn Hasdai (Barcelona, early thirteenth century). This is, in essence, a translation of an Arabic version of the Barlaam and Josaphat stories, apparently through an intermediary (Persian?) version. However, Abraham has added much of his own material to the work. Nevertheless, in the final analysis it belongs more in the realm of didactic and ethical writing, of which there are many other examples, such as the two Hebrew versions (one by the above Jacob ben El’azar) of the *Kalīla wa-Dimna*.

Still problematic is the *Mishley sendebar* (*Tales of Sendebar*; available in English and Spanish translations). While this anonymous composition probably was written in Spain, its style is crude in comparison to other *maqāmāt*. The Hebrew version is hardly the “original,” as claimed by its editor but derives from a lost Arabic version that has been heavily reworked in a pseudobiblical style.

Some minor examples exist from Provence, where this style of Hebrew literature was extremely popular. In fourteenth- and fifteenth-century Aragón-Catalonia, the *maqāma* had a brief revival (En-Maimon Gallipapa, Vidal Benveniste, Vidal Alrabi, and others), but these works are less satisfying from a literary point of view, however historically important they may be.

HENRY OF BURGUNDY

Count of Portugal from 1093 to 1112, Henry was married to Teresa, natural daughter of Alfonso VI of León-Castile, who was his consort and successor. Together with his cousin, Count Raymond of Burgundy and of Galicia, he was a major court figure until the death of Alfonso VI in 1109. He and his wife then began an attempt to replace Teresa's half sister, Urraca (r. 1109–1126) on the throne of the kingdom. This sometimes involved alliance with Urraca's estranged husband, Alfonso I of Aragón, and at others with the supporters of Alfonso Raimúndez, Urraca's young son by her first husband, Count Raymond of Burgundy. Henry died before 22 May 1112, at Astorga, probably as the result of the fighting near that city. He was the younger brother of Duke Eudes I of Burgundy and probably had come to Iberia in the entourage of that magnate in the late winter or spring of 1087. His career is obscure before his appointment to the county of Portugal, but about 1095 he had conspired with his cousin to partition the kingdom of León-Castile at whatever time Alfonso VI should die.

HENRIQUE, PRINCE OF PORTUGAL

Conventionally known as "the Navigator," Henrique was born in Oporto (Portuguese: Porto) on 4 March

1394. His father, João I, was a bastard who had fought his way to the throne. The chivalric culture of the court in which Henrique grew up cloaked the imperfections of the new dynasty's credentials.

As the fourth of the king's sons, Henrique had no prospect of the crown. He had, however, the example of his grandfather, John of Gaunt, who maintained an affinity of kingly proportions and sought a crown of his own in Spain through wars, conducted to resemble knightly cavalcades. Though little direct evidence survives of Henrique's life up to 1415, the priorities of an upbringing dominated by knightly exercises are conveyed in the treatise on chivalry attributed to his eldest brother. The chivalric ideal informed his whole career. Though he was later obliged to become involved in commerce and industry in an effort to maintain his estate, he always projected the self-perception of a perfect knight, espousing celibacy, practicing asceticism, and professing religious motives for slave raids and attempted conquests.

After contemplating a tournament of unprecedented magnificence to celebrate the knighting of his

sons, the king decided in 1415 to launch instead a real *chevauchée* (chivalric attack) against a traditional enemy, the Muslims of Ceuta. The princes themselves were said to have urged this change of plan. The chronicle tradition assigns Henrique a prominent part in the conquest and in the next few years he earned offices of honor and profit comparable to those of his brothers. By 1423 he was the duke of Viseu, the governor of Ceuta and the Algarve, and the administrator of the Order of Christ. He remained, however, a cadet prince with an ill-defined role who chose to reside away from court, chiefly in the Algarve, and to surround himself with a retinue of "knights" and "squires" whom he maintained at great cost and no small trouble: documents concerning crimes by members of his household cover murder, rape, and piracy. This entourage was not only evidence of Henrique's pretensions; it also committed him to a quest for patronage with which to reward his followers.

His ambitions are suggested in a memorandum addressed to his father in April 1432: the Count of Arraiolos, who knew Henrique well, observed that he might acquire a kingdom in Morocco, Granada, Castile, or the Canary Islands, "and have the affairs of this kingdom [Portugal] in the palm of his hand." Little survives of any writing of Henriques's own, but the two probably authentic memoranda from his pen recommend crusades against Tangier and Málaga. His attempt to conquer Tangier in 1437, however, was a costly failure, and thereafter he concentrated on alternative fields of endeavor in which he had already dabbled: maritime deeds and, in particular, his effort to acquire a realm in the Canary Islands.

Many chivalric romances of the period had a sea-borne setting, and a common denouement placed the hero in an island-kingdom. Portuguese ports had played a part in the exploration of the eastern Atlantic since the 1340s and there is evidence in chronicles and maps that Portuguese navigation intensified in that arena in the 1420s. That Henrique was already involved is an assertion of a chronicle he later commissioned. In the following decade, however, independent documents confirmed his interest. In 1432 his claims to the Canaries led the pope to solicit opinions from jurists on the question of the legitimacy of war against the pagan inhabitants. It is evident from friars' protests that Henrique's career as a slaver, to be continued in the next decade on the African coast, began in the Canaries by 1434. His efforts to secure a base in the archipelago continued with few interruptions almost until his death but were rewarded with no permanent success: some islands remained in the natives' hands, others in those of Castilian adventures or settlers.

After his father's death in 1433, the sense of vocation attributed to him by contemporaries seems to have deepened. He felt destined for great deeds by his horoscope—his chronicler tells us—and endowed, by inheritance from King João, with a "talent" that had to "shine forth." Portuguese ambassadors in 1437 told the pope that Henrique's aim was "expressly to fulfil the image and likeness of King João." Between 1438 and 1449, all his surviving brothers died. The death of the Infante Fernando, in captivity in Fez in 1443, was a heavy charge on his conscience, for Fernando was a victim of the debacle at Tangier and Henrique had opposed the possible surrender of Ceuta in ransom. In adopting a homonymous nephew as his heir, he shouldered a fatherly responsibility. In 1449 he became the senior surviving prince of his line when his elder brother, Pedro, fell in rebellion against the crown.

Meanwhile, he had accumulated resources to invest in his offshore activities. As well as the income from the Order of Christ and the revenues of his many fiefs, he controlled extensive fishing rights, including the monopoly of the tuna-curing industry of the Algarve; the monopoly of soap manufacture throughout the kingdom was his, as was that of coral gathering off Ceuta. His maritime activities were exempt from the royal tax on booty and he had the sole right to license voyages to Madeira, the Azores, and the Atlantic coast of Africa.

These arenas occupied an increasing amount of his attention as his prospects in Morocco and the Canaries waned. He expressed interest in settling a colony on Madeira as early as 1433; in June and July 1439, seed and sheep were shipped to Madeira and at least one of the Azores; thereafter, colonization was farmed out to enterprising intermediate lords, who were normally Henrique's dependents (though his brother and nephew were the superior lords in some cases). Henrique was a partner in the building of the first recorded sugar-mill in Madeira in 1452: this made him a founding patron of an important new industry of the late Middle Ages.

Meanwhile, navigation under Henrique's patronage, or with his license, extended along the African coast. The chronicle he commissioned established the belief, which historians continued to uphold until very recently, that African exploration was the primary focus of the prince's endeavours. The much-vaunted rounding of Cape Bojador in 1434 was a minor by-product of the effort to sieze the Canaries; to judge from surviving maps and sailing directions, "Cape Bojador" probably signified nothing more remote than the modern Cape Juby. The great series of African voyages began in earnest only in 1441. From the mid-1440s, this enterprise began to yield appreciable

amounts of gold and slaves. Around the middle of the next decade, when Henrique employed Genoese technicians to supplement his household personnel, significant progress in navigation was made when the Senegal and Gambia Rivers were investigated and the Cape Verde Islands discovered. The big advances, however, both in the reach of exploration and the yield of exploitable resources, came in the generation after Henrique's death, as Portuguese navigators worked their way around Africa's bulge. Meanwhile, in 1458, Portugal's crusading vocation in the Maghrib was briefly revived and Henrique accompanied the royal expedition that seized Al-Qasr Kebir, near Ceuta.

Henrique died in Sagres on 13 November 1460. The Canaries still eluded him; no crown adorned his head; of the gold of Africa only a few threads had come within his grasp; and he was heavily in debt. He had, however, invested wisely in posthumous fame and has enjoyed an enduring reputation as Portugal's culture hero, credited anachronistically with the foundation of the Portuguese Empire and with the inauguration of a tradition of scientific exploration. Modern scholarship disavows these claims, but as a patron of the colonization of Madeira and the Azores he can genuinely be counted among the creators of Atlantic colonial societies.

HERALDRY

Studies dedicated to heraldic emblems and armorial bearings have almost been reduced to the merely descriptive, focusing overwhelmingly on formal aspects. From a historical point of view, however, the human aspects—the use of these emblems on a societal level, and the reasons they were represented and displayed in such a wide variety of cultural circumstances in different countries and ages—are much more interesting.

Armorial bearings were initially personal distinguishing marks that could be passed on to other people. The channels of this transmission were social structures, and the fact that the emblems were transferred indicates the existence of an essential hierarchy within the structure. Transmission by inheritance within the

most immediate social structure, the family, caused these emblems to acquire a double meaning, both personal and familial. The continuous inherited possession of territorial jurisdiction also caused the armorial bearings to be affiliated with specific geographic territories, a third meaning added to the first two. Finally, the hierarchical nature of these social structures meant that the armorial bearings were often passed from superiors to their subordinates. Naturally, the different ways that these transmissions were adopted in each period and in each country reveal how the social structures from which they arise were understood.

The period in which the heraldic emblem began to be widely used is roughly the same in the Iberian Christian kingdoms and in the countries of the English Channel: the south of England and continental territories from the north of France to Rhineland Germany. In Iberia, this occurs during the latter part of the reign of Alfonso VII, between 1135 and 1157, coinciding with the favorable circumstances caused by the political union (under Alfonso's rule) of territories from Galicia and Portugal to Gascony and Languedoc. In short, the phenomenon was yet another manifestation of the progressive movement that became known as the twelfth-century Renaissance. There is evidence showing that Alfonso VII, King of León and Castile, used a lion as a heraldic emblem, and that Ramón Berenguer IV, Count of Barcelona and Prince of Aragón, used a paled shield.

In the first stage of the evolution of heraldry, there was significant diversity, not only in the graphic patterns of the emblems, but also in the material foundations upon which they were represented, as well as in the meanings and purposes for which they were used. In a later stage, these different purposes were fused, forming the thirteenth- and fourteenth-century conception of heraldry familiar to the modern student. This development occurred more slowly in Iberia, making it easier to follow the successive phases of the process than it would be in other European regions. The plural nature of heraldic history, combined with the notably rapid diffusion of the heraldic emblem's use outside the military, suggest that there has been an exaggerated importance placed on the emblem's usefulness as a means to recognize soldiers whose faces were hidden. Much more effective is the use of the armorial bearing as an indication of fashion tendencies and as a source of aesthetic value.

The use of heraldry becomes rooted in society with the emblem's increasing presence outside the military sphere. This made the heraldic emblem available to those that had no connection with the world of war, and gave rise to the use of armorial bearings on everyday objects and in everyday occasions. In terms of

quantity, this newfound domestic availability was very important: civil heraldic representations were much more numerous than their military counterparts, and were created on much more durable materials. Consequently, their influence in the configuration of the heraldic system was much greater. Previously, these emblems were not conceived as abstractions that preceded their visual, material manifestations; they were merely created and developed in the moment of execution, and not in some preexistent theoretical plane.

The structuralizations of the society and family in different countries had direct repercussions in the way the heraldic emblems were used. In France and England, heraldry took on a strongly personal character: each coat of arms represented one person exclusively, and only the eldest son could inherit the unaltered emblem. In the Hispanic world, on the other hand, the heraldic emblem belonged to all individuals sharing the same lineage, and any of them could use it in its pure, unaltered form. The reason for this discrepancy is that the use of a particular coat of arms in Anglo-French regions was considered to be directly linked to the possession of feudal territory. In Iberia before the fourteenth century, only the coats of arms of certain kings were considered to be connected to the territories they owned.

The heraldic emblems' definitive installation in society seems to depend not only on those that used them, but also on a more general penchant for heraldry that spread throughout Western Europe during the last stretch of the twelfth century and the beginning of the thirteenth. Heraldic manifestations in literature and the plastic arts demonstrate the varied characteristics the emblem had in different countries. In the territories of the English Channel, interest in heraldry was aroused by the admiration of chivalry. The coats of arms of the most famous figures were well known, reproduced, and collected by many people from various social classes. In Hispanic territories this interest was based more on an increasing awareness of the decorative value of the heraldic emblems; this aesthetic regard for heraldry was especially strong during the reigns of Fernando III and Alfonso X in the southern regions of Castile, from Toledo to Seville. During this period, repetitive ornamental patterns inspired by Mudéjar art were formed. These patterns allowed two coats of armor to be assembled in one shield, a useful development since maternal and paternal emblems were habitually incorporated together because of the emblem's familial nature. The quartering of the shield to incorporate two family crests was a Castilian invention that later spread throughout Europe, as was the charged bordure.

The Anglo-French interest in heraldry, founded in a more general passion for chivalry, had two important consequences. The frequent description of the armorial bearings in literature, used to establish a narrative setting, gave rise to the formulation of a specific heraldic vocabulary with its own terminology and expressions. In addition, the tradition of collecting coats of arms led to the birth of the heraldic index or armorial. Because these premises were not in place in the region, the Iberian Romance languages did not have their own original heraldic terminology and did not display an early tradition of heraldic books.

Because heraldry was not associated with a specific economic class in Iberia, the use of the emblem in the peninsula was initially unhampered by social prescription. In the early age of Iberian heraldry, the very concept of the right to use armorial bearings as a prerequisite to actually using them made little sense. Anyone who needed to display heraldic emblems in a given occasion, place, and on a given object could do so. Even the Jewish and Moorish populations residing in Christian territories used coats of arms in their seals.

A new era for peninsular heraldry began in the middle of the fourteenth century, when the formal models and concepts used by the Anglo-French nobility reached the Iberian kingdoms. This influence started in Navarre and Catalonia; Portugal would later be directly influenced by England. The first consequence of this shift was the heraldic emblem's increasingly personal character. The shield containing the family coat of arms would now appear surrounded by ornamental elements like *timbres* (helmets, crowns, crosiers), insignias designating rank, collars of various knightly orders, and so on. In these and other exterior elements, two functions are combined: a signifying function individualizing the coat of arms, and an ornamental function that displayed a fondness for the complicated, the ostentatious, and the surprising. The predominance of the individual character of the emblem is also evident in the use of the *divisa*, a type of emblem that came into use at the same time as the armorial bearings.

The final stage of development occurred in the early fifteenth century, assuring that the use of heraldry would survive into the modern era. In this period, emblems acquired a strong noble connotation; ever since, the presence of armorial bearings signified first and foremost that the user belonged to a distinguished social class, with only a secondary personal or familial meaning. With this new characteristic, heraldry also attains a sense of nostalgia for the past that it had not had previously, as well as the popular belief that the symbols and colors on the coat of arms perpetuated the memory of an ancestor's deeds. This way of think-

ing gave rise to the creation of legends that sought to explain the heraldic emblems as graphic expressions of heroic or portentous acts. Of course, nobody in the twelfth or thirteenth centuries ever adopted a specific emblem for the express purpose of reminding descendants of such deeds. Another important consequence was that once the emblems were considered marks of honor and nobility, their regulation belonged to royal authority, unlike the free use permitted and practiced previously.

HERBALS

Herbals are manuals that deal mainly with plants, but also with elements of mineral and animal origin (*simples*—i.e., primitive elements, uncompound substances; Latin, *simplicia*; Arabic, *adwīya mufrāda*). They provide information on the appearance of these elements, their nomenclature, how to identify them, where they are found, and, primarily, their medical properties and use, often including a strong component of magic and superstition.

The tradition of herbals relevant to the Middle Ages begins in the first century A.D. with Pedanios Dioscorides (*De materia medica*) and Pliny the Elder (*Naturalis historia*, books XII–XXVII). Dioscorides' work survived through various Latin versions, one of which is supposed to have been used by Isidore of Seville. In turn, Isidore's description of plants (*Etymologiae*, book XVII, chaps. 7–11), the first example of herbal literature on the Iberian Peninsula, served as a source for other medieval herbalists.

The Greek text by Dioscorides was translated into Arabic, and became a fundamental text in the Islamic world. In Muslim Iberia the study of Dioscorides became even more important after 'Abd al-Rahmān III received an illustrated Greek manuscript of Dioscorides from the Byzantine emperor in 948. Among the many pharmacological authors are Ibn Juljul al-Andalusi, who wrote a commentary on Dioscorides (982), and Ibn al-Wāfiḍ (1007–1074), who composed a book about the simples (*Kitāb fī l-adwīya al-mufrāda*). His

work was translated into Latin by Gerard of Cremona (twelfth century) and later into Catalan (*Llibre de les medicines particulars*, fourteenth century). Gerard also translated the works of Galen from Arabic, including *De simplicium medicamentorum facultatibus*. Arabic pharmacological writing reached its apex in Al-Andalus between 1150 and 1250 with the extensive and influential works about the simples of Al-Ghāfiqī and Ibn al-Baytār.

In the Christian world one of the most important herbals was the *Circainstans* by the Salernitan physician Matthaeus Platearius (ca. 1150), of which a fragmentary Catalan version is extant. It seems that the most widely influential work on the peninsula was *De virtutibus herbarum*, composed in verse and partly based on Pliny and Dioscorides. The writer's name, Macer Floridus, is a pseudonym alluding to Aemilius Macer, the author of a lost herbal from the first century B.C. The real author was probably Odo of Meun (twelfth century A.D.). There are interrelated prose versions of it in Castilian and Catalan, and the renown of Macer Floridus can also be seen from the fact that an herbal dating from the early sixteenth century was published as *Libro de medicina llamado Macer* (Granada, 1518). As to original works from the peninsula, there are a few minor anonymous ones in Latin, probably of Spanish origin. Arnald of Villanova (ca. 1235–1311) composed a register of medicinal plants (*De simplicibus medicinis*), and he is also the alleged author of some small treatises on individual plants (*Proprietates roris marini*, *Virtutes herbe tunice*, *De virtute quercus*), partly translated into Romance. However, the attribution to him of the authorship of the *Herbarius latinus*, which first appeared in printed versions in the late fifteenth century, is definitely in error.

After the Middle Ages the tradition of herbals in Spain and Portugal survived mainly in three ways. First, classical and medieval herbals appeared in printed editions. Second, Andrés de Laguna composed an annotated translation of Dioscorides from Greek manuscripts (1555), and João Rodrigues de Castelo Branco (Amatus Lusitanus) wrote an important commentary on Dioscorides (1553). In their works are many references to the medieval tradition. Third, the medieval influence is still in evidence also in the works of such authors as Nicolás de Monardes, Francisco Hernández and García de Orta, who composed herbals describing plants, animals, and minerals that could be found in the New World.
